Voluntary Aid and the Red Cross.—Organized voluntary aid may be utilized to supplement the resources and assist the personnel of the Medical Department only through the American National Red Cross. Before military patients are assigned to establishments maintained by the Red Cross, all such establishments will be placed under the immediate direction of a medical officer of the Medical Department.

Administrative Organization in the Theatre of Operations.—The theatre of operations is divided into (a) the combat zone, including the medical and sanitary services of the field armies; (b) the reserve, or corps zone, including all territory from the rear of the combat zone to the base including the base. In a large expeditionary force a chief surgeon general, with a division of all Medical Department activities of the force, including the combat and corps zone activities, is appointed by the Surgeon-General to assist the Surgeon-General in the administration of the Medical Department in the theatre of operations. The organization of the Medical Department in the theatre of operations is: (a) the medical zone, (b) the administrative zone, (c) the communications zone, and (d) the supply zone.
**ARTILLERY—ARTILLERY**

**Sanitary Achievements.**—The value of a medical service in war should be measured, first, by the degree to which it preserves the combat efficiency of the army by its methods, and second, by its success in evacuating and caring for the sick and wounded. In both respects the Medical Department of the American army at the close of the war was superior to that of any army in the world. The death roll from accidents in transportation, smallpox, typhoid fever, and other miscellaneous communicable diseases (excluding tuberculosis and pneumonia), whereas if the Spanish War rates had prevailed there would have been 101,139 deaths, and if the Civil War rate had prevailed there would have been 176,997 cases from these sources.

Care of Sick and Wounded.—In the succor of the sick and wounded great advances were made both in the theatre of operations and in the service of the interior. Personal and fragmentary expansion of the latent organizations was greatly increased. Mobile surgical hospitals were organized and operated close to the front; X-ray examinations were everywhere available; splints for use in transporting fracture cases were enormously improved. Motorization of ambulance service was carried to an extent hitherto undreamed of. Base hospitals were enlarged to accommodate 1,000 patients or more, and were frequently grouped in centres, sometimes aggregating 20,000 beds, including the crisis expansion under canvas. In such centres the individual hospitals specialized, one treating gassed cases, another head cases and other chest wounds, fractures, abdominal injuries, respectively. Laboratories of various kinds on the front and on the lines of communication was expanded beyond all precedent. Professional services were more carefully coordinated and supervised than ever before; the most expert personnel was distributed in such fashion as to meet the requirements, garrison hospitals, etc., for quick transport by automobile or train to points where need was greatest. Veterinary units were augmented in size and number, caring promptly for sick and wounded animals. In the zone of the interior hospital service was brought to the highest standard, the best professional talent of the country was mobilized, and notable progress was made in the treatment of the sick and injured, particularly in the direction of physical reconstruction of the wounded, with a view to returning the individual to the community as a self-sustaining citizen.

Physical Examinations.—Nearly 4,000,000 officers and men were given physical examinations by the Medical Department before admission to the military service and approximately the same number were again examined before demobilization; careful records thereof protect the interests of both the individual and the Government. Valuable data as to the physical status of the nation were obtained from an analysis of these examinations.

**Personnel.**—On April 6, 1917, the Medical Department personnel was not even sufficient for the peace-time needs of the small regular army. The increase is shown in the following table:

| Hospitals.**—When war was declared the army possessed for general and 113 small station hospitals with a total capacity of 6,665 beds. At the height of military activities there were in the United States 47 general hospitals, about 40 large base hospitals (ranging in size from 500 to 3,000 beds each) and a great number of smaller hospitals; the total capacity was over 130,000 patients. In the A.E.F. at the time of the Armistice, Nov. 11 1918, there were in operation 153 base, 66 camp and 12 convalescent hospitals with a bed capacity of 283,555. By Dec. 8 this capacity had increased to 296,865 and with buildings already leased, under construction or authorized, would in due course have reached 423,722, with crisis expansion to 1,541,000. (P. F. C.)**

**ARRIAGA BRUN DA SILVEIRA E PEYRELONGUE, MANOEL JOSÉ P** (1839-1917), Portuguese politician, was born at Horta, in the Azores, in 1839. He was educated at the university of Coimbra, where he took his degree of doctor of laws in 1858. He became known as a strong Republican, and in 1882 was chosen to the Portuguese Chamber for Funchal, in 1890 becoming deputy for Lisbon. His Republic-}

**at the time of the revolution of 1910, and on Aug. 24, 1911 he was elected first president of the Portuguese Republic (see Portugal). He resigned office in 1915, and died March 5, 1917.**

**ARROL, SIR WILLIAM** (1839-1913), British engineer, was born at Houston, Renfrewshire, Feb. 13 1839. In his boyhood he was apprenticed to a smith at Paisley, and worked through several engineering shops until, in 1868, he was able to set up as a boiler-maker. In 1872 he took up construction in steel and started the Dalmarnock ironworks, becoming an expert in bridge-building. The Caledonian Railway bridge at Glasgow, the reconstructed Tay bridge (1852-7), Forth bridge (1882-9), the Tower bridge, London, and the Nile bridge at Cairo were amongst his principal achievements. He was knighted in 1890. He sat in the House of Commons for Ayrshire (S.) as a Unionist member from 1895-1906. He died at Ayr Feb. 20, 1913.

**ARTILLERY (see 2,685).—Before the World War, the general military ideas of artillery procedure and purposes were somewhat the same in all countries. It is proposed here to consider the lessons of the World War in the order in which they were learnt. As the war progressed, fresh problems presented themselves, fresh necessities arose, and artillery methods, equipment, and organization had to be modified to meet them. The war on the western European front may be divided into four phases: a dash by the invader into the enemy’s country; a long period of immobile warfare, both sides entrenched; and the breaking of the line, followed either by retreat and reconstruction or else by the full exploitation of victory.**

The first, or dash, phase of modern warfare was of the greatest importance; it decides whether the campaign is to be fought in the defender’s country or in the invader’s. When one country attacks another, it is the object both of her statesmen and her soldiers to make the initial dash as rapid and effective as possible, so as to finish the campaign in the first stage, and to avoid the long war of attrition which results when two nearly equal armies are entrenched. Similarly, the defender endeavours to crush the invading force at the outset, or to drive it back into its own territory. Therefore, in pre-war preparation, the requirements of trench warfare must be subordinated to those of mobile warfare.

In the World War, at least four-fifths of the main Western campaign was fought in the trenches; and the only seriously contested campaign in which the first phase was carried through to a finish was the invasion of Rumânia by the Germans. Even in Allenby’s brilliant Palestine campaign there was a long pause after the taking of Jerusalem. It seems highly probable that the longest, though not the most important, period of a future war will consist of trench warfare. Speculation as to the effect of new weapons, such as tanks, aircraft, and gas, in changing the nature of war may be misleading as regards the future as it has been in the past, and, at the least, it is necessary, at the present time, to provide for trench warfare as well as for mobile warfare in the training and equipment of an army.

**I. Mobile Warfare.**

**Mobility.**—The initial phase of a war requires a high degree of mobility. Once the invader has left his own railways behind, he must, at first, depend almost entirely on roads. He desires to advance at the rate of 50 miles a day, which is a very different matter from covering 10 m. an hour over short distances. The defender requires an equal degree of mobility to counter the attack. Motor transport for guns and infantry is the only means of attaining this marching pace. As regards the artillery, with which we are here concerned, the gradual disappearance of the civilian “van horse” will, in course of time, make it difficult to keep up horsed guns in peace time, and impossible in war. There is therefore a general agreement that the artillery must become motor artillery. It is obviously impossible to make such a change all at once; the question is which nature formations should be converted first. Before dealing with this point we may consider the types of artillery motor required.
ARTILLERY

The weight of artillery opinion is against the automobile gun-carriage, which is too large to dig in or conceal, and too vulnerable; moreover, the motor is useless when the gun is in action, and might become a target. Parallelism and the long field howitzer have many advantages, and is economical of transport, since the tractor carries the men and first supply of ammunition. The difficulty is that an ordinary Q.F. gun-carriage breaks up when drawn by a tractor at a great speed. Field guns as far as the point where the river has to be crossed. While at the time of the German attack, the French brought up a large number of field guns drawn by lorries. These guns had to be fitted with rubber-tired wheels, which were drawn on the roads, the road being a hollow. Only sufficient horses to bring the guns into action were always available. By the end of the war the French had 266 tractor-drawn batteries of divisional artillery, and 306 batteries on lorries.

The French sometimes adopted a still bolder solution of the problem, namely, carrying the 7-ton caterpillar tractor on a special road lorry. Some authorities are disposed to think that this heroic method offers a better prospect of success than trying to produce a tractor that shall be able to cross country and also travel fast on the road without damage to the surface. For a light caterpillar tractor, capable of pulling a field gun across country, may be made to weigh 50 cwt. or less, so that a large 4-ton lorry can carry both the tractor and a gun. Field guns as far as the point where the river has to be crossed. The method of carrying one motor on another seems so wasteful that it is regarded as a last resource.

The Italians have adopted the following arrangement for carrying guns, which enables them to run the gun over an obstacle, and yet still find the gun seaworthy. The gun is mounted on a chassis, and is attached to a light tractor. A very important factor in the question of the motor transport of artillery is the necessity of using the agricultural organizations of the country. The French have made great use of these organizations to produce an agricultural tractor, mobile on and off the road, which shall fulfill military requirements and shall also be used in very large numbers for agriculture. The introduction of a proportion of automatic fire, and the development of the French system of smoke have prepared the ground for this. The French guns up to the 6-in., and howitzers up to the 9-45 in. inclusive are to be drawn, and the 12-in. and 15-in. howitzers are to be drawn by mobile howitzers. All heavier howitzers are to be drawn by tractor howitzers. The question of artillery transport is more urgent in Italy than elsewhere, since the country produces no artillery draught-horses. Italy is the only country in which horse-drawn artillery has begun to be replaced by motorized artillery; the United States and France, though they used motor artillery during the war, are still only preparing to introduce it as part of their permanent organization. The Italian “dappa” tractor for 4-6 in. field howitzers is one of the most successful chassis for drawing such a gun. The reason why wheeled tractors, not caterpillars, have been preferred is that owing to the nature of the cultivation there is little or no demand for agricultural tractors; the caterpillar type being used on any large scale.

The United States are trying both tractors and automobile gun-carriages; apparently they do not favour platform carriers.

The order of conversion of the different horse-drawn artillery formations to motor transport will probably, in all countries, be on the following lines: (1) All transport which keeps to the road, including ammunition columns; (2) all guns and howitzers heavier than the divisional artillery; (3) army field artillery; (4) all first-line ammunition wagons; (5) guns and fighting battery wagons of the divisional artillery. It is, however, an open question whether army field artillery should not be converted to motor transport first of all, on account of the high importance of having a reserve of field artillery, able to travel long distances at a fast pace, available on the outbreak of war. Such a reserve, it is argued, would add the necessary fighting formations will belong to the artillery and be driven by artillery drivers, not by men borrowed from the general transport corps of the army.

Road-Mobile Super-Heavy Artillery.—One of the first surprises of the war was the reduction of the strong fortresses in Belgium and northern France by the German super-heavy artillery. These siege artillery were designed to resist 6-in. guns and 8-in. howitzers, and the Germans brought up 12-in. and even 16-6-in. (42 cm.) howitzers by road to attack them. The limitations of the transport of heavy loads by road vary in different countries. The British used 22-ton traction engines in the South African War of 1899-1902, at the end of which they were sold out of service as too heavy for English bridges. The bridges on the continent of "national" roads are stronger than most English bridges, and, on some routes, are capable of taking a gross load of 30 tons on four wheels. The 42-cm. howitzer was divided into loads, the heaviest of which was about 20 tons gross. It was no doubt built with regard to the roads by which it would have to travel. A short (25-calibre) 9-2-in. gun or 8-in. gun would make loads of the same weight. However, in France it has been decided, as mentioned above, not to transport super-heavy ordnance by road. These pieces are all to be on railway mountings. The reason for this is the greatly increased range which was demanded of howitzers during the war; thus the British 6-in. howitzer in use in 1914, which ranged 6,000 yd., was replaced by a howitzer of the same calibre ranging 17,000 yd., and a similar increase in range was required of all pieces which, before the war, were classed as siege artillery. It is therefore considered that it will always be possible to find or to build a position for heavy guns and howitzers on railway mountings within a range of a fort or of any target which they may have to confront.

Liaison.—An early experience of the war was the breakdown of the method of co-operation of infantry and artillery which had been taught in peace time. The French were the great exponents of this method. It consisted of liaison par le haut, which means, for instance, that the divisional commander details a groupe of three batteries to support the attack of a brigade of infantry; and liaison par le bas, which means that the infantry brigade and artillery group commanders, and even their subordinates, the battalion and the battery commanders, keep up constant communication during the fight. Under battle conditions, liaison par le bas broke down at once. The British did rather better than the French, because they had five officers per battery as against three, and because they were trained in the use of the concealed artillery position, which necessitates distant communications. During sedentary warfare communication was perfect; every company in the forward trench had a battery to support it, and the battery prided itself on putting over a storm of shrapnel within 10 seconds of receiving the call for assistance. But as soon as the troops left their trenches, in advance or retreat, direct communication between infantry and artillery units ceased altogether. The telephone lines were cut by the enemy's fire; visual signalling were shot down, or, even if they succeeded in finding cover, the smoke and dust soon interrupted their view. Orderlies rarely succeeded in getting through, and the few that escaped being killed or wounded arrived too late for their messages to be of any use. Many devices were tried by the armies engaged; the German system of light signals was the least unsatisfactory. But the direct and intimate cooperation of infantry and artillery units was never realized.
The Barrage.—This breakdown of communications obliged the contending armies to adopt a simpler means of cooperation, and led to the general introduction of the "creeping barrage" (French barrage roulant, German Feuerwalze). Briefly, it is a screen of shells bursting on and close to the ground, which is moved forward across the country by short leaps according to a predetermined time-table. It is "halted" on each successive firing, and continued until informed of the results of it, in order to intensify the effect. It is then moved forward again to screen their further progress, and, when the last objective has been reached, it becomes a "standing" barrage to screen and protect the troops while they "consolidate" the ground which has been gained.

The infantry follow behind the barrage, keeping just clear of the zone of bursting shell. They are screened from aimed fire by the smoke and the dust thrown up, and the barrage is intended to destroy any opposition as it passes on. If it succeeds in doing this, communication between infantry units and the support of artillery becomes superfluous. It has proved practically impossible to control or check the pace of the barrage when it has once started, although the Germans attempted to do so by light signals. This is on account of the difficulty of passing the information from the particular infantry unit which wants a modification of programme to the particular battery or batteries concerned with that part of the barrage, through a "chain of command." For at least one gun per 20 yd. of barrage front is used, and the batteries whose concentrated fire forms the barrage may themselves be widely dispersed.

Such barrages are used to screen retreating troops, though the problem is then more difficult, since the enemy dictates the pace of retirement. Such barrages are therefore made as simple as possible in plan and in execution. Other forms of barrage are used. "Flank" barrages are used to screen the flanks of troops, either halted or in motion. "Standing," as opposed to "creeping," barrages are used for many purposes, such as to prevent the enemy from reinforcing a portion of his line which is being attacked. A form of standing barrage often used for this purpose is the "box" barrage, consisting of one barrage parallel to the front attacked and two at right angles to it, forming three sides of a rectangle. A "preventive" barrage is put down over the enemy's lines when he is supposed to be about to attack. A "counter barrage" is one put down when the enemy is actually attacking, so managed as to take effect on his troops as they follow up their own barrage. In some instances a sham barrage, with no troops behind it, was used to divert attention from the real attack.

Important as the barrage is, it cannot be considered a satisfactory substitute for aimed fire; it is an expedient which has to be resorted to when fire of precision cannot be carried out. Marshal Foch had occasion to warn the French artillery against trusting too much to it. In a circular issued in the summer of 1918, he writes:

"The rolling barrage adopted by the Germans no longer meets the conception of the present war. The artillery cannot pretend to overwhelm the entire terrain of the attack with a rolling barrage, even if redoubled. Its object is not by unloading a brutal fire over a given zone and searching progressively at random with a fire directed straight to its front, without regard as to whether it is followed by the infantry. It is better to attack definite points and intensify the fire in that direction, the counter-battery, or the crushing fire on certain points, reserving a part of the field batteries for accompanying the infantry in intimate cooperation with it."

In other words, it is unsound to abandon at the outset all fire of precision on important targets, and every endeavour to work in cooperation with the infantry, and, instead, to attempt to mow down all opposition with a machine.

Wireless telegraphy may possibly be so developed as to become both directive and selective, so that a hundred stations may talk at once without mutual interference, or risk of being "jammed" by the enemy. Some progress in this direction has already been made. If this or other reliable means of sending and receiving messages becomes a practical fact, it will solve the problem of communication between infantry and artillery, and make mobile barrage of infantry will fall into disuse.

Guns of Accompaniment.—As the creeping barrage advances it is intended to destroy all opposition. But it was found in practice that enemy detachments provided with good cover, such as machine-gun sections with overhead protection, got underground while the barrage was passing over them, and then reappeared, causing very heavy losses to the attacking troops. The French ascribe the majority of their losses in the last phase of the war to this cause. Now it would be extremely dangerous, even if it were possible, to bring the barrage back to "pound" such a danger spot. By the time this had been done, the advancing troops might very possibly have disposed of the machine-guns by bombing, and have resumed their advance, in which case they would come under their own barrage fire. It is manifestly impossible to get the fire of distant guns on to a machine-gun nest in time, though something might be done by an aeroplane dropping a light-ball on it to attract the attention of the guns. The result of the failure of artillery support in this matter has been a general outcry for guns of accompaniment; that is to say light guns, either pack, motor, or hand-drawn, capable of advancing with the infantry, and of dealing with machine-guns or strong points that have survived the barrage, and with tanks.

The matured German opinion is expressed in the following quotation from a document issued scarcely 10 weeks before the Armistice:

"The guns of accompaniment must engage at short range the enemy with whom the infantry is fighting at close quarters. By reason of their proximity to the infantry they can be fired at the right moment, and on the right target more easily than the artillery in rear. Also, being at close range, they can fire on objectives which cannot be observed from the rear."

A light 0-pounder, firing H.E. shell only, to an effective range of about 2,000 yd., is the type of weapon required. The British used their 3.7-in. mountain howitzer, firing a 20-lb. shell, when available; but the ammunition was considered too heavy, and troops who possessed captured German light trench mortars, firing a 14-lb. shell, found this a better weapon for the purpose. The latest type of gun is the U.S. "infantry howitzer," which is carried so far forward as possible by a small cross-country motor vehicle, and thence wheeled or carried by hand. It fires a 6-lb. shell for direct fire, and a 9-lb. shell for high-angle fire.

These guns are required at the rate of about one per 100 yd. of the front of the advance, or from 12 to 16 per division. The French have decided that a gun of accompaniment is to be introduced, and it is understood that it will be motor-drawn or motor-carried, but no further details are available. The Germans, in 1917 and 1918, used a variety of light guns called "infantry guns" in addition to their infantry trench mortars, which were fitted for direct as well as for high-angle fire. But in the great 1918 battles their invariable practice was to detail one, two or more batteries of the divisional field artillery, fully horsed, and with their own ammunition carriages, to support the divisional infantry attack by direct accompaniment (sometimes reinforced). After trying other methods, they finally adopted the practice of allotting sections, even single guns, to the battalions.

These single guns or sections followed up the leading lines of infantry, running up by hand when the horses could not get forward.1

1The relation of the artillery commander to the infantry commander, both being on the spot, was a difficult question which was never definitely solved. In practice, indication of task was as a rule the duty of the infantry commander, and choice of the artillerist and method that of the gunner. But the latter remained free to engage any favourable target without waiting for orders. (C. F. A.)
Gun-Carrying Tanks are here considered as gun-carriers. A war-time tank normally carried two short 6-pounder guns, one on each side, and 200 rounds of ammunition; it could carry another 100 rounds if required. If the tank were made larger, it could carry a 12-pounder or 18-pounder gun inside. When the gun is put outside, on the top, the machine ceases to be a tank and becomes a wheeled automobile gun-carriage or a caterpillar carrier; these have been discussed on pp. 248-49.

The volume of fire from a tank is not sufficient to constitute a decisive factor in the combat. Fire with shrapnel and time fuze from a moving tank would be a waste of ammunition, and the tank would not last long if it stood still. The small H.E. shell is nearly useless against men in the open, and the case-shot which the tank carries is effective only at very short range. The guns of a tank cannot be expected to engage infantry manning a trench parapet, and keep down their fire, except when the tank succeeds in getting astride of the trench and firing down it to right and left. Even then the effect is rather moral than material, since the infantry are protected by the traverses and indentations of the trench, which are specially designed to prevent enfilade. Practically, there are only two things that the guns of a tank can do, but these are both important. They can destroy an enemy tank, and they can put a H.E. shell into a machine-gun emplacement at short range, long before a message could be got through to a field gun a mile behind. For both these purposes the 6-pounder gun is sufficiently powerful, though it is possible that thickly armoured tanks may be built which require a larger weapon to pierce them.

Quite apart from its gun-power, the tank supplements and sometimes replaces artillery fire by its power of crushing obstacles, notably barbed wire and iron palisades.

It remains to be considered whether the tank is a satisfactory substitute for the infantry gun of accompaniment. The advocates of tanks anticipate that in future an infantry attack will be carried out on the following lines:—In front of all is the creeping barrage, closely followed by the infantry and the light tanks ("cruisers") armed with machine-guns and possibly 6-pounders. In desert, where tanks alone are needed, or in victory, tanks and pieces on armoured automobile carriages ("battleships"), and small fast caterpillars ("destroyers") carrying tank-stopping machine-guns. Just before the assault the "cruisers" dash forward in advance of the infantry, supported by the fire of the "battleships" and escorted by the "destroyers." The "battleships" also deal with machine-gun nests and strong points that have escaped the barrage. As the infantry continue their advance, the motor-drawn guns behind, which have been forming the barrage, advance by echelons to fresh positions behind the infantry, and carry the barrage forward.

Supporting an attack on the lines to be had or man-handled on armoured automobile carriages ("battleships"), and small fast caterpillars ("destroyers") carrying tank-stopping machine-guns. battle zone, and to delay an attack long enough to allow the battle zone to be manned.

The field artillery have three sets of positions, known as forward, main, and reserve. The forward positions are in the battle zone, and the guns posted there are intended to protect the outpost zone, and to support minor attacks made from this zone (see p. 253, Warfare between Front Trenches). The main positions are 3,000 to 4,000 yd. behind the front trench, that is, in the reserve zone, some 1,000 yd. behind the second-line trench; the guns posted in the main positions barrage the front trench and support the infantry in the battle zone. The reserve positions are 3,000 to 4,000 yd. behind the second-line trench, and the guns, when they occupy them, barrage the second-line trench and support the infantry in the reserve zone.

Normally about one-third of the field artillery are in forward positions and two-thirds in the main positions. The reserve positions are ready for occupation and supplied with ammunition.

The medium and heavy artillery are behind the field artillery, and the wagon lines are out of field-gun range, that is, at least 5 m. from the enemy's field artillery positions. Additional artillery positions are prepared, so far as the supply of labour permits, for re-inforcing units, which are put in when it is intended to attack, or when an enemy attack is threatened. All guns normally belonging to the front are in emplacements provided with overhanging cover, and carefully camouflaged against the camera. All front trenches and entrenchment posts (called "strong points") are protected by entanglements of barbed wire. Artillery observing posts ("O.P.'s") from which the fire of the batteries is directed, are disposed wherever they can be concealed, and the whole system is connected up by an elaborate network of telephone wires, the main lines being (in British practice) deeply buried.

The arc of fire required of each battery has to be considered when siting and entrenching it. The following is a typical arrangement, subject to considerable local variation. It applies to four infantry brigades of four battalions, three field-gun brigades of four batteries, and one field-howitzer brigade of four guns. Each infantry brigade holds one unit of front, about 1,000 yd., and is supported by one field-gun brigade. Of the four batteries of this brigade, three cover their own unit of front and can cover one more unit on each side, making 3,000 yd. of front; the fourth battery is a "swinger," and covers two units on each side of its own unit, making 5,000 yd. of front. All the field-howitzer batteries are swingers. This arrangement enables the division to turn 15 field batteries on to any point on its own front, and to turn 6 field batteries on to the front of either of the neighbouring divisions when called upon. The medium, heavy, and super-heavy guns and howitzers are all sited, when possible, so as to engage any target within their range.

Under these conditions, as soon as trench warfare began, artillery fire became a matter of very careful preparation and rapid execution. A battery was liable to be called on suddenly to fire on any one of a hundred different targets, visible from an O.P. or not. The first essential was to get every gun to shoot to map range. In open warfare, artillery firing at visible targets neglect the "error of the day" due to variations of temperature, barometric pressure, and wind, since this is corrected by direct observation of fire. In the trenches this error became of great importance; it might, and did, make the difference between hitting the enemy or our own infantry. The daily "Meteor" telegram from the meteorological section of the army corps was supplemented by reference to the thermometer and wind-gauge whenever a battery opened fire. Worn guns were carefully "calibrated" so that their error could be allowed for; this was done at special ranges behind the front, or, when this could not be done, by firing at known points in the enemy's lines. The next matter was to obtain an accurate map, with the positions of the batteries and their targets marked on it, so as to enable the exact map range to be measured.1 The result of this work was a great improvement in shooting, and consequent economy of ammunition. Unfortunately the varieties of powder supplied caused a further complication. It proved impossible to distribute the ammunition so that each brigade had always one particular nature or brand of powder, except on special occasions, when preparations were made for a great attack. It was therefore customary, in trench warfare, to "register" all prospective targets, or at least points near them.

Howitzers.—The necessity for searching deep trenches and other entanglements throughout the front gave rise to a demand for more howitzers. The field gun, firing shrapnel, was invaluable when the enemy moved about their trenches, or showed themselves over their parapets; at other times shrapnel was of little use, except for barrage. The field gun H.E. shell was too small to penetrate parapets, and the field-howitzer shell did not penetrate well-built dugouts. All the belligerents found that the most useful weapon for bombardment was the 6-in. (15 or 15.5 cm.) howitzer, throwing a shell of 100 pounds. The Germans in particular regarded this as their most important weapon for trench warfare. In 1914 the British Army had only a few old-pattern 6-in. siege howitzers, but in 1915 the Q.F. 6-in. howitzer ranging 10,000 yd., which range was afterwards increased to 11,000 yd. by the issue of stream-line shell. By the end of the war the British had 6,437 howitzers in France alone; 3,633 6-in. howitzers had been issued, and 1,458 were in the line in Armistice day, which shows the rate at which they were worn out. They fired over 22,000,000 rounds.

Similarly in 1914 the French had only 300 howitzers of 155 mm., of which 104 were mobile. In 1918 they had 6,000 of this and larger calibres.

The heavy and super-heavy howitzers, 8-in. (21 cm.), 92 or 94-in. (24 cm.) and higher calibres were used for work too heavy for the 6-in.

For all calibres over 6-in., howitzers soon began to supersede guns, though a few flat-trajectory heavy guns were used. The reason for this was a question of supply. A howitzer firing at 45° gets its shell to the target with a much smaller powder charge than a high-velocity gun, and consequently lasts perhaps 10 times as long before it has to be retubed.

Increased Range.—The precision with which "map fire" could be carried out by the methods described above led to head-quarters, wagon lines, ammunition "dumps," and installations behind the lines being shifted to greater distances from the front. This created a demand for increased range. When the Germans initiated the system of covering the front with a zone of "pill-boxes" and small posts, and withdrawing the front trench (or its equivalent chain of short trenches) a mile behind the front of the defended zone, the ranges were still further increased. Even before this, the Germans had lengthened their field gun and brought out a stream-line shell which increased its range from 6,000 yd. to 11,700 yd.; their old field howitzer ranged 7,000 yd., their 1916 pattern 19,000 yd., and similarly with the 6-in. howitzer and larger calibres. Other nations did the same; the French altered the trail of their 75-mm. field gun so as to get more elevation, and increase the range to 13,000 yd. with stream-line shell, and introduced their short 15-cm. gun, converted

---

1 The British, who used 6-gun batteries, used to keep two guns of a battery forward and four in the main position; with 4-gun batteries it is not usually advisable to split them up. The Germans used to keep the whole of their field guns in the main and reserve positions, and these were further back than those described above; guns were sent up to the advanced positions for special tasks only, and were withdrawn as soon as those had been completed.

2 This reserve often showed local landmarks to be 100 or 200 yd. from their positions as marked on the original maps.

3 Registration consisted of firing a series and noting the result; corrected to standard "meet." These series were obtained from O.P.'s when possible, otherwise by aeroplanes or sound-ranging. When an enemy working party was reported by an aeroplane in Trench 50, a battery commander got the order "Target 50 stop 25 shrapnel 25 H.E. Fire." He looked up 66 in his registration book, corrected the recorded elevation, direction, and fuse for "Meteor" and powder in use, gave his orders, and his guns fired the 50 rounds in half a minute. The aeroplane observed the result, which was entered in the registration book for future reference.
to an 8-in. howitzer. In guns designed since the war the increase of range is very marked; thus the United States require 15,000 yd. of range for their new field gun; the latest pattern of British 18-pounder issued during the war ranged 10,500 yd., and the forthcoming pattern will probably range as far as the U.S. gun. Hundred-Mile Guns.—This general description culminated in the German gun or rather guns (colloquially called “Big Berthas”) which shelled Paris from a distance of 76 miles.\(^1\) As early as 1915 the Germans shelled Dunkirk from a point 25 m. distant with a 14-in. naval gun, and they proposed, if they succeeded in driving the Allies back from Calais, to use 110-mile guns which should command the whole of the British coast from Yarmouth to Southampton, and the whole of the London district. Such guns are not specially difficult to make, and both the British and the French artillery authorities had worked out the design of 100-mile guns some years before the war. In principle they depend on firing a shell upwards so as to clear the dense layer of air lying next to the earth, and to attain a height of some 25 m., where the air is so rarefied as to oppose practically no resistance to the flight of the shell. Seven of these guns were used against Paris in 1918, and at the end of the war the Germans had six more building; the British, French, and Italian Governments had each at least one of these guns building, but it is understood that none of these were completed. Owing to the high powder-pressure employed, and consequent high temperature in the bore, the life of the German guns was only about 50 rounds, after which they had to be renewed. For this reason the 100-mile gun marks the limit of practical possibility with propellants now in use. But, if it were considered advisable, it would be possible to make a special powder giving lower temperatures than the gun-cotton and nitro-glycerine powders now in use, and so increase the life of these guns.

**Flashless Powder.**—During “sedentary” warfare, any gun which fired at night within direct view of the enemy was liable to be marked down by the “flash-spotting” section opposite to it, who got cross bearings to it, after which it was soon shelled out. It was therefore necessary to adapt the powder to flashless guns or else to add a portion of special chemical composition to the ordinary charge for all guns which could not be hidden behind woods or hills. The United States have specified that it is to be used in their new field gun.

**Ranging by Aeroplane.**—Apart from the work done by aircraft in locating targets by direct observation or by photography, they were used during trench warfare for ranging on targets which could not be observed from the ground. The aeroplane was from the first fitted with a wireless sending set; but it was only towards the end of the war that practical forms of receiving apparatus were invented, and, generally speaking, messages to the aeroplane had to be sent by code signals, which were strips of white cloth laid out on the ground near the battery. Only simple signals such as “Ready to Fire” could be used; it was therefore necessary to arrange the details as to the target to be observed beforehand. Ranging was carried out deliberately, the aeroplane sending down the result of each shot. Only one such series could be fired at a time on an army corps front, as, with the instruments then in use, if two aeroplanes had been sending wireless at the same moment they would have interfered. With each other. Until the means of wireless communication are improved, aeroplane ranging will remain too slow and elaborate a method for field artillery in mobile warfare, though it may be applied to heavy artillery.

**Sound-Ranging.**—This is described under Rangefinders and Position finders. It consists in measuring the intervals of time at which the sound of an enemy gun successively reaches three or more stations, and, from the differences, calculating the position of the gun. It also enables the point at which one’s own shell bursts to be located. The installation of these stations takes about a day, and in certain conditions the method cannot be depended on or indeed used at all. In mobile warfare, sound-ranging may possibly be used to locate the enemy’s heavy guns.

**Warfare between Front Trenches.**—Simultaneously with the long-distance shooting at targets behind the fronts, constant firing to the instant place between the front trenches, which, early in the war, were in some places only 20 yd. apart. Even when the front trenches were shifted back behind screens of defensive points, constant guerrilla warfare continued to be waged between the detachments opposite each other. The need for trench artillery was soon felt, and was supplied by a new class of weapon. The original trench mortars had only a very short range, and, as they had therefore to be kept close up to the front trench, the loss of life among the detachments was heavy. Later, longer-ranging trench mortars were introduced, which could be posted far back and were available for firing on our own front trench if the enemy broke through.

Trench ordnance on wheeled mounts was used to some extent as accompanying artillery, especially the later pattern of the German light trench mortar, which was fitted for direct as well as for high-angle fire. But the excessive weight of the ammunition renders trench mortars unsuitable as substitutes for guns of accompaniment.

**Wire-Cutting.**—Very early in the war it became necessary to find a means of destroying, or at least cutting lanes in the strong barbed wire entanglements which covered the whole front. At the period of the autumn battles of 1915, this was done on the British front by the sharp-shooters. This was effective for wire-cutting only up to about 1,800 yd.; within that range it was found that lanes could be cut through a belt of wire 8 yd. deep with an expenditure not exceeding 10 rounds per yd. of front. Later on, thick steel barbed wire came into use, which could not be cut by sharpened bullets; moreover, the process of wire-cutting with sharpened required precise and deliberate shooting, and had usually to be carried out on the day before the attack, thus forfeiting the advantage of surprise. However, H.E. shell with ordinary fuses proved useless, as they made craters into which the network of wire fell back, making a worse obstacle than before. In 1916 medium trench-mortar shell with instantaneous fuse came into use; these shell made a crater not more than 6 in. deep, and blew away the wire from a circle about 5 yd. in diameter. But trench mortar ranges are very limited and it was not till the instantaneous fuse was adapted to H.E. shell for field guns and field howitzers that the range at which wire could be cut was increased to 4,000 yards. The French used the 75-mm. field gun, while the British mostly used the 4.5-in. field howitzer. As an alternative method of disarming the trench entanglements or giving a slight delay action was used with H.E. shell for wire-cutting, the object being to burst the shell on the upward branch of its trajectory after impact, within a yard or so of the ground. Some success was attained with this method when the ground was hard and the angle of impact small, so that the shell did not tend to bury itself. Wire-cutting with H.E. shell is a much quicker method than with carefully adjusted shrapnel bursts, provided that a sufficient volume of fire is obtainable (see section Effect Supra). **Counter-Battery work** is the attack of artillery by artillery with the object of destroying the material and inflicting disabling casualties, or at least of neutralizing enemy fire for a certain time. In spite of the results achieved in locating enemy guns by aircraft, flash-spotting, and sound-ranging, counter-battery work throughout the war generally failed to destroy them and their detachments, or even to silence them permanently. However, when a battery was located it was usually possible to neutralize it, that is, to stop or much reduce its fire, so long as fire upon it could be kept up.

If a battery exposed itself in the open within range of artillery in position it was destroyed in a few minutes. Therefore batteries used concealed and camouflaged positions with overhead cover protection against field artillery. If such a position was located the battery was soon shelled out by the 6-in. and heavier howitzers, but it was rarely possible to destroy the guns without an

---

\(^1\) The bombardment of Paris was spread over 140 days: firing took place on 44 days only. 183 8-in. shell fell in Paris, and 120 in the suburbs. The material effect was slight (250 people killed in 41 months) and the moral effect, after the first day, inconceivable.
undue expenditure of ammunition. The usual result was that the gunners retired a few hundred yards (if they had no deep dugouts) till the shellings was over, and then came back to their guns. If they were shelled again they shifted their guns to another position. The ground in front of Vimy Ridge was a mass of positions from which batteries had been shelled out, and it was reckoned that one position in four was occupied. The British and the French used to repair abandoned positions to encourage the enemy to go on shelling them: flashes were fired from dummy positions for the same purpose. "Silent" positions, from which the guns were not allowed to open fire till active operations began, were rarely located.

The Germans were fairly successful in neutralizing batteries with gas shell; concealed artillery positions, being usually in hollows or woods, were specially vulnerable to gas attack. If such a position be thoroughly drenched with persistent gas it becomes untenable, since men cannot work in gas-masks for a prolonged period. In future, flashless powder will make it still more difficult to locate concealed artillery positions.

### III. THE BREAK-THROUGH

During the three years 1915, 1916 and 1917 numerous attempts were made to break through the opposing line, the most notable being the German attack on Verdun. All these attempts failed, the losses being taken merely in the capture of an unimportant strip of ground at a heavy cost. A discussion of the reasons for these failures would be beyond the limits of this article. From an artillery point of view it is more important to consider the method of attack which was finally evolved. The two leading principles are the following:

(a) *Surprise.*—This implies the rapid and perfectly timed concentration of artillery and infantry units in the area of the attack, so that they arrive just when they are wanted. If, as is probable, the result of the attack is that the enemy's line is not broken, but is only bent back, successive surprise attacks are made by shifting the weight of the attack quickly to other points which may be 50 or 100 m. distant, so as to form salients in the enemy's line, which are then "pinched out" by attacking them from both flanks. This, at least, is the obvious course; and, because it is so, it may not be the best one. In some cases a commander may decide that he has a better prospect of surprising the enemy by renewing his attack on the original point. Success depends principally on an organization which enables guns and men in large numbers to be placed in readiness for action in any selected area of attack either without the enemy's knowledge, or so quickly that he has no time for counter-preparation.

(b) *Wide Front.*—It is useless to make a narrow gap in the enemy's line, commanded by his guns from both sides. It must, roughly, be wide enough to allow for 10 m. of shelled ground on each side, and a 20 m. passage down the middle; that is, about 40 miles. The Germans in March 1918 attacked on a 50 m. front.

**Concentration of Artillery.**—The first step is to prepare for the concentration on the front of attack of a sufficient number of guns. Normally the line is held by about one gun to 30 yd., including field, medium and heavy. For an attack, this number must be at least trebled.

The Germans, in their great attack of March 1918 on the 50 m. front from Monchy to Fère, had the following, counting normal establishments only:

*The French had no field howitzers.

The French "Offensive Instructions" of Oct. 31 1917 lay down a scale for the first-class offensive battle of about

1. *Field gun per 15 yd.*
2. *Medium or heavy piece for demolitions per 30 yd.*
3. *Counter-battery per 35 yd.*

Superheavy pieces approximately at 1 per 170 yd. (plus 1 piece of trench ordnance per 30 yd., except in parts of the front reserved for tank action).
ARTILLERY

Regeneration.—The reinforcing guns must be able to open fire at zero hour. Usually the batteries belonging to the front register their targets for them beforehand, the registration being spread over several days so as not to attract special notice. But calibration, study of atmospheric influences, and surveying have latterly been so thoroughly applied that it may be possible, in future, to rely upon opening effective fire by map without ranging. This again requires thorough preparation, which is possible when an attack is planned beforehand. So far as can be foreseen, there is no prospect of dispensing with ranging when the troops are on the move.

Conduct of the Attack. Bombardment.—In the great trench battles of 1916 and 1917 it was customary to begin with a bombardment of the enemy lines lasting a week or even more. This was fatal to surprise action, and in 1918 the preparation consisted of ammunition, and surveying. The results of these efforts have latterly been thoroughly applied that it may be possible, in future, to rely upon opening effective fire by map without ranging. This again requires thorough preparation, which is possible when an attack is planned beforehand. So far as can be foreseen, there is no prospect of dispensing with ranging when the troops are on the move.

A reasonable estimate of the ammunition required for a six hours’ intense bombardment per mile of front seriously attacked is 10,000 rounds field gun ammunition, 10,000 rounds howitzer, 5,000 6-in. howitzer, 2,000 6-in. gun, 500 heavy howitzer, and 200 rounds superheavy howitzer. If the attack presses forward without a check for three days from the start, then at least 50% more will be required on the second day, and the same on the third day if the enemy is reinforced; at any rate it would be unwise to begin an attack without double the above amount in hand. If the attack is seriously checked the intensive bombardment will have to be repeated and a fresh start made. These figures give a fair idea of the scale on which guns and ammunition are used in modern warfare.

The reason for this vast expenditure of ammunition is that the bombardment is not confined to the front of the position attacked—the front zone, as explained above, is a thinly held system of outposts—it is directed mainly on the real defensive zones and centres in rear. Targets such as railway stations, bridges, and road junctions as much as 10 m. behind the front have to be bombarded by the long-range guns and howitzers.

Influence of Tank Action on Bombardment.—In the autumn of 1918 the tanks achieved such success in breaking through defences which had not previously been bombarded that it is considered that in some cases, provided that the ground is favourable for tank action, it may be possible to shorten the preliminary six-hours’ bombardment to half-an-hour, or even to dispense with it altogether, and to trust to the creeping barrage to protect the advancing infantry and tanks (British Field Service Regulations, 1920, Part II., para. 118 [6]). When this method is employed all guns other than those firing the creeping barrage will concentrate on important points behind the enemy’s front simultaneously with the launching of the attack.

This is a new method of procedure, in which our present experience is not enough to enable us to forecast the best course of action with any confidence. The regulation quoted above is cautiously worded, and does not imply that the use of tanks will render bombardment unnecessary. Even if the tanks are expected to succeed in rushing the first and second zones of the enemy’s defences, they will certainly experience increased resistance as they penetrate deeper into the position. In future warfare tanks will not be the only motor vehicles on the battlefield. The mobility of the defender’s motor guns and motor infantry, both on and off the road, will enable him to bring up reinforcements far more quickly than was the case in 1918. Although the attack may be launched without any previous bombardment, it will still be necessary to deliver a heavy fire on targets behind the enemy’s front as soon as the attack is disclosed. It will not be enough to bombard railway stations and road junctions if the defender’s motor troops are independent of railways and roads. Therefore this fire will presumably be no less a bombarding line of fixed points as a line for effect, directed by aeroplane observation, upon the defender’s reinforcements.

So far as can be judged the amount of ammunition required for an attack will be increased rather than diminished, in view of the scattered targets presented by motor troops.

The Infantry Attack.—As soon as the “intense” bombardment has done its work on the outpost zone and the first line the infantry advances, screened by a creeping barrage, preceded by tanks, and closely followed by guns of accomplishment. The bombardment is “lifted” from the first line to reinforce that on the second line; as soon as the infantry have taken the first line fresh waves of men pour through them to attack the second line. When the second line is taken the field artillery of the attack pushes forward by echelons to positions in or near the first line. Later on the medium and heavy artillery push forward.

It is not to be expected that the infantry will be able to advance on a continuous front. After the thinly held outpost system has been rushed progress by is by “infiltration.” Wherever a weak point is found the infantry pour through it, and the advancing streams of men, fed by the local reserves, spread out to right and left and envelop the defensive points that still hold out. Tanks are here invaluable in leading the streams of riflemen, in “rolling out” barriers of barbed wire, and in rushing the centres of defence. It is the involved and complicated nature of this warfare which prevents the main body of the artillery in rear from supporting the infantry in the series of local combats which characterize the advance through the trench system, and which renders it necessary to provide the infantry with guns of accomplishment.

The process of infiltration outlined above is apt to produce irregular salients in the advancing line, which the artillery in rear find it difficult to protect by barrage, and which are therefore the more exposed to counter-attack. On this account it was the practice, at one time, to limit the objective—that is, to fix a line beyond which the troops were not to advance, so that when this line was gained they should present a continuous front, protected by artillery fire, from which a further advance could be made. This system led to a great waste of opportunity. It may still have to be adopted on occasion; but the modern tendency is to gain every possible foot of ground, and to provide reserves on a scale sufficient to “feed” the salients so that they can be enveloped laterally and enveloped by tanks the ground which is still held by the enemy. That is, every salient must become an offensive, not a defensive, feature. Without artillery support these offensive tactics would hardly succeed against the defender’s “strong points,” which are not merely fire-trenches facing the front, but miniature fortresses prepared for all-round fire. It is necessary, therefore, that in addition to the guns of accomplishment part of the artillery in rear should press forward boldly, so as to keep in touch with the infantry and able with the assistance of aeroplanes or of their own reconnoitring patrols to direct a heavy fire on any defensive work which still holds out.

The action of the artillery in the attack may be summed up as follows: the bombardment weakens the defence and the barrage protects the attack. The guns of accomplishment support the attack so long as the enemy continues to retire, offering only slight resistance intended to weaken the attack. When resistance becomes serious the divisional field artillery must be in position and in communication with the infantry, so that

1 The position of one gun in each battery (or other unit) is fixed exactly by survey and marked both on the map and on the ground before the guns arrive.

2 The word “line” is used in this description because no other accepted military term is available. In reality modern defensive systems consist of chains of detached works or trenches, supporting each other by their fire. The only continuous feature which marks a defensive zone is the belt of barbed wire entanglement, and this itself is irregularly traced.
they can support it in local combats. If the resistance becomes obstinate and beyond the power of infantry and field guns to overcome, the bombardment by the heavy artillery must be renewed.

These tactics are repeated as each successive line, or defensive zone, is encountered. The process can be repeated indefinitely so long as the supply of men, guns, and ammunition can be kept up, provided that it is possible to convey them to the fighting line. The latter has proved a very serious difficulty in the past, and has perhaps been more instrumental than any other cause in bringing great attacks to a standstill. It must be overcome by the work of the engineers in repairing roads and railways, and by the provision of improved cross-country vehicles.

**Artillery in Defence.**—Whether defence in the hitherto accepted sense is or is not the form of resistance best suited to modern conditions is a question which lies outside the scope of this article. For the present purpose it is assumed that the ground occupied is to be defended in the literal and tactical sense.

In the ordinary defence of a position the method of meeting an attack varies according to the degree of certainty with which the enemy's intentions have been anticipated, and the amount of preparation which it has been possible to make.

If the attack is expected far enough in advance, and has massed his artillery to meet it, then he can reply to the initial "intense" bombardment with a similar bombardment, which will certainly render the attack ineffective.

If he knows when the attack is to be launched, but has not been able to reinforce his artillery, he can still put down a preventive barrage, just before "zero" hour, on the enemy's lines. This will weaken the attack, and may delay it.

Even if the defender has had no warning, and is unable to oppose gun for gun to the attack, the mobility of motor artillery should, in future, enable him to reinforce his artillery (provided he has been able to get it anywhere) within two days at most. But the enemy will probably provide against this by making a holding attack on a very wide front, or on several fronts. The defender will be uncertain as to which of these is the real attack, and will be afraid to take any guns out of the line. He must then depend upon his general reserve for the artillery reinforcements which he requires.

We will consider the case of a section of an entrenched front, held with the normal proportion of artillery (one gun to 30 yd.), attacked by surprise by a concentrated force (one gun to 10 seconds' notice on the enemy's front line, and bringing it back over one's own lines when necessary, is of course part of the regular routine of trench warfare. But the attacker counts on destroying or neutralizing the guns of the defence by his bombardment and counter-battery fire, and he is likely to succeed to a great extent as regards batteries which have previously disclosed their positions by firing. It is therefore necessary to have "silent" batteries in the line, that is to say, batteries which, ordinarily, are never allowed to fire except on occasions when visibility is bad, and then only under precautions against sound-ranging. The normal expenditure on a divisional front may be 1,000 rounds a day, or less on quiet fronts, and this allowance can be fired by a small number of batteries, so that there is no difficulty, other than the administrative one, in keeping half the guns of a front in silent positions in reserve to repel an attack.

Another necessary precaution is the provision of deeply buried telephone cables, proof against bombardment by heavy artillery; and these must be laid not only to the ordinary gun and observing positions, but also to the positions in rear to which the artillery may have to retire.

As soon as the attacker begins his "intense" bombardment the guns of the defence reply with a similar bombardment, necessarily on a scale corresponding to their smaller number.

"Silent" batteries take part in this, since the smoke of the bombardment will conceal their positions. When the infantry attack is launched, then, assuming that the defender has still a fair number of batteries effective, as soon as the call is made upon them the field guns and trench mortars of the defence put down a heavy barrage on the enemy's front-line and communication trenches. Medium guns and field howitzers barrage probable assembly points, while medium and heavy howitzers bombard the attacker's gun positions, so far as these have previously been disclosed. Since the defence has been weakened by the bombardment it is probable that the attacker will capture the forward zone. It takes one gun per 20 yd. to make a heavy barrage; the defender starts with only one gun per 30 yd., and may be reduced to one gun per 60 yd. at the end of the "main" bombardment. Of these at least a third will be firing on the attacker's guns and communications, so that the defender's barrage will presumably be too thin to stop a determined attack, though it will cause a considerable number of casualties.

For this reason the defender will probably elect to use a partial barrage, that is to say, a barrage of effective density, covering only part of his front, the remainder being protected by machine-guns and trench mortars. If his telephone communications are thoroughly reliable he may be able to control this barrage so as to put it down, at a moment's notice, in front of any part of the line that has been attacked. If this is not possible, he may have to use alternative sets of barrage orders, so that the whole barrage can be put down on any one of three sections of the front. But this method is so complicated and so liable to break down that few commanders would care to trust it to.

As the attack gains ground the defender endeavours to keep his counter-barrage on the leading troops of the attack, and behind his retiring infantry; but owing to the inevitable breakdown of communications while the infantry are on the move it is not likely that this ideal will be completely achieved. When the defenders retire the second zone of defence the attack will be getting within rifle range of the defender's field guns. The defender cannot afford to lose the whole of his field guns, but it is desirable that some of them, say one-third, should remain in action till the enemy is within 500 yd. of them, as they will cause heavy loss by their point-blank fire. If well supported by the guns which have already retired they have an excellent chance of getting away. As the retirement continues the medium and heavy pieces have to withdraw to the positions prepared for them in rear.

There are many details, such as the support of local counter-attacks and the infliction of "strong points" which have held out against the attack, which cannot be entered upon here. Speaking generally, the object of the defender when attacked by a greatly superior force is to maintain an orderly retirement, with his line bending back but never breaking, taking heavy toll of the attacking infantry at every stage of their advance, until the attack is sufficiently weakened, or the defender sufficiently reinforced, to enable the defender to launch a general counter-attack.

**Enfilade Fire.**—It has often been suggested that the best artillery defence is that afforded by the oblique and enfilade fire of guns from adjoining sectors of the front. This theory broke down in practice. During sedentary warfare every division had enfilade sections established in its neighbours' territory, or else had a "call" on some of its neighbours' guns for enfilade purposes. So long as the line was not seriously bombarded these guns were very useful. But when the line was attacked in force it was quite hard enough to keep up communication from front to rear within a divisional area, and it proved impossible to direct the fire of the guns of other divisions. These often joined in on their own account to help a neighbour when they could, but what was going on in their own sector their assistance could not be relied on as part of the scheme of defence.

Within the divisional front the method of enfilade fire at short ranges is constantly employed; every one of the detached trench lines and other works which constitute a defensive zone should be enfiladed from works in rear of it, and the approaches to it should be swept by oblique fire. This duty is chiefly performed by machine-guns, but it is advisable, when possible, to provide the batteries in rear with cross-countryemplacements from which guns can fire obliquely or even across their front.
Artillery

Defence against Tanks.—In describing the defence of an entrenched position, no mention has so far been made of tanks, although the use of these is now one of the most important features of the attack. And this is because the best method of dealing with attacking tanks is still a matter of speculation.

Tanks advancing against a position are screened from the aimed fire of distant artillery by the barrage which precedes them. If ordinary field guns are concealed in the front line to destroy them, these are generally destroyed themselves by the bombardment. Some tanks may be hit by the defender's barrage, but this is likely to be either thin or partial. At a later stage some of the tanks will be hit by those field guns which remain behind until the attacking infantry are within 500 yd. of them. The uncertainty of defence by mines and by ditches has been shown by experience. Tank-stopping rifles and tank-stopping machine-guns are effective against the present tanks, but those used in the next war will be proof against anything short of a gun.

It is often assumed that attacking tanks will be engaged by the tanks of the defence. But when a position is subjected to a fully organized attack the latter will not find it easy to do this. If kept well up to the front in readiness they will be destroyed by the bombardment, to which they offer large targets. If kept some 3 m. in rear till the attacking tanks appear, they will, even if their movements be correctly timed, have to pass through the attacker's bombardment and barrage, and possibly through their own barrage. Moreover, the tanks of the defence are presumably fewer in number than those assembled for the attack, so that even if they arrive in time they will be out-matched.

The best solution of the difficulty would appear to be the provision of special anti-tank guns, large enough to put an armour-piercing shell into a tank, and small enough to be provided with strong cover. A light mountain gun, capable of being divided into man-loads, would be suitable for the purpose. These guns might be in dugouts some 400 yd. behind the front line, where they would not be subjected to the full violence of the bombardment. When this was lifted from the front line preparatory to the assault, the anti-tank guns would be put together and run up on to platforms level with the tops of the trench parapets, giving them sufficient command to see the attacking tanks as they charged the front line.

A regular defence in depth by anti-tank guns would have to be provided for, additional anti-tank guns being sited behind each successive line of defence, as well as in "strong points." These anti-tank guns would have to be "silent" guns, at least so far as their own firing emplacements were concerned. Their provision, on a scale sufficient to stop a tank attack, would involve a considerable addition to the artillery of the defence. For even if the infantry guns of accomplishment were utilized as anti-tank guns, there would not be enough of them. Infantry guns are required at the rate of one per 100 yd. of the front of the attack, or at most 16 to a division; while if a division holds 3,000 yd. of entrenched front it will require three lines of anti-tank guns sited 100 yd. apart, that is 15 in each line, or 45, besides some 15 for "strong points." This calculation shows that 60 anti-tank guns per divisional front are required, or about one per 45-50 yards.

It may be suggested that the anti-tank guns of the first line could withdraw to the second line, and then again to the third line. But since they have to remain in position till the attacking infantry have almost reached them, in order to deal with the tanks, there would appear to be little chance of withdrawing the guns, although the detachments may be able to escape.

The expenditure of men and material for a special purpose which the above scheme involves is not to be undertaken lightly. But it has become manifest that attacking tanks are safe from distant artillery, and must be engaged by guns on the spot. Therefore these guns will have to be provided; and, so far as our present experience extends, the provision of numerous small guns in the trench area seems to be the best answer to the menace of the tank attack.

IV. The Phase of Exploitation

In France, in the latter half of 1918, after four years of trench fighting, the retreat of the invader brought the combatants into the open once more, but under changed conditions. The artillery had increased in numbers relatively to the infantry; their ammunition supply admitted of a greatly increased volume of fire, and their range had been extended. Mechanical traction, even for field artillery, had to a great extent come into use, especially in the French army, and medium, heavy and even superheavy ordnance were able to accompany the troops in the field.

Under such conditions the troops had to adapt themselves to a new method of warfare. The pre-war battery commanders, experts in mobile warfare, had been replaced by others whose training had begun in the trenches. Few of the officers and men had any knowledge of mobile warfare as thought and practised before the war, and even these found that they had to learn their work afresh.

Moreover, owing to the strain upon the munition factories manufacture had come to be limited to projectiles of simple design suited for mass production, and shrapnel had disappeared from all but the field-gun equipments. In the French army, even these had only 5% of shrapnel, the rest being H. E. shell.

The mobile phase did not last long enough for the employment of artillery in a war of masses to be thoroughly studied. The conclusions arrived at cannot be regarded as final, and are subject to possible modifications due to the more extensive use of machine guns and motor infantry.

Horse Artillery.—The old methods of manoeuvre are not applicable to a war in which the line of battle is continuous, with no flanks. Whatever the general procedure selected by the attacker, or pursuer, he will keep close touch with the defender's line, and maintain pressure on it at all points so as to deny him freedom of manoeuvre. The object of the pursued is to break away from the pursuer, and to lose touch with his troops, so as to regain freedom of manoeuvre in order to counter-attack, to take up a defensive position, or both. In this nature of warfare horse artillery are of great value. (In the coming age of motor artillery, the term "horse artillery" must be understood to mean a more mobile arm than the divisional field artillery, capable of working with the "cavalry" of the future, however that arm may be transported.) The lessons of the first phase of the western campaigns and of the Palestine campaign of 1918 still hold good.

The Attack.—The result of the continuous line of battle is that all attacks are, tactically, frontal attacks. Within the limits of an army corps or divisional frontal attack there will be local flank attacks; thus it is often easier to envelop a strongly held locality than to take it by direct assault. But these are minor operations which concern the trench mortars, the guns of accomplishment, and the gun-carrying tanks rather than the main body of the artillery.

Intimate co-operation of gun and rifle is more necessary than ever, owing to the increased fire-power of the defence afforded by the machine-gun. The breakdown of liaison par le bas in the opening phase of the war has already been referred to; in the concluding phase this was still more marked, and the French especially complained that their artillery misused the increased range of their field gun by keeping far in rear of the infantry, where communication with them was impossible, instead of pressing forward to find out what was going on. But even if liaison is so far effective that the artillery know when the infantry is checked by fire, it does not follow that they will be able to discover the source of the fire. Possibly the infantry may not know themselves. Aeroplanes may be of great help both in locating it and in promptly conveying the information to the supporting artillery. It is even conceivable that battery commanders will direct the fire of their guns from aeroplanes. But the possibilities of "liaison by the air" are still too vague to count upon.

The Barrage.—Since, under present conditions, the artillery cannot always give the infantry direct support by killing the
troops that are firing on them, it is the more necessary that they should at least screen them from aimed fire. Therefore, the artillery barrage has become a feature of mobile as well as of trench warfare. Tanks also require to be screened by a barrage, although this, since it is not required to destroy opposition, may consist of smoke shell, of which a relatively smaller number suffice to create an opaquely veiled. Therefore, in a future attack, the artillery must be on hand so that they can be got into action at short notice, ready to form a barrage at once. But the artillery of the normal divisional establishment will barely suffice for the purpose. If it is a smoke barrage that is required, this is preferably fired by the divisional field howitzers which are the most suitable weapons. These are provided as a rule on the scale of about 16 pieces per division. If, then, the division attacks on the right hand, this gives one field howitzer per 100 yd., and at their highest rate of fire (about 10 rounds a minute for short periods, or 100 rounds an hour) they will not be able to form a smoke barrage to cover the whole divisional front, unless the weather conditions be exceptionally favourable. Similarly, for an offensive barrage of shrapnel or H.E., which requires one gun per 20 yd., the 72 field guns and field howitzers of a pre-war division would barely suffice to cover its attacking front, leaving none available for bombardment and counter-battery work. The divisional artillery must therefore be reinforced for an attack, as in trench warfare, though not necessarily to the same extent.

This reenforcing artillery will be taken, in the first place, from reserve formations. Presumably the highly mobile army reserve field artillery will be drawn upon first, and then the artillery of the divisions in reserve. It may even be necessary to take field artillery from other divisions in the fighting line. In the days of horse-drawn artillery this would have been a dangerous expedient, but with motor artillery capable of covering 30 m. a day the objections are less serious.

Observation of Fire.—When both forces are on the move, there can have been no previous registration of targets. Therefore the medium and heavy artillery which engage upon smoke targets, must use aeroplane observation so far as available. Firing by the map in is mobile warfare a last resource, as there is no opportunity for the survey work characteristic of trench warfare and of the preparatory phase of the break-through battle. The mastery of the air, in order to enable ranging aeroplanes to do their work, is of the highest importance.

Change to Trench Warfare.—Mobile warfare is liable to turn into trench warfare at any moment; the retreating force, if not vigorously pressed, may have time to entrench a position. And even the advancing force may find it expedient to halt and entrench itself by entrenchments when the strategic centre of gravity shifts to another part of the line or even another theatre of war. Therefore an advancing or retreating force must have at hand, so as to be available at short notice, the whole armament necessary for trench warfare, from heavy howitzers on railway mountings down to trench mortars.

The Defence.—A defensive position in mobile warfare differs from a regularly entrenched position principally by the weakness of its passive defences. Belts of barbed wire, deep trenches and ditches, and armoured machine-gun emplacements cannot be improvised; they require time, labour, and material. As regards offensive power, the chief drawback of an improvised position is its weakness in long-range artillery fire, due to the fact that firing by the map requires careful preparation, including surveying and marking from aeroplane photographs. Another weak point is the difficulty of providing reliable communications, since deeply laid telephone cables are not available. As above mentioned, the position consists of a system or network of localities, supporting each other by their fire, and distributed in depth as far as the strength of the force allows; thus a strong force may hold a zone 3 m. deep, with the positions nearest the enemy held just strongly enough to oblige him to deploy. A few horse artillery or mountain guns, supported by machine-guns, afford a sufficient volume of fire for this purpose. As the attacker penetrates into this network of small positions, he finds it increasingly difficult to maintain a continuous line, with or without a barrage in front of it, and he is exposed to counter-attacks, especially from tanks which have been detached. The machine-guns, which are capable of being supplied in a shape in which they are not exposed to their full capacity; better value, gun for gun, is obtained from the four-gun battery. In Great Britain, on the outbreak of war, all the batteries of the new army were raised as four-gun batteries, as were already those of the Territorial Force. Even the British army reverted to the six-gun organization; the reason given being the impossibility of providing a full battery cadre of five officers for every four guns. But it is an open question whether that cadre as conceived in Great Britain is not itself unnecessarily large. The French have only three,

The Italians were about to introduce the four-gun battery in proportion as the Depot gun replaced the Krupp.

V. Organization

Before the World War the artillery of the military Powers was organized on the following general lines: Cavalry division, one horse artillery battery per brigade of three regiments, each of 600 sabres. Infantry division of 12 battalions, six field guns (including field howitzers) per battalion of 1,000 men. The British division had also one battery of medium guns. Army Corps of two or more divisions, 6-in. guns and howitzers (no fixed scale), and the divisional artilleries. In the French army, a proportion of the field guns which elsewhere were assigned entirely to divisional artilleries was reserved under corps control as "corps artillery." Army of two or more army corps, all mobile guns and howitzers of calibres above 6-in. (few existed) and a siege train when required.

Proportion of Guns to Rifles.—The proportion of six field guns per 1,000 men is retained as a normal scale, but extra field guns from army reserve had to be added for anything larger than an army corps operation. Opinions differ as to the strength at which this reserve should be maintained; it may possibly be fixed at 25% of the divisional artillery.

For trench warfare, the divisional field artillery had to be supplemented by the addition of pieces effective against field entrenchments. These included medium howitzers, notably the 6-in. howitzer throwing a 100-lb. shell, and medium and heavy trench mortars.

Battery Organization.—Before 1914, field artillery had in most cases been organized in batteries of four guns. Great Britain (for her regular army), Germany, Austria-Hungary and Italy, however, kept to the old six-gun battery. The Russians had a unit of eight guns, which could be used as two four-gun batteries. The four-gun battery is tactically more efficient; it admits of more intensive fire-direction, and is easier to lead and to conceal. Moreover, a six-gun battery rarely has occasion to use its full fire-power of 20 rounds per gun per minute, and its guns are not exposed to their full capacity; better value, gun for gun, is obtained from the four-gun unit. In Great Britain, on the outbreak of war, all the batteries of the new armv were raised as four-gun batteries, as were already those of the Territorial Force. Even the British army reverted to the six-gun organization; the reason given being the impossibility of providing a full battery cadre of five officers for every four guns. But it is an open question whether that cadre as conceived in Great Britain is not itself unnecessarily large. The French have only three,
and in their batteries many of the duties which the British consider can only be done by an officer are performed by warrant or non-commissioned officers. The six-gun battery in peace, on the other hand, makes for economy and it is doubtless on this ground that the British authorities have decided, since the war, to retain it for field batteries.

**Distribution of Field Guns and Field Howitzers.**—In most armies, the field artillery is divided into a number of divisions, 

259 system of all slow-moving

113 different allotted wagons, armies and field howitzers. It is a question whether the howitzers should be organized as a separate brigade, or whether each brigade should consist of three batteries of guns and one of howitzers. [It was explained that the use of the term "brigade" to mean a group of three or four batteries of artillery is peculiar to the British army. Other nations restrict this term to the higher formations, commanded by a general officer, the unit corresponding to the British "brigade" being designated *groupe*, battalion, *Artillerie*, division, etc.]

The Germans, in 1915, distributed their howitzer batteries among the gun brigades, but later on, they re-arranged separate howitzer, brigades in the proportion of two gun and one howitzer brigade per division, the three batteries of each being all on the four-gun basis. The British broke up their howitzer brigades and distributed the batteries in 1916, and retained these arrangements.

The German army corps of two divisions possessed 144 field guns and field howitzers, and 16 heavy field (6-in.) howitzers. Only the latter named were corps troops, all field artillery being divisional. Each division frequently had one howitzer battery, each regiment having two *Abteilungen* of six-gun batteries each. Each of the four *Abteilungen* in each division was armed with 105-mm. (4.1-in.) field howitzers, the other three with the 77-mm. field gun. The corps heavy artillery formed a "battalion" of 4 field guns of the war. The difference in the training of the men is slight, and is concerned principally with the extra complication of the divisible charge used in howitzers. Now that it is proposed in most armies to use a single charge with as normal as possible for long guns also, this difference is tending to disappear. During trench warfare, a howitzer brigade was never used as a fire-unit; its batteries were distributed among the field batteries of the divisional mobile warfare organization. There are many occasions when the fire of field guns requires to be supplemented by that of field howitzers, and few, if any, when a field howitzer brigade would be used alone. Assuming that the field howitzer is the equivalent of the field gun, as the former appears to be the mixed gun and howitzer brigade, consisting of three batteries of guns and one of howitzers, is the better organization of the two.

**Field Artillery Organization of Artillery during the War Period.**—For the standards of 1914, three types may be taken as representative: the German, the French and the British. Field and heavy field batteries will be considered separately.

The German army corps of two divisions possessed 144 field guns and field howitzers, and 16 heavy field (6-in.) howitzers. Only the latter named were corps troops, all field artillery being divisional. Each division frequently had one howitzer battery, each regiment having two *Abteilungen* of six-gun batteries each. Each of the four *Abteilungen* in each division was armed with 105-mm. (4.1-in.) field howitzers, the other three with the 77-mm. field gun. The corps heavy artillery formed a "battalion" of 4 field guns of the war. In trench warfare, a howitzer brigade was never used as a fire-unit; its batteries were distributed among the field batteries of the divisional mobile warfare organization. There are many occasions when the fire of field guns requires to be supplemented by that of field howitzers, and few, if any, when a field howitzer brigade would be used alone. Assuming that the field howitzer is the equivalent of the field gun, as the former appears to be the mixed gun and howitzer brigade, consisting of three batteries of guns and one of howitzers, is the better organization of the two.

The German army corps of two divisions possessed 144 field guns and field howitzers, and 16 heavy field (6-in.) howitzers. Only the latter named were corps troops, all field artillery being divisional. Each division frequently had one howitzer battery, each regiment having two *Abteilungen* of six-gun batteries each. Each of the four *Abteilungen* in each division was armed with 105-mm. (4.1-in.) field howitzers, the other three with the 77-mm. field gun. The corps heavy artillery formed a "battalion" of 4 field guns of the war. In trench warfare, a howitzer brigade was never used as a fire-unit; its batteries were distributed among the field batteries of the divisional mobile warfare organization. There are many occasions when the fire of field guns requires to be supplemented by that of field howitzers, and few, if any, when a field howitzer brigade would be used alone. Assuming that the field howitzer is the equivalent of the field gun, as the former appears to be the mixed gun and howitzer brigade, consisting of three batteries of guns and one of howitzers, is the better organization of the two.

The French artillery was divided into divisional and corps artillery, armed uniformly with the 75-mm. gun. The few field batteries available were army artillery and there was no light howitzer. The field battery had four guns and no less than 12 ammunitions wagons, with six other vehicles. The personnel was three officers and 170 men. The field battery consisted of 17 field guns, six with a total of 544 men (including 16 officers), 514 horses and 71 vehicles. The first ammunitions reserve was an artillery ammunitions section of 20 ammunitions wagons (half slow-moving) and other vehicles. Each division had a regiment of artillery consisting of three *groupes* and each corps, as artillery regiment, a regiment of four *groupes*; there were thus 10 *groupes* or 30 batteries (120 guns) per corps.

The British army in 1914 did not possess the corps organization, and some elements usually under corps control were in this instance divisional, especially the heavy field artillery.

The French heavy artillery under the command of a brigadier-general and consisted of three "brigades" (of three six-gun batteries each) of 18-pr. guns, and one brigade (similarly constituted) of 4 1/2-in. guns, plus one four-gun battery of 60-hp. heavy field guns. The battery had 192 horses per gun, making a total of 20. The battery personnel numbered 200 including 5 officers, with 174 horses. To each brigade was attached permanently a light ammunition column, consisting of a third ammunitions wagon per gun, and 13 vehicles of different sorts for infantry ammunition. In all, the brigade with its ammunition column had 9 officers and men, 764 horses and 102 vehicles. The organization of the howitzer brigade was practically identical, except that its ammunition column did not supply infantry, so that the total of vehicles was smaller, viz., 79. The strength in personnel was 763 and in horses 719. The heavy battery had 19 vehicles including its guns, and possessed an ammunition column of its own, consisting of a third ammunition wagon for each gun and one other vehicle. Thus in all, the battery had 24 vehicles. The personnel of battery and column together was six officers and 192 other ranks with 144 horses. The divisional ammunition column consisted of 113 general service wagons (of which 91 were for artillery ammunition, 18 for infantry and 4 for special stores), personnel 45 officers, 553 other ranks, horses 709.

A general comparison of artillery strengths in men, horses and vehicles (excluding those allocated to the service of infantry ammunition) shows the following:

(In all the above figures, supply and baggage wagons have been included.)

This organization, designed for mobile warfare, broke down under trench warfare conditions. The organic artillery allotment of the division proved to be too large for normal trench warfare fighting and too small for battle. The army corps itself, as a standard unit, gradually ceased to exist, and was changed into a new form of army corps which—generally fixed in a particular area of the front—constituted a permanent framework, in and out of which different divisions constantly passed from "line" to "rest" and vice vers." The exhaustion of the fighting energy of infantry and of artillery respectively when in the line proceeded at different rates, and the infantry of a division frequently had to be withdrawn and replaced by that of another while its artillery remained in position. The growth of the "dump" system of ammunition supply rendered the elaborate organization of horsed ammunition reserves largely uneconomical. Lastly, the range of guns permitting of artillery collaboration between adjacent divisional sectors—especially for counter-battery work—a common organization for the command of the artillery of several sectors was bound to come into being.

In the British, French and German artillery, accordingly, the divisional field artillery was reduced to a strength suited for a divisional sector in trench warfare; this artillery went in and out of line with its division. The remainder of the field artillery was formed into a mass of "army reserve artillery," the function of which was to double, triple or quadruple the divisional artillery in a battle area. This reserve, being wholly independent both of the area organization and of the divisional formation, could be brought into action as required and for as long as required. The medium and heavy artillery, similarly, was divided into two portions, but the change was here less obvious, as little or no artillery of these classes had belonged organically to divisions. The one portion was substantially fixed to the area, the other placed in an army reserve and used to reinforce the area heavy artillery for battle periods.

The following diagram illustrates the evolution just described:

* Neither the French nor the German first reserve columns supplied infantry ammunition.
The effective solution that this reorganization provided for the problem of divisional reliefs, and incidentally the necessity for some such solution, are illustrated by the fact that in the pro-

longed Flanders battle of July–Oct. 1917, the average time spent in line by divisional artillery (which moved in and out with their infantry) was 33 days, while the average for units of the army reserve field artillery was 72 days.

When fully developed—at the end of 1917—the higher organization of the British artillery in France was as follows:

Army H.Q. and General Officer commanding Artillery in the Army.

<table>

(Thick lines show organic system, thin lines special battle system)

At this period the field brigades were composed of three guns and one howitzer battery each; the composition of heavy brigades varied considerably, a "mobile" brigade consisting of two 60-pr. and two 6-in. howitzer batteries, while others contained 9.2 and 8-in. howitzers in addition.

German practice differed considerably from this, in that all artillery in a divisional area was under control of the divisional artillery commander, while in major operations the artillery of several corps together was controlled for the occasion by a "general of the artillery" who was often neither a general officer in rank, nor a permanent member of the army headquarters concerned.

The average strength in batteries of a divisional sector (in the case of the German nine-battalion division) was—the six field-guns and three field-howitzer batteries of the division, and five to seven batteries of medium and heavy artillery belonging to the sector, or, in pieces, 36 light plus 24 heavy (irrespective of trench mortars). Figures have already been given for typical artillery strength in battle (in terms of yards of front per gun).

The return to open warfare conditions in 1918 made further changes, chiefly in the direction of providing divisions with medium artillery of their own and separating what had formerly been "sector" heavy artillery into calibres suitable for incorporation in mobile divisions and calibres best managed by corps headquarters. The Germans made a beginning with this process in permanently allocating a group of one 10-cm. gun battery and two 15-cm. howitzer batteries to each divisional artillery.1 But the best example of artillery organization as conceived in 1918 for purposes of the expected mobile warfare, is that laid down (though never fully carried out owing to the close of hostilities) for the American Expeditionary Force.2

The divisional artillery consisted of a brigade of three regiments, two being of field guns (75 mm.) and one of medium howitzers (155 mm.). The field-gun regiments consisted each of two "battalions," and each "battalion" of three four-gun batteries, in all 24 guns per regiment or 48 per division. The other had three "battalions" each of two four-gun batteries, making 24 medium howitzers. Thus, as in 1914, we find 72 guns per 12 battalions or six guns per 1,000 rifles, but the addition of numerous heavy machine guns to the rifle strength makes the proportion of guns, in relation to fighting frontage, somewhat less. Each divisional artillery possessed a battery of 12 medium trench mortars.

The corps artillery (each corps had four divisions) comprised one regiment of medium guns (4.7 in.) and one of heavy guns (155 mm.) both "motorized," as well as four batteries of heavy trench mortars. These artillery regiments were arranged, like the regiments of a division, in three battalions each of two four-gun batteries; thus in all, the corps artillery contained 24 medium and 24 heavy long guns. The two regiments formed a brigade.

Army reserve artillery (for an army of five corps or 20 divisions) consisted of four brigades (motorized) or 12 regiments of heavy guns (6-in.), organized as above, and containing in all 288 pieces, and five regiments of field artillery (organized in the same way as divisional field artillery regiments) with 100 pieces.

Lastly, under G.H.Q. direct was the Railway Artillery Reserve, consisting of 42 batteries (i.e. pieces) grouped in "battalions," regiments and brigades.

Neglecting the last item, then, we find for an army of 20 divisions, to be engaged in offensive mobile warfare and counting 209 battalions of infantry and pioneers and 120 regimental and divisional machine-gun companies:

<table>

</tr>
<tr>
<td>= 1,140 pieces</td>
<td>= 480 pieces</td>
<td>= 480 pieces</td>
<td>= 768 pieces</td>
</tr>
</tbody>
</table>

Total batteries 702; total pieces (excluding Railway Artillery and trench mortars) 3,168; or roughly 10 guns per 1,000 of infantry, pioneer, and machine-gun establishments, of which 43 belong to divisional, 3 to corps and 21 to reserve artillery.

In the British and American examples quoted, an artillery staff under a brig.-gen. or maj.-gen. is provided at the rate of about one per 90 guns (or including the field artillery pool one per 100). The German artillery staffs were in a smaller proportion. This question of higher artillery commands is still an open one, but it is clear that under modern conditions no reversion is possible to the simple method of 1914, in which there was no effective artillery staff at a higher level than the division. War organization will necessarily include some proportion of these higher artillery commands, and peace organization must provide, if not these executive posts themselves, at any rate the means of preparing the officers who may be called upon to hold them.
Ammunition Supply.—Before the war all armies were equipped with mobile ammunition columns, which served the needs both of infantry and machine-guns and of the artillery itself. As a rule certain columns in each formation were supplied with limbered vehicles and field artillery horses, and were as mobile as the batteries, while the remainder, with vehicles of the ordinary army type, possessed the mobility of baggage columns only. In Great Britain a considerable advance toward simplifying the ammunition supply service had been made by introducing lorry transport, worked on the same system as that which provided the army’s daily bread, and by attaching a light ammunition column permanently to every brigade of field artillery. And all supplies at the front were based on a system of “dumps,” the mobile reserve of ammunition constituted by these brigade ammunition columns was not required. They were therefore put back into the “divisional” ammunition column, or second echelon of supply, which itself was recast on a much smaller scale. In the more open warfare of 1918, however, it was found necessary to return a portion of them to divisional control.

The batteries themselves retained, and necessarily so, all their original wagons.

The organization, and nature of transport, required for reserve ammunition in the future depends principally on the organization and motive power of the batteries. But it may be assumed with some confidence that since mechanical transport improves every year in available numbers, trustworthiness in different conditions, and freedom of movement, harnessed ammunition columns are a thing of the past. Even theatres of war for which mechanical transport is unsuitable to-day will be open to it to-morrow.

Organisation of Artillery Motors.—During the war the personnel in charge of the artillery motor lorries, tractors, and other motor vehicles were not artillerymen, but were taken from the transport services. This was only a provisional arrangement, due to the fact that the artillerymen were not competent to take charge of motor vehicles. As the motor replaces the artillery horse, this incongruity will naturally disappear, and the artillery will drive their own motors. This will presumably not apply to lorries used to transport guns behind the fighting line, as described above, since these lorries will be general transport, available for other troops when not employed with the artillery.

The leading principle is that all men who go into action with the guns, or who are available to replace casualties in the fighting line, must be artillerymen.

Special Artillery and Scientific Auxiliaries.—The introduction of guns of accompaniment, to advance with the front line of the infantry, is contemplated in all armies. The question arises whether these guns are to belong to the infantry, like their own machine-guns, or to the artillery. It is urged on the one hand that the special knowledge required to use a field gun is such as the infantry cannot be expected to attain. On the other hand, infantry officers point out that the gun is not required for general artillery purposes, but merely as a large-bore machine-gun, and that the detachment must be thoroughly familiar with infantry work. The question is, therefore, as to the extent to which the guns of accompaniment are to be used as batteries or as single guns. In the latter case, they should be infantry, not artillery, weapons.

A more difficult question is whether tanks armed with guns are to belong to the artillery or to a separate tank corps. It is easy to draw the line between a fighting tank which has a gun as part of its armament, and a tractor which pulls a gun into action and then waits behind like a limber and team. These are the two extremes, but there are intermediate forms, such as the tank which carries a gun on a platform, capable of firing either on top of the tank or on the ground, and the tank which is an integral part of the gun-mounting, and is technically an automobile gun-carriage. It seems probable that all these types

1 In the new organization, that part of the divisional ammunition column which carried the second reserve of gun ammunition was reduced to one-seventh of its former size.

ARTILLERY

VI. The Effect of Artillery Projectiles

It is of great importance to the soldier to know the probable effect of artillery projectiles. On the one hand, the artillery commander must know what nature of projectile to use for a given task, and how long it will take to be fired, and, on the other, the troops must know what measure to adopt in order to escape the shell-effect, or to minimize it.

The projectiles fired by land artillery are shrapnel shell, H.E. shell, and chemical, incendiary and illuminating shell. They may also have to fire armour-piercing shell at armoured forts and at tanks, though these shell are not part of their usual equipment.

Shrapnel Shell.—This is the most efficient man-killing projectile against trench or open enemy when manning a parapet. The French calculate that in 1914, when their artillery fired 1,000,000 shrapnel, they killed five men of the enemy for every ton of ammunition expended, whereas in 1918, when, after a long period of trench warfare, the proportion was 40% of 95% of H.E. shell, they killed only one man per 4 tons of ammunition. The reduction in the proportion of shrapnel carried was due to the difficulty and expense of supply, especially as regards the fuse. The effect of the shrapnel will have to depend on the ammunition, and of the gunner who uses them, to obtain a dense shower of bullets flying forward close to the ground.

With a view to shrapnel effect, the gun-designer produces a gun with high velocity, long range, and flat trajectory. But a gun equipment of given weight can produce only a given amount of shell energy, which is measured by the product of the weight of the shell and its speed. The proportion of these two factors of the energy of shell depends upon the number of shells. The shrapnel gun must therefore fix a compromise between a heavy shrapnel and a light high-velocity one. This has been solved differently by different nations, as follows:

<table>

The Russian and French guns are best adapted for shrapnel fire. The German use a heavy horse-drawn shell which is the same as the trajectory gun, gives a deep zone of shrapnel effect, suited to their bold method of opening fire, which is intended to produce a crushing effect on the enemy with the least possible delay. The Germans were obliged by the low power and curved trajectory of their field gun, in which muzzle energy was subordinated to mobility, to abandon the idea of a far-reaching shrapnel and to accept the necessity of employing more rounds for searching a given depth.

Another consideration affecting the question of high velocity versus heavy shell is that the light shell loses its high remaining velocity, which gives the forward impulse to the bullets, much sooner than the heavy shell, so that much of the power of the gun is wasted on overcoming air-resistance, instead of being communicated to the bullets. However, it maintains the initial advantage due to a low angle of elevation up to extreme shrapnel range. The loss of remaining velocity can be partly compensated for by increasing the driving charge in the shell. The shrapnel then acts as a short gun fired close to the enemy. But although this expedient is adopted to some extent in most equipments the limit of efficiency is soon reached, since the large charge reduces the bullet capacity of the shell, and the body has to be made with stout walls, or of very high-grade steel, not always available in war-time, to prevent the shrapnel from blowing to pieces instead of acting as a whole.

Weight of Shrapnel Bullets.—The weight of the shrapnel bullet, which is necessarily spherical, is of great importance to the effect. Elongated shrapnel bullets are out of the question, since the moment of impinging rotation of the shell is not sufficient for shrapnel to have effect. Section 95% of field shell, that is, 74% of total number, have failures. Of two spherical bullets the heavier will travel farther before pitching into the ground, and so will have a longer period of efficiency. The heaviest metal practically available for shrapnel bullets is hardened lead. Tungsten and other heavy metals have been proposed, but are not available in sufficient quantities for
ARTRILLERY

262

War requirements. The weight of the shrapnel bullets contained in a shell can therefore be increased only at the expense of their number.

In the other direction, the minimum weight of the bullet is determined by the necessity for providing sufficient disabling energy. It has been found experimentally that a striking energy of 60 foot-pounds is sufficient to disable a man. In the case of a bullet starting from the point of burst with an initial velocity of 1,000 ft. per sec., as in the British 18-pdr. at 4,000-yd. range, the striking energy after it has travelled 300 yd. is as follows:

<table>
<thead>
<tr>

<td>320 ft-lbs</td>
</tr>
</tbody>
</table>

It will be seen that under the assumed conditions the French bullet of 38 to the pound is only one which provides sufficient striking energy at 300 yd. from the burst. Of the nations which took part in the war, the French had the heaviest shrapnel (who had the French equipment) were the only ones who used the heavy shrapnel bullet. The other nations (except the Russians) considered that the trajectory of their guns was not flat enough to carry good proportion of the bullets to distances of 4,000 yd. Further, the distance of the point of burst from the target should be such as to produce the greatest possible effect. This also is a matter of ranging, but the gunner must first know what is the correct distance of the point of burst. The target surface of a man, measured at right angles to the trajectory of a shrapnel bullet, may be taken as 1/4 sq. yd. when standing, 1 sq. yd. when kneeling, and 4 sq. yd. when lying or firing over a parapet. The best effect is produced when the point of burst of the cone of bullets is such as to provide one effective bullet for each man. The density depends on the target surface offered by each man; it is equal to the number of bullets per square yard of the cone of bullets contained in 1 sq. yard. Taking a shrapnel containing 300 bullets, the cross-section of the cone at the target would have to be 150 sq. yards. The apex angle of the cone being about 4°, this would fix the best distance of burst at 35 yd. from the target. But the distribution of the bullets in the cone is not uniform. If it is assumed to be haphazard (which is nearer the truth), then, according to the Theory of Probabilities, the maximum effect is produced when the cross-section contains 1-24 bullets for each man. This gives the best distance of burst for the above shrapnel as about 50 yd. against standing men, 41 yd. against kneeling men, and 35 yd. against men lying or firing over a parapet. With the shrapnel used by the British, which contains 375 bullets, the best distances are 55, 48, and 35 yd., respectively.

The question of the distance of burst is affected by the error of the fire of the gun, which causes the point of burst to deviate from the point of hit. The deviating bullet fails short or long at a distance of burst 60 yd. over or short of the desired point, then if this be fixed at 40 yd. from the target some of the shrapnel will be wasted by bursting on the ground. Similarly, the error of the gun will cause short rounds to burst on the ground. In the British and in the French services it has been laid down that the distance of burst for field guns is to be such as to appear from the battery 10 minutes of angle (in French notation, as regards the point of burst, above the target). This corresponds to a distance of burst of 70 yd., and rather less at longer ranges, and gives about 10% of bursts on the target. This distance has been fixed partly with reference to the error of the fire of the gun (which is not constant but varies, and in particular is greater than in peace time), but principally for simplicity. When good fuzes are available better shooting is to be obtained by adhering to the theoretical or correct distances given above. Towards the end of the war the Germans used a number of very accurate time fuzes, and these come into general use the service length of 10 minutes above the target will no doubt be reduced.

Penetration.—A heavy Frankfort gunshell bullet will not pierce the thinnest of the steel gun-shields in use, and it is quite ineffective against infantry shields, loophole plates, and the plates of a tank. These shields are all made to resist infantry bullets, which have high velocity and not much penetrating power; leaded glass is far more effective. Steel shrapnel bullets will pierce gun-shields if the shrapnel be burst close up.1 As the steel bullets are larger than leaden bullets of the same hardness, their use entails a reduction of about 20% in the number of bullets required for the same result. This is one reason why the number of bullets per shell was increased, and why shell was increased. Occasionally the ground may be so hard and the angle of impact so small that the shell ricochets low instead of forming a crater and shower, viz. upwards. But generally speaking percussion fire with shrapnel at too short ranges is almost useless.

When a direct hit on a gun-shell is made with shrapnel shell the shell does not open till it has travelled several feet further, unless it hits the gun or some solid part of the carriage, and there is no bullet effect at all. In the French, the German, and the Russian, on a modern cellular ammunition box does not blow up the contents, though it may explode a H.E. shell if it makes a fair hit on it, and may set fire to some of the contents.

When percussion shrapnel are fired at a building the shell explodes as it passes through the wall, and produces good bullet-effect on anything behind, as in this case the shell is sufficient to give the base height a field howitzer, such as that of the British 4.5 in. shrapnel behind two walls, and this is literally correct; but there are so many windows in the front of a house that the shrapnel is liable to pass through them and burst through the back wall, and moreover, the fire of powerful modern field guns the front wall soon ceases to exist.

Owing to the charge of black powder which it contains shrapnel has considerable incendiary effect on buildings.

Perforating Shrapnel.—Shrapnel is invariably fused with time- and percussion fuzes, constructed to burst either in air or on grazé. The object of the percussion arrangement is almost entirely to assist ranging; for giving the gunner a ready indication that a shell burst on grazé is negligible, as the shell rises steeply from the crater before it opens, and the bullets are blown out in an upward direction, and lose their enabling power for some time coming down again. Occasionally the ground may be so hard and the angle of impact so small that the shell ricochets low instead of forming a crater and shower, viz. upwards. But generally speaking percussion fire with shrapnel at too short ranges is almost useless.

The theory of the effect of howitzer shrapnel is the same as for gun shrapnel. The weight of the bullet is increased to compensate for the low velocity. The angle of descent of the lowest bullet, including half the angle of opening, is about 40 degrees to the horizontal, so that a man would have to crouch very close behind a gun-shield or parapet to escape being hit. When burst at effective height a field howitzer shrapnel, such as that of the British 4.5-in. howitzer, covers a space 35 yd. wide and 70 yd. from front to rear.

Universal Shell.—These are combined shrapnel and howitzer shell; a type is described and illustrated in 1,800. The idea is that it can be used as shrapnel for covering a distance or as howitzer for covering a smaller area. The method is to lower the striking energy as the angle of impact, which is much less than with a flat-trajectory gun. Precise ranging and an accurate fuse are required to produce good effect. During the early or middle phase of the war the shrapnel fire from field howitzer seemed to excel all results; latter, however, the desire for procuring good time fuzes for howitzers brought this class of shell into disrepute, and it seems probable that its use will be discontinued except for light field howitzers, and even in these reserved to mobile warfare.

The theory of the effect of howitzer shrapnel is the same as for gun shrapnel. The weight of the bullet is increased to compensate for the low velocity. The angle of descent of the lowest bullet, including half the angle of opening, is about 40 degrees to the horizontal, so that a man would have to crouch very close behind a gun-shield or parapet to escape being hit. When burst at effective height a field howitzer shrapnel, such as that of the British 4.5-in. howitzer, covers a space 35 yd. wide and 70 yd. from front to rear.

High-Explosive Shell.—These were the principal projectile fired by all nations of land artillery during the long period of trench warfare in the western theatre of war. They are of two kinds, thick-walled shell and mine shell. The former have a comparatively small bursting charge and are intended to kill men with their splinters; the latter are thin-walled shell containing a large burster, and are intended to penetrate deeply before bursting, and to destroy fortifications and other permanent works. The thinner the shell, the less it is exposed only to a low pressure in the bore. In modern howitzers, which are required to range at least 50% further than those in use in England in 1916, it is possible that the shell will be fired at an ordinary time shrapnel. If the shell case is able to contain the charge it detonates like a H.E. shell. Such shell were used in the war, but their usefulness was always a matter of controversy and their employment was only adopted in the latter part of the war. High explosive shrapnel were manufactured for such purposes. present for them to collapsing in the bore, and tend to approximate to the thick-walled type.

Thick-walled shell are almost always fired with instantaneous percussion fuzes, the object of which is to fire them with time fuse in air. The object of the instantaneous fuse is to burst the shell on the surface of the ground before it has time to penetrate, so that the fragments come down to earth very close to the point of impact. Early in the war, the German howitzer shell, for want of an efficient instantaneous fuse, used to penetrate deeply into the soft clay of Flanders, and the result was a vertical erosion of mud and splinters which did a great deal of damage men not actually on the spot in such.
through a gun-shield, thin wall, thin parapet, etc., so as to produce splinter effect on troops immediately behind it. When an instantaneous fuse acts properly the effect, even on soft ground, is to form a small fire in the way of a spade; but such a fire is very infrequent. The effect expected from a bursting shell is to produce a fire which will penetrate the earth sufficiently to cast off splinters, and when it is of sufficient depth its bursting effect is slight; with howitzers fired at angles of elevation between 45 and 65 degrees, giving angles of descent of 55 to 75 degrees, the effect is almost equal in all directions.

The blast and shock of the splinters are of great importance. Owing to their irregular shape small splinters do not fly very far. The object of the ammunition designer is to get as many effective splinters as possible. The reason that the maximum killing weight is 25 grammes (0.88 oz.), though splinters as small as 10 grammes (0.35 oz.) may be effective close to the point of burst. It is not always possible to realize this ideal; the French field gun H.E. shell, weighing 11-68 lbs., gives 100 splinters only, effective splinters, averaging 100 grammes (3.52 oz.). The German 1914 field-gun shell, weighing 15 lb., gave 135 splinters averaging 1-66 ounces. A more recent projectile, that of the French 7-7-pdr. trench gun, gives 99 splinters of about 1-5 ounces. There is no simple way of designing a shell so as to produce any required fragmentation but a violent H.E. burster tears a solid metal shell to minute fragments, while a mild burst produces a large solid projectile with minimal damage to the interior of the emplacement; the designer has to adjust the violence of the burst to the hardness and "shock-test" strength of the steel so as to produce the desired number of fragments, as uniform in weight as possible, for the thickness and material of which the gun is made stresses to which the shell is subjected in the gun, and the shape and balance desirable for ballistics, have to be taken into account. However, manufacturers produce a fair approximation; thus Krupp claim that the 57-mm. field gun H.E. projectile, weighing 25 lb., and per kilogramme of field-gun shell, or about 9 per pound.

The French field-gun shell is effective over an area of 25 sq. metres, but with large calibres much more effective is obtained. A 6-in. howitzer shell, weighing 100 lbs., clears an area of 3000 sq. yards.

During the war considerable success was obtained in firing thick- walled gun-shields, with a bursting charge, so as to produce a slight delay action, so as to burst in ricochet in the air from 20 to 30 ft. above the ground. Ricochet fire is applicable only when the angle of impact is so small, and the ground so hard, that the shell has no chance of penetrating, and to obtain the maximum delay at 120 degrees the downward and lateral effect is good, and the forward effect is appreciable, though far inferior to that of time shrapnel. This method was evolved by the French before the war; the ricochet effect is styled the "capot de biche." It was used also for wire-cutting purposes.

Mine Shell.—With howitzers above 6 in., mine shell, not killing shell, are usually employed. With medium and heavy guns no depth of air is required as the explosion is sufficiently deep to penetrate into the nature of the ground; if the shell penetrates too deeply it forms a "globe of compression" or hollow chamber beneath the surface, while if it does not penetrate deeply enough much of the energy is wasted. The projectile of the M.I. Shell is designed for penetration. Shells of H.E. shell with the head removed, and of the ordinary Shrapnel type, were introduced in 1917 of 30-lb. weight, and were effective up to 60 yards. The projectile was 9-28 in. in diameter and was shaped to make a hollow in the shell. It was designed for use with howitzers effective up to 2000 yards and was used with howitzers of the 7-7-pdr. and 8-in. calibre. The projectile was made of solid steel with a hollow core filled with picric acid, which made the shell about 90 per cent. of steel and 10 per cent. of picric acid. The shell was a solid steel, of 17 in. thickness, with a diameter of 30 in. The projectile had an 8-lb. charge of picric acid in the core, the yield of which was over 12,000 lb. of gas, and sufficient energy to make this shell effective to 6000 yards. The shell was covered with a steel jacket and the failure of the shell was probably due to failure of the jacket.

Armour-Piercing Shell.—These have to be used against armoured tanks, and turrets and cupolas of land defences. The effect of field gun armour-piercing shell against tanks depends not only on the thickness of the armour it is intended to penetrate, but also on the material of which it is supported, and the angle at which it is struck. The following table of penetration for the British 18-pdr. gun used in the war may be taken as a guide. It is assumed in the table that the armour is effectively supported and that it is struck at an angle not exceeding 30 degrees to the normal. The formula is:

\[
\text{t} = \frac{v^2}{2500 - 4v}
\]

where \( t \) is the thickness of hard-faced armour in inches, \( v \) is the striking velocity in f.s., and \( d \) is the calibre of the gun in inches.

With larger calibres the effect increases in a somewhat higher ratio. But the number of rounds required for a given task cannot be ascertained directly from these premises, since much of the effect of subshell falling in the crater is wasted by displacing the earth already lifted, which has fallen back into the crater. A more reliable guide is the diameter of the crater, which varies according to the soil. In ordinary ground a 6-inch shell makes a conical crater about 4 yd. wide and 3 yd. deep, of which depth about one-third is filled up by earth falling back into it. Hence to destroy a 10-ft. crater it must receive one 6-in. shell per 4 yd. of front. If a calibre be employed which gives a crater of less diameter than the thickness of the parapet, this will entail a great waste of ammunition. Thus the French found that under practice conditions of accurate fire they took 11 rounds of field-gun shell per yard as against 20 for a parapet 10 ft. thick, or perhaps 20 rounds a yard under war conditions. Therefore they consider that for practical purposes a 10-ft. parapet is proof against field guns and 4-2-in. field howitzers.

VII. EFFECTS OF COLLECTIVE ARTILLERY FIRE

These vary so much according to local and tactical conditions that no exact rules can be laid down. However, the following were rough working rules established during the war:

**Standing Barrage.** — To keep down the fire of riflemen in a trench, each man should be liable to be killed if he shows himself above the parapet at least once a minute; therefore one shrapnel per minute should be burst in front of him. Taking the effective spread of shot from the highest, 4,000 yards, and the average per 100 yd. of trench required, is this an "ordinary" barrage, and may be changed to a "heavy" barrage of 500 rounds a minute or a "light" barrage of 300 rounds a minute. Required. This is a "heavy" barrage of 8 rounds a minute or a "light" barrage of 4 rounds a minute per 100 yd. of trench. If a 2-in. open fire battery has to barrage a trench of 400 yd. front, then at the "ordinary" rate each gun will fire 3 rounds a minute, distributed over the 75 yd. allotted to it. To barrage a communication trench "end on," 2 rounds a minute per 100 yd. of length are sufficient, when the line has been corrected to bring every burst over the trench. It is not necessary to barrage the whole length of a communication trench, which may be 2 m. long; aeroplane photographs show the most effective barrage points to be midway between obstacles and other obstacles not nearly round. Communication trenches may be so effectively barraged as to oblige the enemy to risk the chance of coming and going across the open.

**Creeping Barrage.** — This may be of several different kinds, as described above. With time shrapnel, or a mixture of H.E. and smoke shell, fired from field guns, a battery can efficiently barrage a front equal to its own normal front, or 20 yd. per gun. (The French reckon 15 per gun.)

In the British service the normal barrage rate was 4 rounds per field gun per minute for 2 minutes, then "lift" to the next range and repeat, and so on. On emergency a battery can cover a wider front for shorter periods; the comparatively slow rate of fire is due to the constant changes in elevation and setting of fuze, and possibly in direction as well. However, this rate amounts to 240 rounds an hour per gun, which is about as much as a battery can lay with no reference to a table of fuze or fuze droppers; at each range the battery will go into fire at the same range ("pounding") for some minutes. Owing possibly to worn guns, the German barrage was considered less dense and less effective than that of the Allies, although the nominal rate of fire was higher.

When firing a barrage with time shrapnel, the bursts must be kept low, and a setting of fuze giving 50% of bursts on or just above the ground is considered the best. With smoke shell instant barrages are kept at 50 yd., altitudes, that is smoke shell are not smoke shell in the barrage; in this case it may be better to use normal fuzes, in order to throw up more dirt and make a more opaque screen.

**Bombardment.** — It is found that a field H.E. shell displaces 4 cub. metres of earth per kg. of bursting, or 21 cub. yd. per pound.

At 6,000 metres the 240-mm. gun penetrates 180 mm., and the 155-mm. G. P. F. gun penetrates 77 mm. Ton bundles must be massive as well as stout, or else the effect of the blow will be to displace it and jam the rotating machinery, even if the shell does not penetrate. In the Liége and Antwerp cupolas, which were intended to resist 6-in. guns, lead cushions were used to reduce the "racking" effect. A small cupola of three masses in diameter cannot be expected to stand blows from heavy shell, though it may be stout enough to resist penetration. The striking energy of a 12-in. shell at 5,000 yd. is about 100,000 lb. foot-tons.

At the beginning of the war, a fort was at a disadvantage in that its position was known, whereas it was fired on by long-range guns which could not be located, unless the aircraft of the defence retained the movements of the fort. The development of sound-rangers helps the defence in this respect, provided that the instruments can be set up in several forts connected by telephone.
ARTOIS, BATTLES IN (CAMBRAI-LE CATEAU, 1914)

Plate 1.
proceeded to despatch forces to their northern flanks, with the object of outflanking the hostile battle line. There thus ensued what is known as "the Race to the Sea," which ended about the middle of Oct. in the establishment of a continuous front from the Belgian coast to Switzerland. On this front, after a series of furious battles which raged until well into Nov., both sides settled down to trench warfare on the advent of winter.

The first attempt to outflank the German right N. of the Oise was entrusted to the French Second Army, under Gen. de Castelnau, which was transferred from Lorraine from Sept. 10 onwards. This army, consisting of the XIII., IV., XIV., XX., and XI. Corps, was eventually opposed by the German IX. Reserve, II., XVIII., XXI., I. Bav., II. Bav. and XIV. Reserve Corps, brought up from various parts of the line, and after heavy fighting, in which first one side and then the other held temporary and local advantages which proved impossible of exploitation, these forces were left facing each other on the general line Lassigny-Roye-Chaulnes-Albert-Hebuterne, on which they finally fortified themselves. The battle on the front of the French Second Army died down in this fashion about the middle of October. At this time the French army was in the fourth week of the mutual attempt at envelopment by both sides had brought about an extension of the fighting to the neighbourhood of Arras and Lens.

**Battle of the Tenth French Army around Arras, Sept. 29-Oct. 10.**—The front of the Second Army was prolonged to the N. by the group of Territorial Divisions (the 81st, 82nd, 84th and 88th) under Brugère, which had been ordered on Sept. 29 to push forward detachments to cover the detachment of reinforcements at Arras and Lens, and by the 1st Cavalry Corps (Conneau) (1st, 3rd, 4th and 7th Cavalry Divisions) which was holding the line of the Coojeul on the left of the territorials. On Sept. 30 Gen. de Maudhuy was given command of a "Detachment of the Second Army," consisting of the X. Corps, two divisions (the 70th and 77th) formed into a Provisional Corps under D'Urbal, and the 1st Cavalry Corps; his orders were to concentrate in the region of Arras and to act against the right flank of the German corps facing the Second Army.

It was believed that this flank would be found about Bapaume. Of the forces at Maudhuy's disposal the X. Corps was on this day marching from Amiens in the direction of Arras, being still some two days' march from the latter place, while the divisions of the Provisional Corps were commencing to detach at Arras, covered by the 1st Cavalry Corps in the line of the Coojeul and a mixed Territorial detachment at Douai.

The situation of the enemy on the front of the detachment, somewhat obscure on Sept. 30, became clearer on the following days. Strong hostile forces (the IV. German Corps) were reported as moving N. and halting for the night in the neighbourhood of Quéant, with the evident intention of falling on the flank of the Second Army, at this time around Courcelles. The advanced guards of these columns had got into contact with the French cavalry on the line of the Sensée. Further to the N. other German troops (the I. Bavarian Reserve Corps) had driven the advanced troops of the Territorial detachment back to Douai.

Despite the fact that the battle showed as yet no signs of dying on the Second Army front, that the enemy were pressing hard against his centre, and that a shortage of munitions was beginning to make itself felt, Gen. de Castelnau adhered to his original intention of enveloping the hostile left with the detachment under Maudhuy on Oct. 2, and orders to this effect were sent to the latter on that evening; Maudhuy had already made his preparatory dispositions. The X. Corps was to be assembled around Ficheux, the divisions of the provisional corps N. of Neufville Vitasse and at Gavrelle, the Cavalry Corps N. of Monchy-le-Preux; all were to be in position by 6 A.M. The X. Corps and the 77th Division and the main body of the cavalry were to be ready to advance south-eastwards next morning against the flank of the enemy around Quéant, while the 70th Div. at Gavrelle was in a position either to cooperate in this advance or to deal with any hostile forces advancing by Douai.

In continuation of these instructions, the X. Corps was directed early next morning to move eastwards to Mercatel, whence it was to advance against the line Ervillers-St. Leger, and thence in the general direction of Mory, as soon as orders were received from Gen. Maudhuy.

Before, however, the X. Corps had reached its area of concentration around Mercatel the 77th Div. on its left was assailed from the E. by newly arrived German troops (the IV. Corps), who forced it back from the Coojeul to the line Guemappe-Monchy-le-Preux, while at the same time the I. Bavarian Reserve Corps, which had entered Douai on the evening of the 1st, was pushing its advance westwards to the north of the Scarpe—an advance which the 70th Div., delayed in its march from Lens, where it had detained, to Gavrelle, was not yet available to oppose; the X. Corps was therefore ordered to change the direction of its proposed advance from S.E. to N.E., and assigned as its new line of attack the course of the Coojeul and as its objective the crest N. of Croisilles and W. of Henencil.

The Corps would thus strike in flank the enemy advancing S. of the Scarpe, who by 2 p.m. had taken Monchy-le-Preux and drew back the 77th Div. to the line Vitasse-Vtheux-Chapelle. Meanwhile the 70th Div. on the N. bank of the Scarpe, advancing towards Gavrelle, had been held up and thrown on the defensive on the front Rouvroy-Izel-Bailleul, so that between it and the 70th Div. to the S. there existed a wide gap, which the 1st Cavalry Corps was urgently ordered to fill to the best of its ability.

Owing to the change of direction which had been ordered the attack of the X. Corps was not delivered till the late afternoon, and made little headway against the IV. German Corps, so that at the end of the day a further gap in the French line was formed between the left of the X. Corps and the right of the 77th Div., which had to be filled by troops from the general reserve. Gen. de Maudhuy, despite the disappointment of the day, ordered that the X. Corps should be prepared to resume its attack next morning, the 3rd on the N. bank of the Coojeul in the direction of Monchy-le-Preux, while the remainder of the detachment was to maintain its positions of the previous day.

The X. Corps, however, met with no better fortune on this day; the Germans maintained themselves in Neufville Vitasse after heavy to-and-fro fighting, and the retirement of the Territorial troops to the S., who were forced out of Courcelles by the attacks of the German Guard Corps, compelled the X. Corps to fall back on its right in conformity with orders, so as far as the line Ficheux-Mercatel. Both the 77th and 70th Divs., however, succeeded in repelling all the violent efforts of the enemy; the gap between these two divisions in the Scarpe valley was successfully closed by Conneau's 1st Cavalry Corps; and reinforcements consisting of the XXI. Corps (Maistre), detaining at Amantieres, Merville and St. Pol, and the 2nd Cavalry Corps (4th and 5th Cavalry Div.) under De Mitré, then holding the front Benfontaine-Lens, were placed at the disposal of De Maudhuy. These forces were increased by the 45th Div. detaining at Arras, which was assigned to D'Urbal's corps to cover the front.

On the front of this corps fighting continued throughout the night, and the 70th Div. was forced to withdraw some three miles westwards to the line Vin-y-Farbus-Bailleul, along the eastern slopes of the Vin-y ridge. This regiment uncovered Lens, which fell into German hands early on the 4th. The situation of the detachment, which now found both its flanks in the air, was by no means an easy one; Maudhuy's orders for the 4th, however, were that the positions then occupied were to be held at all costs. The X. Corps was to maintain itself on the line Filloy-Beaurains-Mercatel, with its right flank thrown back if necessary to Ficheux, and to re-establish the connection with the left of the Second Army which had been lost owing to the retreat of the Territorials. D'Urbal's corps was to hold its ground on the front Vin-y-Bailleul-Aties-Feuchy Chapel, so as to allow time for the XXI. Corps to advance by L'Basse against the flank of the I. Bavarian Reserve Corps, which was attacking N. of the Scarpe. The 1st Cavalry Corps was to
secure the left of D'Urbal around Givenchy-en-Gohelle. One brigade of the 43rd Div. which had already been despatched to Arras was sent forward to reinforce the Provisional Corps, and the second was detained at Beaumetz and passed on to Duisans in general reserve.

The German attacks continued without cessation throughout the 5th.

Prince Rapppecht of Bavaria, commanding the Sixth German Army, arrived at Douai and took command of the whole battle front between the Somme and the Lys. On the French side Gen. Foch was entrusted with the coordination of the front N. of the Oise, and with the general control of the Second Army, the Territorial group, the 1st and 2nd Cavalry Corps and Maud'huy's command, which now became the Tenth Army; Foch moved his headquarters to Doullens on the 5th, Maud'huy's remaining at Aubigny.

During the greater part of the day the Tenth Army successfully held its ground, but in the evening its left was forced to retire still further W. by the vigorous attacks of the 1st Bavarian Reserve Corps, to the N. of which the 2nd German Cavalry Corps of von der Marwitz was now coming into action. Givenchy fell into the hands of the Bavarians, and while their right advanced beyond it to Souchez their centre assaulted and carried the Viny ridge as far S. as Thelus; the French cavalry were driven back to Villers au Bois and Mont St. Eloi, while the 70th Div., reinforced by all available troops of the 43rd Div., again made head against the enemy on the line Carency-Neuville St. Vaast-Rouclincourt-Athies. This was the situation reported to Gen. Maud'huy on the morning of the 5th; and shortly after this had news been received the X. Corps announced that its right had been forced back from Bois-leux, where it had maintained itself throughout the previous day, to Ficheux; that hostile columns were reported moving round its flank by Blaireville; and that the stations of Beaumetz and Saulny on the Arras-Doullens railway were being bombarded.

This was about 10 A.M., and in view of the extreme gravity of the situation on both his flanks Gen. Maud'huy was already taking preparatory measures for the evacuation of Arras and for a withdrawal in the direction of St. Pol, should such become necessary as a result of further progress by the enemy, when Gen. Foch arrived at his headquarters and it was decided to make another effort to restore the position. The Germans had not pressed their advantage against the left of the army to the extent that had at first been feared; the Cavalry Corps was therefore ordered to advance against the right, which had pushed no further forward than Souchez, and disengage the left of the 77th Division. D'Urbal's corps, which was about to fall back to the line Mont St. Eloi-Etrun-Varlus (W. of Arras), was directed to maintain its ground with its right and centre and cooperate with its left in the attack by the cavalry. Meanwhile reconnaissances had revealed the fact that neither the German IV. Corps nor the Guard had yet taken advantage of the gap between the X. Corps on the right of the Tenth Army and the Territorials on the left of the Second Army; the former was therefore instructed to maintain its line and echelon troops in rear of its right between Ficheux and Gouy. Accordingly on the evening of the 5th the X. Corps had established itself firmly on the front Beaumetz-Riviére. The attacks of the Cavalry Corps and the 70th Div., however, made no headway, and their line was established at the end of the day at the western foot of the Viny ridge on the front E. of Mont St. Eloi-S. of Neuville St. Vaast-Ecury-Roclincourt-St. Laurent. Further S. the line was continued by the 77th Div., which had been drawn back in conformity with the retirement of the formations on both its flanks to the second position prepared in rear, between Blangy and Tilloy.

The orders for the 76th were for a renewal of the attack on the left wing of the Tenth Army; it was to be carried out by the 43rd Div. (of the XXI. Corps) which was assembling W. of Carency, the 1st and 2nd Cavalry Corps which were to advance between Souchez and Lievin, and the XXI. Corps (less the 43rd Division) which was to envelop the enemy's right advancing by La Bassée and Lens on Vimy. Various untoward circumstances combined to thwart the execution of this plan. The attack of the Cavalry Corps began late and with insufficient forces, could make little impression on the strong front held by the enemy between Notre Dame de Lorette and Angres, and the 43rd Div. to the S. of it was also held up, while the enveloping attack of the XXI. Corps from La Bassée failed to develop. While the Tenth Army was thus engaged Foch on the evening of the 5th ordered the line Beaumetz-Arras (X.Corps), Arras-W. of Neuville St. Vaast (Provisional Corps)-Carency-Aix-Noulette (43rd Div. and Cavalry Corps)-S.E. of Grenay-Loos (XXI. Corps) with cavalry towards Pont à Vendin and Carvin. Arras was being shelled by the enemy. According to army orders the XXI. Corps commenced its attack early on the 9th against the enemy reported to be on the line Angres-Liévin-Lens, while the cavalry and the 43rd Div. continued their endeavours to press forward towards Notre Dame de Lorette and Souchez. The Germans, however, had strengthened their positions during the night, and little progress could be made. Moreover, it had become evident that the battle line must be extended yet further to the N. in order to meet a renewed German attempt to envelop the French left by the valley of the Lys. Accordingly the 1st and 2nd Cavalry Corps were withdrawn from the battle-front in the late afternoon preparatory to their despatch to the N., the 13th Div., then in the vicinity of Lille, being ordered S. to take their place in the Tenth Army. On the rest of that army's front the situation underwent no important change during the 7th.

From this date forward the fighting at Arras died gradually away. Renewed efforts by the XXI. Corps on the 8th and 9th ended in the recovery of Notre Dame de Lorette. On Oct. 10 further fighting E. of Arras resulted in an advance by the 10th Corps, and on the 22nd the 77th Div. was forced back N.E. of Arras by strong enemy forces, who were compelled next day to relinquish part of their gains.

These were but the dying flickers of the fire of battle which had long since shifted its main focus to the north.

Extension of the Battle to the Lys Valley, Oct. 1-12.—While the battle of Arras was still at its crisis, the German right wing was already being extended further to the N. into Flanders. On Oct. 3 a mixed detachment of Landwehr entered Tournai; the 4th Cavalry Corps (3rd, 6th and Bavarian Cavalry Divs.) had come into line on the right of the 1st Cavalry Corps, which was then engaged with the French 2nd Cavalry Corps, with its right S. of La Bassée. The right of these fresh forces advanced on Lille, from Tournai and Orchies, while its left advanced from Douai on La Bassée; by the 4th contact had been made with the French in the western outskirts of Lille.

To meet this new threat the French Higher Command had moved up the 2nd Cavalry Corps (4th, 5th and 6th Cavalry Divs.) under De Mitry to the area between Lens and Lille, and had garrisoned the latter city with the 17th Div. (of the XXI. Corps) which had been detached at Armentières, covered by the 7th Cavalry Division. The first attacks of the German cavalry on the city were beaten off and the suburbs cleared; but, as has already been related, the 13th Div. was then called away to the S. to rejoin its corps, and left behind it only a weak detachment of six battalions and four squadrons to hold the city, and of these two further battalions were withdrawn on the 9th. Meanwhile to the S. between Lens and the Béthune-La Bassée canal the XIV. German Corps had come into line, forcing back the French cavalry to the W. of the Lens-La Bassée road to the line Vermedes-Cambrin. On this line heavy and continuous fighting took place from Oct. 10 onwards, where the position gradually became stable.

Further to the N. the German cavalry continued their advance, extending their right as far as and beyond the Lys and covering the whole country from La Bassée by Lille, Tourcoing and Wervicq to Ypres. The centre and left of De Mitry's cavalry fell back before them, pivoting back on their right from Neuve Chapelle by Estaires and Merville to Hazebrouck and Cassel; this line was reached about Oct. 9. The main body of the German
cavalry appeared to be assembled around Baillieu and Steen-voorde, while behind it strong forces of infantry were advancing, the XIII. Corps to the S. and the XIX. to the N. of Lille. The garrison of the city, although reinforced on the 10th by a detachment, were unable to make head against these overwhelming forces, more especially as the presence of the German cavalry in all the area to the W. deprived it of all hope of succour; and after two days’ bombardment Lille surrendered to the enemy with its garrison on Oct. 12.

The battle, however, was now about to enter on a new phase with the entry into action of the British army.

**Operations of the British in the Lys Valley, Oct. 10-18.**—The transfer of the British from the Aisne to the left flank of the French army in Flanders had first been proposed by Sir John French on Sept. 29; the details were quickly arranged between him and Joffre, and the withdrawal of the British from Flanders was about to begin, and a large force was detached, and transferred to the British Army under Gen. Rawlinson, which had been landed on the Belgian coast in order to assist the Belgians in the defence of Antwerp and had assisted in covering their retreat to the line of the Yser; the 6th and 7th, 9th, 29th, 32nd, and 52nd Divisions and the XVIII. Corps, each of three divisions, had crossed the Lys to Ghent on the 11th, and were instructed to maintain themselves between that town and Courtrai for four or five days, if possible; it was intended to bring the rest of the army up on the right of the IV. Corps, so as to hold the Lys line from Ghent southwards. Rawlinson had authorized, however, in case he was attacked by strong hostile forces, to fall back in the direction of St. Omer, and as a matter of fact the retreat of the Belgians to the N. of him eventually necessitated his retirement by way of Théilt and Thourout to Roulers, where the IV. Corps arrived on Oct. 12, un molested by the enemy.

On the 10th French visited Foch, and a plan for a combined Allied offensive for the 13th, to reach the line of the Lys from Lille-Courtrai, was then drawn up. The British were to advance with their right N. of Lille, to force the river Lys at Courtrai and join up with Rawlinson’s IV. Corps below that town. The Belgians were also to cooperate in the north. In accordance with this plan, the British cavalry pushing forward on the 11th came into contact with the German IV. Cavalry Corps, operating before the right wing of the VI. Army, in the neighbourhood of Nieppe forest, and forced them back towards the Lys; the II. British Corps reached the line of the Aire-Béthune canal. By the 12th the cavalry had cleared the enemy to the E. as far as the Wytschaete-Messines ridge and pushed patrols forward to the crossings of the Lys; but the II. Corps, wheeling up its left in the direction of Merville, became heavily engaged with German infantry (the XIII. and XIX. Corps of the VI. Army), which prevented their making much headway. The III. British Corps, having completed its movement to Hazebrouck by the 13th, began its advance eastwards, to bring it level with the left of the II. Corps. This objective, however, was not attained without serious and sustained fighting; the Germans (XIX. Corps and IV. Cavalry Corps) stubbornly defended Baillieu, Meteren, Neuve Eglise, Stilly and Nieppe one after the other; by the 16th, however, the British were in possession of all these places. The II. Corps also had worked their way forward by dint of determined efforts to the line Aubers-Givenchy, and came into touch with the XIX. Corps on the left of the French X. Army, on the Béthune-La Bassée canal.

While the II. Corps, despite determined and unceasing attacks, found further progress impossible beyond the line Givency-Festubert-N. of Aubers, which it reached on Oct. 18, the III. Corps entered Bois Grenier and Armentières, and was able to establish itself on a line E. of these places, while the Cavalry Corps, guarding their left, continued the line along the Lys to Menin. By the morrow the assembly of the British army in the N. was completed by the arrival of the I. Corps at Popinghe, St. Omer and Cassel. The battle of the Lys now became merged in the greater battle of Ypres, in which the whole British force was engaged from Oct. 20 to Nov. 10, and the description of the fighting between these dates on the front of the British II. and III. Corps will be found under that head. It may be said, however, that neither the British nor the Germans, despite their utmost efforts, succeeded in bringing about any material change in the situation on the front between the Béthune-La Bassée canal about Givenchy and the Lys to the N. of Armentières.

**(B) French Offensives in Artois, 1915**—During the month of Oct. 1915 the western front had stabilized across Picardy and Artois, from the Oise to the neighbourhood of La Bassée. The line had not been chosen at the will of either party, but marked the points which each side had reached and held during the several days of rapid advance. It began as "Between the Sea." While there was still open country to the north it had been worth no one’s while to attempt to dislodge an enemy present in any force. And when the sea had been reached and the German attacks upon the Yser repulsed, neither side retained the energy to advance. Both, therefore, had time to elaborate their defences in comparative peace, and thereby the sinuous and haphazard line already established became permanent.

About Arras the line bulged eastward, leaving Beaumars German but making St. Laurent-Bingy, Roclaing, and Ecurie French. To the north was a westward bulge which gave the Germans Neuville-St Vaast and La Talarterg, Carency and Abblain, Angres, Liévin, and La Fosse Calonne. North of Fosse Calonne the line ran straighter to the west of Loos, Hulluch, Haisnes, and La Bassée.

Artois is a chalk country. The surface soil is clay, with patches of sand unsuitable for cultivation and therefore wooded. The principal natural feature of the region is a long isolated ridge running from N.W. to S.E., which overlooks all the country. This ridge culminates at the chapel of Notre Dame de Lorette. East of the chapel there is a gap marked by the village of Souches. East of Souches again, the ridge continues as Vimy ridge and gradually dies away south of Vimy village.

The sector was of first-rate importance both for economic and for strategic reasons. North of the ridge ran the principal French and Belgian coal seam the axis of which in Artois is roughly the line Béthune-Lens. Although the public mind was naturally slow to grasp the fact, nevertheless as soon as it became clear that trench warfare would result in the postponement of a decision, first-class economic objectives, such as the coal-mines, began to increase in general military value and continued to do so until the decisive campaign of 1918.

Strategically, the German lines in Artois covered the Lille- Douai-Cambrai railway, their main transverse line behind all this part of their fronts. Should this line be cut, were it even bought under effective artillery fire, their railway traffic would be compelled to use the inferior line Lille-Orchies-Somain-Cambray.

Although the final elaboration of trench warfare was a matter of years, its general characteristics, especially the strain and hardship of remaining immobile and in close contact with the enemy, appeared at once. The possibility of manoeuvre disappeared and war became an affair of ever-increasing masses of material. In Artois, the importance of the sector and the nature of the soil made the fighting fierce and continuous and the hardships peculiarly bitter. The clay soil churned into a solid and sticky mud into which men sank deeply and sometimes even were lost. Everywhere the ground was humid; the Lorette ridge itself was honeycombed with springs so that trenches dug even on its summit were difficult to keep clear of water. Weapons often became unserviceable, and the men themselves looked like walking lumps of mud. Nevertheless, the fighting was not only savage but continuous. A major operation was merely a crescendo in a never-ending series of furious lesser combats, all centring about the commanding Lorette-Vimy ridges.

Throughout the first three years of trench fighting on the western front, in most of the minor operations, and in every
major operation except Verdun, the Allies attacked. Save in that one case, the Germans held to their decision to stand upon the strategic defensive in France and Belgium, from Nov. 1914 to March 1915. In order to attempt a decision, it was, therefore, necessary to attack them at their front. The strength of the defenders in trench warfare, and the corresponding difficulty of the attack, were realized only with time.

Originally, the entire Lorette ridge was occupied by the Germans during the race to the sea; the French swept them off in a brilliant little attack. Then the Germans moved in again and took the chapel and the eastern end of the ridge nearly to the wood of Buvigny, not by assault but because the place had been left entirely unguarded during the night of Oct. 7-8 in the course of a relief of the French troops in the sector—an incident altogether typical of the race to the sea. As regular trench warfare began, the Germans had the initiative of the artillery fighting. Their guns were both heavier and more numerous, and their fire control better suited to the new and unexpected sort of fighting. Their batteries were emplaced near Liévin and Angres, behind Vimy ridge, and behind the butte of Monchy-le-Preux. In Nov. they began to use hand grenades, the first of the typical trench weapons to appear, or rather to reappear. The French did not begin manufacturing grenades during the following winter, and were not able to issue them to the troops until March 1915. Nevertheless, despite the German heavy artillery and grenades, the month of Nov. saw such an improvement in the French defensive work that casualties became fewer, although it was not yet possible to put out continuous fire.

Early in Dec. the situation changed for the better with the arrival of several units of French heavy artillery, whose fire compelled the Germans on Lorette ridge to take cover in their deep dug-outs. The French Higher Command ordered the XXI. Corps, which had held the Lorette sector since its stabilization, to attack in the hope of a break-through. The Corps commander, Gen. Maistre, was doubtful of the success of the operation proposed, judging the means insufficient and the obstacles to be encountered too strong. Nevertheless, the attack took place on Dec. 22 at 11:55 A.M. on the front of a mile and a half, and with diversions against Auchy-la-Bas see and Loos, and in front of St. Laurent-Blangy. Near Lorette the artillery preparation had not been sufficient to prevent the attacking troops coming under heavy fire, especially from machine-guns, as they left the trenches. The German fire was strong and had been very little cut. Nevertheless, they struggled on through deep mud, and succeeded in taking some trenches. For four days the operation was persisted in. The artillery support was weak, partly because of the winding, irregular front line, partly through insufficient liaison with the infantry. Against such handicaps the infantry strove bravely but in vain. At last, after murderously fighting the trenches which they could not yet defend, the Corps, which always fought well Gen. Maistre's forerunners, the attack was broken off.

An unbroken series of minor operations took place throughout the winter and early spring. In the afternoon of Dec. 27 ten battalions of Chasseurs Alpins, commanded by Gen. Barbot, attacked the hamlet of La Targette, after two hours of artillery preparation. "No-man's-land" was here a quarter of a mile wide, quite flat and without cover save for a single sunken road. Hence losses were heavy and only half a mile of first-line trenches were taken.

As the winter went on, the sticky mud became even worse, and the heavy German trench-mortar projectiles added still more to the danger and discomfort of the trenches. On March 3, at dawn, after a short but violent preparation by heavy artillery and heavy trench mortars, an entire German division made a sudden attack along the crest of the ridge, and drove the French into Buvigny wood. Two days of counter-attacks recovered most of the ground lost, and throughout March and April a series of local attacks and counter-attacks slightly improved the French position at a cost in casualties disproportionately large in comparison with the ground gained. The dead were not all Frenchmen. Already the German troops were beginning to call the ridge "Totenkopf," the Hill of Death. In April the first French 58-mm. trench mortars, few in number, were put in service. The French had already begun the use of hand grenades in March.

About May 1 the French Higher Command decided upon a general attack, and chose Artois as its sector. It was desirable that something be done on the western front in the hope of relieving the pressure upon the Russians, on whose front the great blow was about to fall. The British agreed to support the operation by a diversion in Flanders.

From the original formation of the French "Group of armies of the North," Gen. Foch had been in command. This command he still retained, and his was the decision as to the length of front to be attacked. Even at this early stage of trench warfare, he saw clearly that to estimate the possible width of an assault according to the number of infantry available was nonsense. He therefore insisted upon calculating the front to be attacked according to the available quantity of heavy artillery, insisting that a clear superiority in heavy pieces was necessary over the full width of the operation proposed. On the western front as a whole, the Germans still disposed of superior numbers in this particular arm, so that it seemed impossible to obtain a sufficient superiority of fire over a front of much more than six miles. As a result of Foch's insistence the width of the attacking front was limited accordingly. The right of the proposed assault was fixed in the neighbourhood of Roclincourt, the left on the northern slopes of Lorette ridge. At this stage of the war it was still believed that a violent effort, even on so restricted a front, stood a fair chance of breaking through the opposing trench system and restoring a war of movement.

From May 4, the German Higher Command was convinced that a considerable attack was to be expected. Nevertheless, so high ran their hopes of victory in the east that even Falkenhayn, usually so chary of reinforcements for that theatre, drew yet another division thither from France.

In Artois, the French order of battle was as follows: the left of the XVII. Corps was around Roclincourt. North of them stood the XX. Corps, its left facing La Targette and extending a little north of that village. Northernmost was the XXII. Corps, commanded by Pétain, the future commander-in-chief of the French armies on the western front. His extreme left faced Ablain. North again of the XXXIII. Corps, astride the Lorette ridge and on to the Arras-Béthune high road, stood the XXI. Corps which, always under Maistre, had held the sector from the beginning. The XX. and the XXXIII. Corps had three divisions each, the other corps two. All four corps formed part of the X. Army, now commanded by D'Urval, who had relieved Mauld'huy, the original army commander, in March. Foch shifted his headquarters from Cassel to Frevent on the Doulens-St. Pol road in order to follow the operation more closely, with only one corps at the prospect of quitting the foul and muddy trenches, and in the hope of fighting in the open trench forward.

Opposite them, the German defences were formidable; indeed the painstaking German national character is well adapted to the construction of elaborate works. Each of the solidly built French villages was a complicated little citadel. North of Ecurie a huge tangle of trenches formed a strong point, known as the Labyrinth, covering more than half a square mile. A series of works, known to the French as the "Ouvrages Blance," ran in a concave line from a hummock in front of La Targette to the western end of Carency. On the Lorette ridge itself, the ground favoured the defence. The southern slopes were precipitous and were, moreover, cut by deep ravines which the French likened to the grooves in a melon rind. Of the five spurs between these ravines, the Germans held the easternmost three, their front line running from a point a thousand yards west of the ruins of the chapel, across the summit of the third spur, and so to the western end of Ablain—a curious position which only the great strength of the modern defensive made possible. To the

1 Falkenhayn, Die Oberste Hreuverteitung, p. 74. At this period, Falkenhayn says, the total German combatant strength in the western theatre was 1,900,000 against an Allied total of 2,450,000.
Reproduced by permission from the map of France on the scale of 1:320,000, published by the Service Géographique de l'Armée.
north the ground fell away gently in an even slope broken only by the unexpected Buval ravine. The entire German part of the ridge was covered with trenches and obstacles and swept by batteries (at ranges of two to three thousand yards) around Liévin and Angres and behind Vimy ridge.

The troops which held these defences belonged to the German VI. Army which held the front from south of Ypres to within 20 m. of Arras. It comprised 16 divs., at a combat strength of about 17,000 per division according to the reduced German divisional organization dating from the early winter of '14. This gave a little less than three men per yard of front considering the irregularities of the line. Crown Prince Rupprecht of Bavaria commanded the army, with Maj. Gen. Kraft von Dellenberg for chief-of-staff, and headquarters at Lille.

On the 7th, Gen. Neuville, 7th Corps, ordered the 75th and 77th, was put off to the 8th and then to the 9th. Demolition fire began on the 7th and continued on the 8th, especially against the region of Neuville and the Labyrinth, but was hindered by the lack of all observation from the ground (no commanding points being in French hands), and by the serious imperfections of the aerial observation attempted by planes and dirigibles. The morning of the 9th dawned fair, with a light mist that soon cleared away. At six o'clock an intense bombardment was opened along the whole line from Loos to Arras, with heavy, divisional, and trench artillery. On the front of the XXI. Corps the 75's held their fire until eight o'clock, then began, and continued, at the rate of four shots per piece per minute. Amid the din of the bombardment, the French observers saw the German positions lost in vast clouds of smoke and dust sent up by the exploding shells. The German artillery replied energetically, searching for the French infantry assembled for the assault and occasionally hitting them with considerable effect. At 10 o'clock, precisely, the French artillery automatically increased the range and the infantry attack began.

The assaulting troops left their jumping-off trenches without signal. In a few moments it was clear that both wings were held up. The XVII. Corps could not make a foot, the mortar in front of them was still intact. The X. Corps, attempting a diversion east of Arras, uselessly lost 3,000 men in 10 minutes from machine-gun fire. North of the XVII., the right of the XX. Corps was helpless in front of the wire of the Labyrinth. The left of the XX. was doing better, the wire in front of them having been cut by the bombardment. In spite of heavy losses from German machine-guns still in position, they slowly cleared La Targette, fighting hand to hand, and by 11:30 they had advanced a little over half a mile and reached the westernmost houses of Neuville. On the ridge, the XXI. Corps was advancing only very slowly as a cost of murderous losses. Their attack was peculiarly difficult to organize for want of a single conspicuous object in their front to serve as reference point for the artillery, and upon which the infantry could align their advance. Their assaulting elements came under heavy machine-gun fire as soon as they showed themselves, so that the communication trenches were obstructed by numbers of wounded who blocked the reserves. Machine-guns firing northward from Ablain made advance impossible along the southern slope. On the plateau itself and the northern slope, swept though they were at short ranges by the German batteries around Angres and Liévin, there was a slow and painful advance of about half a mile, which took three successive lines of trenches and reached, at noon, the neighbourhood of the chapel and the land N.W. of it. Through the morning, the extreme left of Pétain's Corps, the XXXXIII., was fixed in front of Ablain. Other units, fighting every step of the way, were slowly working forward south of Carency.

Meanwhile, the right of the XXXXIII. Corps had broken clear through the German line. Here, alone on the attacking front, the wooded hill of Berthonval had given good hand observation by which to direct the bombardment. The wire had therefore been cleared, and most of the machine-guns put out of action. Carrying conspicuous markers to enable the artillery to follow their march, the infantry swept forward without a check. In the intoxication of such an advance after a winter in the abominable trenches, they got out of hand and ran forward, cheering as they rushed the German elements that tried to resist them. They crossed the Béthune road, gained the crest of Vimy ridge, and looked down upon the rolling plain to the north and east, toward Lens and Douai, with no more German troops before them. Hundreds of prisoners had been taken, it was only 11:30, and they had advanced over two and a half miles.

Naturally, the German command was frightened. Partially, at least, they had been surprised, for they had assembled no reserves. Twenty miles away, in Lille, the Prince of Bavaria's staff began packing up, for if the gap could be widened the whole front would go. But naturally, the assaulting troops were completely exhausted. They had run and yelled too much and their water-bottles had been emptied too quickly. During the advance, officer casualties had been numerous. About a mile of the crest between 110 and 140 was occupied, and patrols were pushed forward to Souchez and Givenchy.

Everything now depended upon the arrival of reinforcements. With them everything might be hoped; without them it would be hard to hold the ground already gained, limited as it was by concentric machine-gun fire from Souchez, Neuville, and La Folié wood; and no reinforcements came. The advance had been faster than had been planned, and either the army staff work was slower than the necessary orders not issued in time, or else the units ordered forward failed to make good speed. Perhaps, after all, the thing was impossible. Certainly no good road ran east into the newly created salient. At all events the opportunity was lost.

On the German side, when the first moment of panic had passed, the reaction was rapid. Great and deserved credit was won by the staffs concerned. During the afternoon, enough battalions from the second line of the division near by were scraped together for a counter-attack (supported by artillery behind La Folié wood) which retook the crest. The French-African troops, with most of their officers gone, failed to do themselves justice. All this time Neuville and Carency were holding out, and the XXI. Corps could not clear the Lorette plateau. Towards evening the cemetery south of Souchez had to be abandoned. Through the night, third-line battalions from the neighbouring German Army Corps began to come up. The French maintained themselves with difficulty at the Cabaret Rouge and along the road from Souchez to Neuville. The golden moment had passed.

During the next three days, the French improved their positions in vigorous local operations, taking the débris of Lorette chancel, Carency, and most of Neuville. By June 1 Ablain, the sugar-works west of Souchez, and the south-eastern slopes of Lorette were cleared. June saw the Labyrinth pain-fully occupied, and a narrow and difficult salient (including a bit of Vimy crest) first thrust out eastward from the Cabaret Rouge and then withdrawn. About the same time the Germans were pushed off the north-eastern slopes of Lorette—their last foothold on that murderous ridge now thickly covered with the dead of both sides.

The diversions attempted meanwhile by the British had failed to affect the general situation.

Practically, the spring offensive in the Artois had partially succeeded. Twenty-five square miles had been gained, the enemy's local resistances had been beaten down, for some hours his front had been pierced. But strategically, the operation had failed. The German front had been very slightly modified and the Russians had been helped in no way.

During the summer, the usual round of little fights went on, barren of results but endured always with the same spirit. In Aug., trench knives were issued to the French infantry for the first time.

In the autumn, another Entente offensive on the western front was decided upon. The French prepared to attack in Champagne and both French and British in Artois, the French from Neuville to north of Souchez, which large village was,
by this time, had almost level with the ground; the British from Haines to Loos—a far more ambitious effort than previous British trench-warfare operations. The main attack, however, was that in Champagne, Artois being only the scene of a diversion on a large scale.

The troops to be put in motion were Maistre's much-enduring XXI. Corps in front of Souchez, and on their right the XXXIII. Corps, now commanded by Fayolle, in front of La Folie. The French and German Higher Commands were the same, except that Maj. Gen. v. Kuhl was now chief-of-staff at Prince Rupprecht's headquarters.

Tactically, the operation was planned differently from that of May in that the attempt was made to crush the enemy by an intense bombardment prolonged throughout several days and that, therefore, no surprise could be hoped for. Objectives were to be strictly limited.

Accordingly on Sept. 20, with improved ground and air observation, and with guns and munitions available on a larger scale than ever before, there began a bombardment of the German works and rear areas, which continued day and night for five days. On the morning of the 25th the bombardment was intensified. At the same time the Germans began their counterpreparation and succeeded in inflicting some loss on the French infantry in their jumping-off trenches. The fine weather had turned to rain. At 25 minutes past 12 the infantry attack began. The spirit of the German infantry had been broken by the bombardment so that there was little or no resistance, what little there was being due to imperfect "mopping-up." Meanwhile, the German barrage had been laid down too late, and afterwards ignorance of the situation made their artillery afraid to fire. On the other hand, the rain and the muddy, shell-torn ground made the advance very slow. Not until 5:30 in the evening of Sept. 26 were the ruins of Souchez completely cleared and the line carried a quarter-mile to the eastward.

Meantime, unknown to the French, the German command was passing through a crisis of anxiety. Their reserves had not yet come up and the positions on Vimy ridge were almost without defenders and trains were run at short intervals on the Douai-Mericourt-Rouvray line to simulate the arrival of reinforcements. But the bad weather, the abominable terrain, and the French policy of limited objectives saved the situation for the Germans. On the 27th their reserves arrived and the situation was re-established. The action continued, but although the 28th saw the French lines advanced to include an important redoubt in front of Ginchy, the German front was no longer in danger of being broken, and after the 28th the French broke off the battle.

Early in 1916, British troops relieved the French in the sector, which had seen the longest, and (after Verdun) the most murderous battle of the entire war. The French are said to have had in Artois no less than 100,000 killed. The XXI. Corps alone, by Dec. 1915, lost 80,000 dead or wounded, 18,000 of whom fell in the six weeks from May 9 to June 20. (H. N.)

(C) NEUVE CHAPELLE.—The objects with which Sir John French attacked the German lines in March 1915 were to obtain a more favourable position for his share in the major operations to be undertaken in conjunction with the French. The fighting of Oct. and Nov. 1914 had left the British right between the La Bassee canal and Armentieres in an indifferent position tactically. After gaining a foothold on the ridge which runs S.W. from Lille past Aubers they had been thrust off into the more or less waterlogged low ground at its foot. To recover this ridge was essential if the German hold on the Lille-La Bassee line was to be effectively shaken and Sir John hoped, moreover, to stimulate his troops whose offensive spirit had found few outlets in the cramping conditions of trench warfare in a swamp. The point he selected for his attack was on the front held by Sir Douglas Haig's I. Army, where the Germans' capture of the village of Neuve Chapelle (Oct. 27, 1914) had driven a salient into the British lines. This portion of the British front had always been particularly difficult and costly to hold and a substantial success here might not only gain a footing on the Aubers ridge but render the German positions opposite Givenchy and Festubert untenable.

The attack delivered on March 10 by the 8th Div. (IV. Corps) on the left and the Meerut Div. (Indian Corps) on the right was successful in effecting a surprise. There had been no preliminary bombardment to give warning of the attack, for the ammunition supply only sufficed for 35 minutes' shelling, and to some extent the wire was cut except at the extreme ends of the line, stormed the positions with ease. The 25th Bde. of the 8th Div. carried Neuve Chapelle village and joined hands with the Gahrwal Bde., who had overrun the ground between the village and the cross-roads S. of it known as "Port Arthur." Many prisoners were taken, and it seemed that reinforcements had only to push on to achieve a substantial advance. Unfortunately, the stubborn resistance of the Germans at the ends of the line absorbed the attention of the troops in immediate support. On the left, S. of the ruined farm known as "The Moated Grange," the 2nd Middlesex were held up with wire as a fold of the enemy's forward line; on the right at Port Arthur a strong point held out for several hours, and was only carried when the 2nd Scaiths of the Dhrun Bde. reinforced the original assaulting parties of the Gahrwal Brigade. Similarly, it was not till well past midday, and after heavy fighting, that the 23rd Bde., improving the lodgment made by their right battalion, the 2nd Scottish Rifles, secured their second objective, and then only by utilizing two battalions of the 24th Bde. as well as their own supports, the 2nd Devons and 2nd West Yorkshires. Meanwhile the 27th Bde. had cleared Neuve Chapelle but found their left too exposed to allow any advance beyond the enemy's position. The orders important still, the orders had been explicit that the reserves were not to be put in without sanction from the Corps, and the extreme difficulty of maintaining communications with the advanced troops prevented divisional and corps headquarters from keeping in touch with the progress of the attack and delayed the advance of the reserves. Not till the afternoon was well advanced did the leading troops of the 7th Div. pass through the 8th, and though the 21st Bde. then cleared a substantial area N. of Neuve Chapelle and made some progress down the German trenches beyond the Moated Grange, German reinforcements in both men and guns made their presence felt, and advancing at a speed before the road running N.W. from the Moulin du Pâtre past Mauquissart had been crossed. On the right, meanwhile, two Gurkha battalions of the Dhrun Bde. pushed forward into the Bois de Biez, but their position was dangerously isolated and they had to be withdrawn E. of Rivière des Layes.

The chances of substantial progress on the second day, already diminished by the arrival of strong German reinforcements, were further reduced by weather conditions which made aerial direction of the British artillery fire impossible. This, combined with the interruption of telephone communications between the forward observing officers and their batteries, prevented the cooperation between artillery and infantry needed to reduce the numerous machine-gun posts furnished by the houses which studded the area N. of Neuve Chapelle. Groups of these, especially along the Moulin du Pâtre-Mauquissart road, proved most formidable obstacles. Moreover, the Germans, besides throwing in all the local reserves of their VII. Corps, together with the 6th Bavarian Res. Div. which was resting near Lille, brought up much additional artillery, so that the 7th and Lahore Divs. came under heavy fire and suffered severely in crossing ground in rear of the advanced troops sometimes without even reaching the front line. The 7th Div. met back counter-attacks and added considerably to
the tale of prisoners, but made no real progress; the 8th could do no more, but until the right of the 8th Div. could come forward to cover it the Indian Corps could not tackle the Bois de Biez.

On the next morning (March 12) violent counter-attacks against several points made it obvious that strong German reinforcements had been sent up. Approaching from the Bareilly Bde. along the Rue du Bois and against the rest of the Meerut Div. N. of Port Arthur, the Germans were mown down in numbers without ever reaching the British line. Opposite the Moulin du Pâtre another determined attack broke through the 24th Bde., to be thrown back by a prompt counter-stroke by the 1st Worcesters; and in this quarter also very heavy losses were inflicted on the Germans. Further N. again the 21st Bde. lost some advanced trenches, but successfully maintained its main position and lent effective aid to the 2nd Scots Guards and 2nd Borderers of the 20th Bde., who carried a strong redoubt N.E. of the Monted Grange and took 500 prisoners of the VII. Corps. But still the Moulin du Pâtre-Mauquissart road barred any advance, and the machine-guns in the fortified houses held up all attempts to get forward. Thus, though the 25th Bde. repulsed several attacks they could not carry the line forward from Neuve Chapelle; the 3rd Bde. (Lahore Div.) made a little ground and took prisoners but could not cross the Rivière des Laces; and now that all advantages of surprise had gone Sir John French saw that little was to be gained by pressing the attack. March 13 therefore saw the fighting much diminished in intensity; gains were consolidated and the troops reorganized, but the attack was suspended. The battle of Neuve Chapelle ended therefore somewhat disappointingly. The substantial advance which had at one moment seemed within reach had not been realized: the delay in pushing the British reserves had allowed the Germans to rush to the danger spot reinforcements sufficient to bar the road to the high ground of the Auber ridge. Thus while the tactical position round Neuve Chapelle was much improved the strategical situation was unchanged. The losses, over 4,200 in the Indian Corps, nearly double that in the IV., had been heavy, while of three minor operations undertaken as diversions those at Givenchy (I. Corps) and Wytschaete (II. Corps) failed, only the III. Corps proving successful against I'Epipetive (S.E. of Armentières). Still, it would be wrong to class Neuve Chapelle among British defeats. The troops were undoubtedly encouraged by seeing that German positions could be stormed and the captured ground held against powerful counter-attacks. Nearly 1,700 prisoners had been taken and the German losses had exceeded the British. Rifles, artillery and machine-guns had found splendid targets, and the German battalions who had shown themselves in the open had been shot down in masses. It was felt that another attack in which the lessons of the battle could be turned to good effect might lead to far-reaching results.

(D) AUVERS RIDGE AND FESTUBERT.—The part assigned to the British in the Allied offensive of May 1915 gave them as their immediate objective the S.W. end of the Aubers ridge. The IV. Corps was to attack at Rougébanx, N.E. of Neuve Chapelle, using the 8th Div. in the first assault and supporting it with the 7th, while S.W. of Neuve Chapelle the Meerut Div. (Indian Corps) and the 1st Div. (I. Corps) attacked from the line of the Rue du Bois which joins the Estaires-La Bassée road at the Port Arthur cross-roads. It was hoped that these divisions pushing forward in an easterly direction would establish a strong line extending from the Bareilly Bde. N. through southward past Aubers. But whether successful or not in their immediate tasks, the British would materially assist the Allied operations if their attack diverted German guns and men from the crucial point N. of Arras where the French were attacking.

It was with the greatest confidence that the British forces looked forward to this attack. Neuve Chapelle had whetted their hopes; it was believed that at this second attempt the lessons of Neuve Chapelle would be turned to good effect, that the causes which had robbed that attack of greater success would be avoided, that the increased artillery and ammunition available would allow of a far more effective bombardment. Unfortunately, the delays in renewing the attack, due partly to weather conditions but even more to the insufficient ammunition supply, had given the Germans time to so strengthen their positions that only the heaviest artillery could produce any appreciable effects. In the German lines 30-40 feet in thickness and backed up by concrete, were proof against 18-pounders and afforded complete protection against anything short of a direct hit to the machine-guns placed in pits sited at the ground level which swept the "no-man's-land" with a grazing fire. It was only the bitter experiences of May 9 which revealed how very formidable the German defences had become and what an increase in battering-power would be needed to reduce them. The actual attack delivered early on May 9 met with modified success at Rougébanx, but with complete failure at Rue du Bois. Here the infantry found the enemy's trenches strongly manned; the machine-guns from their pits at the base of the parapets maintained a deadly fire; scarcely any of the assailants managed to reach the enemy's parapets, and the few who did get into the German lines were promptly overwhelmed. Moreover, the German artillery at once opened a heavy counter-bombardment, and the British supports and reserves, packed into crowded communication and assembly trenches, suffered severely, while the task of evacuating wounded and reorganizing the troops for a second assault proved extremely difficult. A second effort was, however, made by both the 1st and Meerut Divs. about 7 A.M., though without success; and when in the course of the afternoon the Bareilly Bde. of the Meerut Div. and the 1st Bde. of the 1st Div. were put in, the same result followed. A handful of the 1st Black Watch made a lodgment in the enemy's trenches, but so small a party was powerless and was speedily overwhelmed.

At Rougébanx the right brigade of the 8th Div., the 24th, failed except at one point to reach the enemy's trenches, and suffered very severe losses. On its left, however, the 2nd Rifle Bde. and 1st Royal Irish Rifles of the 25th Bde. captured a considerable frontage, and lodgments were also made by the 2nd Lincolnshires and the 13th (Kensington) London Regiment. However, consolidation proved exceedingly difficult. Machine-guns on the flanks, which could not be located or silenced, prevented the advance of reinforcements; efforts to dig communication trenches came under heavy shelling, and could not be completed before German counter-attacks, vigorously pressed and well supplied with bombs, drove back those assailants who had penetrated beyond the front trenches and gradually forced the survivors out of the positions they had captured. The Rifle Bde. held on longest, keeping the Germans at bay till after midnight, but before the 7th Div. could push a battalion across to relieve them a renewed counter-attack ousted them from the German trenches. The division's losses came to over 4,000, about the same as at Neuve Chapelle, but without the satisfaction of retaining any of the ground won at the first assault. The 1st Div. lost nearly 4,000 men, the Indian Corps had over 2,000 casualties, and the completeness of the failure was the more felt because of the high hopes so generally entertained.

However, though the French attacks had also fallen short of the success anticipated, they had gained some ground and were being continued. Sir John French therefore determined to renew his efforts to assist his allies, though on a less ambitious scale. North-east of the village of Festubert, the German lines ran northward from Givenchy turn N.E. at a sharp angle towards the Bois de Biez, making a salient which it was proposed to attack on two sides. On the night of May 15-16, therefore, the I. and Indian Corps renewed their attempt to advance from the Rue du Bois, using the Meerut and 2nd Divs., while the 7th Div., which had been transferred from the IV. to the I. Corps, attacked eastwardly from Festubert. The attack was preceded by an intermittent bombardment extending over several days, instead of the short but intensive bombardment employed on March 10 and May 9. Over a large part of the
front attacked the German wire was effectively cut, but opposite the Indian Corps the German parapets successfully defied the efforts of the British artillery and (on the left of the front attacked) the Meerut Div. and the left of the 2nd Div. failed to carry the hostile trenches. The rest of the 2nd Div. fared better; the 6th Bde. and part of the 7th stormed the front German line, and reinforced by their reserves began pushing on against the second line. At 3:15 A.M. on May 16 the 7th Div. attacked, while the Meerut Div. made a fresh attempt. Once again machine-guns sheltered behind Lille damaged parapets and shot down the Gahrwal Bde., and this failure affected the advance of the division, who had to establish a defensive flank on their left and to devote their main efforts to getting touch with the 2nd Div. whose attack had met with considerable success, especially in the centre, where the 2nd Scots Guards and 11th Bdes. made a successful advance deep into the German positions. On their right also the 2nd Queen’s, after a temporary check, had got well in, and while they pushed on towards La Quinque Rue a bombing attack down the German front line, S. of the point of entry, led to the clearing of 700 yd. and the capture of 200 prisoners. But casualties had been heavy, and on the left the stubborn resistance of a strong point held up the left of the 20th Bde., which exposed the flank of the most advanced parties. These, out of touch with their supports, were forced back by counter-attacks. Similarly, the progress of the 2nd Div. was retarded by the resistance of two fortified farms, Cour d’Avoué and Ferme du Bois. Until these strong points could be reduced substantial progress was impossible.

Next day (May 17) operations were continued, a special effort being made to close the gap between the 2nd and 7th Divs., after which it was hoped to push on towards Rue d’UOuvert and Chapelle St. Roch. The first of these objects was effected, after about 700 Germans in the angle between the two attacks had left their trenches, apparently intending to surrender, but had been shelled by their own guns and almost wiped out. But the Ferme du Bois held up the 2nd Div., which could only progress to some extent on its right. The 7th Div., started well and cleared the strong points which had checked the left of the 20th Bde., but could not get much further in the direction of Cour d’Avoué, while the efforts of the 2nd Bedfords and 4th Camerons to push on against Rue d’UOuvert were not in the end successful. On May 18 the 4th (Guards) Bde. attacked Cour d’Avoué from the W., but could not carry it, and Canadian infantry, who on that day began relieving the 7th Div., did not succeed in doing more than master an orchard which had been reached (but lost again) on May 16 by some of the 7th Division. By this time the Germans had brought up considerable reinforcements and many machine-guns, and as the ammunition available was nearly exhausted all chance of substantial success seemed gone. For another week, however, severe fighting continued between La Quinque Rue and Givenchy, the brunt falling on the Canadians and on the 47th (London) Div. who were holding the Givenchy sector. These operations resulted in the capture of several hundred yards of trenches, including two formidable strong points, and the repulse of several German counter-attacks, but by May 25 Sir John French found it necessary to call a halt. It was now clear that though the great French effort further S. had won much valuable ground it had failed to break the enemy’s line or to prove the decisive stroke that had been hoped for: the Allies had to resign themselves, therefore, to a suspension of active operations. Actually, it was not till the end of June that this became complete, and in the interval two minor attacks were made near Givenchy, one by the 7th and 51st (Highland Territorial) Divs., the other by the Canadians: neither, however, resulted in any appreciable gain of ground, and although on June 16 an attack by the 3rd Div., now in the V. Corps, carried some German trenches W. of the Bellewaarde ridge and improved the tactical situation in the Hooge neighbourhood, it did not lead to the recapture of Hooge and involved the assailants in heavy losses.

For three months therefore, the position on the British front was one of almost complete stagnation. The only events of real importance were the arrival of the long-expected “New Army” divisions, the first of which, the 9th (Scottish) Div., actually began its disembarkation at Boulogne on the day of the disastrous repulse at Fromelles and Vauquois. By the end of July eight of these divisions were in the country, and their presence permitted the formation of a III. Army, which took over from the French a line to the N. of the Somme between Arras and Albert. During this period there was of course intermittent activity on the British front, mainly in the Ypres salient. Here at the end of July the Germans, making use for the first time against the British of their Flammenwerfer (liquid-fire projectors), attacked and captured the right trenches of the 14th (New Army) Div. just S. of Hooge. The battle holding the trenches was overwhelmed, and a counter-attack next day was unsuccessful, but ten days later, however (Aug. 9), two British divisions of the 6th Div. were successful in getting through the German positions. The German position was carried on a front of 1,000 yd., and heavy losses were inflicted on them; they brought up large reinforcements and strove desperately but unsuccessfully to regain the ground, but the 6th Div. held firm, retaking the trenches lost in the Flammenwerfer attack with a small spur N. of the Menin road.

It gives some indication of the difference in scale between the war of 1914-18 and the greatest of the previous campaigns of the British army that the 1,600 casualties of the 6th Div. in this quite minor action exceeded by 50% the losses of Wellington’s army at BUSAN.

(E) LOOS.—If in the Allied offensive of Sept. 1915 the British army, as in May, played only a subsidiary part, its contribution far outstripped both in men and in materials the meagre preparations of May. A four days’ bombardment on a scale hitherto unprecedented preceded the attack, for which nine divisions were available as against the four of May 9; while six others contributed by undertaking diversions. The front attack extended over nearly 6 m., from S. of the mining village of Loos on the right to the La Bassée canal on the left. The line ran fairly straight from S. to N. for nearly 3 m., but then curved away in a N.W. direction towards Cuinchy, so that two of the three divisions of Sir Hubert Gough’s I. Corps on the left had to attack N.E., while the right, Sir Henry Rawlinson’s IV. Corps, was striking due east. Further, Gough’s left division, the 2nd, was to attack on both sides of the canal, the 5th Bde. from Givenchy-les-La Bassée, the 6th and 38th Bdes. from Cuinchy. The 5th Bde.’s attack was one of the operations intended to distract the enemy and divert his reserves, but the other brigades aimed at reaching Auchy and linking up near Haines with the left of the main attack. A defensive flank would thus be established, under cover of which and of a similar flank to be formed on Rawlinson’s extreme right by the 47th Div., the central divisions of the I. and IV. Corps with the XI. Corps in support and the cavalry in readiness behind, would, it was hoped, break through between Haines and Loos, reach the Deule canal at Port à Verdin and unite E. of Lens with Gen. Foch’s troops.

To improve the chances of success and introduce an element of surprise it had been decided to employ against the Germans their own device, gas. Elaborate preparations had been made for the use of this weapon, and on its expected effectiveness in surprising and demoralizing the defenders the highest hopes were based.

The operations to be undertaken as diversions were much more substantial in scale than those which had accompanied the Neuve Chapelle attack. The 19th Div., was to attack in the low ground E. of Festubert. North of Neuve Chapelle the Indian Corps, supported on the left by the 20th Div., was to assault the German salient at Mauquissart, the legacy of the Neuve Chapelle fighting. Further N. again the 8th Div. was to attack at Bridoux, while the principal diversion was that to be undertaken against Hooge and the Bellewaarde ridge on the Ypres front by the 3rd and 14th Divisions. These attacks were more than mere raids; they all aimed at definite tactical improvements in the local situations, but their primary object was to
prevent the transfer of reserves to the main point of attack. This object they achieved, even if they nowhere resulted in permanent gains of ground, for it was only by prompt and vigorous use of reserves and hard fighting that the Germans recovered their initial losses at Hooge, at Bricquy and at Mauquissart where the Indian Corps made a fine fight.

In the preliminary bombardment the field guns were employed to cut the wire, while the heavier guns battered the other defences. Considerable damage was inflicted both on the trenches and their garrisons, though in places deep dug-outs allowed the defenders to escape lightly. Most of the wire was effectively destroyed, but at several points folds of the ground concealed it from observation, and at two at least this had far-reaching effects, parts of the attack, which was delivered at 6:30 a.m. on Sept. 25, being held up by uncut wire. Moreover, the wind proved too weak to carry the gas forward quickly, and thus made it in places worse than useless. This was notably the experience of the 2nd Div. at Cuinchy, and its attack, though gallantly pressed, proved unsuccessful and costly. Better success attended the 6th Div. E. of the railway to Vermelles, though its left brigade, the 28th, found the wire practically intact and was repulsed with heavy losses, a second attack by the supporting battalions faring no better. The 26th Bde. had to assault the formidable and important Hohenzollern Redoubt, which protruded in front of the slag heaps and miners' cottages at "Fosse 8," S. of Auchy. With great gallantry and at a heavy cost the Highlanders carried the Redoubt and swept on over the German main line, clearing the cottages and slag heaps behind. Some of the supports were absorbed in securing this first objective, but the remainder pushed forward and established themselves just short of Haines in the Pekin trench, part of the German second line. With prompt support Haines might have been carried, but the 27th Bde. were much delayed by the returning wounded and German prisoners who crowded the communication trenches, and before its leading battalions could reach the front the opportunity had passed; German reserves had arrived. All the 9th Div. could attempt was to maintain its gains against the counter-attacks.

Opposite the 7th Div. the chief tactical feature was a group of quarries W. of Cité St. Elie. These were reached and taken by the 22nd Bde., but at a cost which left it too weak to carry its second objective, Cité St. Elie. The 20th Bde., however, penetrated much deeper into the German position, capturing eight guns, and reaching the cross-roads between Cité St. Elie and Hulluch. But it was out of touch with the 22nd Bde. on its left, and as the division's reserves, the 21st Bde., were partly absorbed in consolidating the quarries sufficient reinforcements were not forthcoming to carry the attack any farther. Thus despite its substantial initial success the advance of the I. Corps came to a standstill. The detachments which had established themselves in the German second line were scattered and isolated, and needed both reinforcements and artillery support. But information was scanty and slow to get back to headquarters and without accurate information artillery support was impossible; the immediate reserves had been used up, and as no more were forthcoming the opening could not be exploited.

On the left of the IV. Corps the 1st Div. had as its objective the line from Hulluch to Bois Hugo, N.E. of Loos. Its left brigade, the rst, was most successful: it stormed the front line and pushed on to Hulluch over several lines of trenches, capturing three guns. But here it found itself unsupported, for the 2d Bde., on its right, had been stopped by uncut wire several hundreds of yards long and its repeated assaults proved equally unsuccessful and costly. The reserves of the 1st Div. had, therefore, to be used against its first objective, and not till the afternoon were they able by crossing the German trenches on the flanks of the untenanted portion to compel its defenders to surrender. By the time, therefore, that the 2nd Bde. finally reached its objective at Bois Hugo the delay had had serious consequences: the 1st Bde. had already been forced back 500 yd. from Hulluch, and the left flank of the next division to the right, the 15th, had been in secure all day.

Nevertheless, the 15th Div. had achieved remarkable success. Attacking with the 46th Bde. on the left and the 44th on the right, it carried the German front line, swept on over a second trench system into Loos and through it, and pushed on over "Hill 70," E. of Loos, until brought up by the defences of Cité St. Laurent, one of the suburbs of Lens, and by a railway embankment further north. But their initial advance had carried the men beyond the reach of artillery support; most of the units had destroyed cohesion, and touch had been completely lost with the headquarter formations in rear. Moreover, though some of the 46th Bde. had reached and occupied Puits 14 bis, a mine S. of Bois Hugo, the 2nd Bde.'s failure had left the 15th exposed to counter-attacks from the N., and reserves which might have secured the advanced position had to be diverted to that flank. On its other flank, however, the 15th Div. had no cause for anxiety. The 47th (London) Div. had as its task the formation of a defensive flank from the S.E. of Loos back to the British front line. This task it had accomplished to the letter, capturing three guns and several hundred prisoners, and after consolidating all its objectives it maintained them against vigorous counter-attacks.

About noon, then, on Sept. 25 the prospects of a break-through seemed bright. If reserves could have been promptly pushed in, the arrival of German reinforcements might have been forestalled and the advanced troops not only supported but carried farther forward. Unluckily, neither Gough nor Rawlinson had reserves available, and at noon the leading troops of the XI. Corps were still 3 m. from the original German front line and had to thread their way forward through an area congested with transports and with traffic of every description. More guns meant larger ammunition columns, while additional machine-guns meant additional limbers, and the rapid expansion of the British army had not only meant increased impediments but had brought into staff posts many officers without staff training or experience. The congestion of the rearward areas was a serious handicap, but hardly to be wondered at.

By the time the leading units of the XI. Corps reached the front matters had already changed for the worse. At nearly every point German counter-attacks had thrust back the most advanced troops, and though the Germans had to pay heavily for their gains the fact that their reinforcements were arriving in strength was even more serious than the loss of ground. At Hill 70 in particular there had been desperate fighting, and only with great difficulty had the 15th Div. maintained a position on its western slopes, thanks largely to the initiative of a battalion commander who, arriving there after the advance had swept on over the crest, had promptly entrenched a position on which the remnants of the advanced troops were able to rally when the counter-attack drove them back. But now that the XI. Corps was up it was hoped to push on again next morning.

The plan for Sept. 26 was that the IV. Corps, reinforced by the 21st and 24th Divs., should renew the attack from Loos to Hulluch. As a preliminary portions of the 15th and 21st Divs. were to recover the crest of Hill 70. However, as their attack started the Germans began a series of heavy counter-attacks from Bois Hugo southward, and succeeded in driving out of Bois Hugo the brigade of the 21st Div. which had just relieved the 2nd Bde. there. Profiting by this they pressed in on the left flank of the 15th Div. and gradually forced it back. Further S. the efforts of the 43rd and 62nd Bdes. to carry Hill 70 were hardly successful, but they kept up the pace by a redoubt on the crest. Moreover, while the main attack was delivered it was mainly by enfilade machine-gun fire from Bois Hugo that the 24th Div. was repulsed and driven back. All efforts of the 21st Div. to recover Bois Hugo failed; the 15th Div. could effect nothing by itself, and it was largely the possession of Bois Hugo and of Puits 14 bis which finally enabled the Germans to thrust the defenders of Hill 70 down the hill in upon Loos. That village, however, was secured by the arrival of the 6th Cav. Bde., and N. of Bois Hugo the Germans did not attempt to advance beyond the La Bassée road.
To the I. Corps also Sept. 26 had brought disappointment. Shortly before midnight (Sept. 25-26) a German attack broke through at the junction between the 7th and 9th Divs. and penetrated into the quaries, which passed back into German hands, the left of the 7th Div., recording to the old German support trenches. On its right the 7th Div. maintained all but its most advanced positions, and linked up with the Ist in front of Hulluch, but two attempts to recover the quaries failed. At Fosse 8 the 73rd Bde. of the 24th Div. (which had relieved the 26th Bde.) had great difficulty in holding its ground against counter-attacks. Fosse Alley, however, the intermediate line between the front system and Haisnes, which had been evacuated when the quaries were lost, was reoccupied and held by the 27th Bde., and the Germans had to pay highly for such ground as they regained. But they had now brought up several fresh divisions, and pressed their attacks hard, especially against the inexperienced 73rd Brigade. Before midday on Sept. 27 these troops, short of ammunition, food and water, and quite unable to reply effectively to the German bombers, were driven out of their positions. A dashing advance by the remnants of the 26th Bde., prevented the loss of the Hohenzollern, which had seemed imminent, but the recapture of Fosse 8 and the dump made Fosse Alley untenable and compelled its evacuation. Against the 7th Div., however, the Germans were less successful, and Sept. 27 saw the right of the position of the I. Corps fairly satisfactorily consolidated.

While the I. Corps had been defending its gains, the IV. had beenSituated to make more. During the night of Sept. 26-27 the Guards Div. had relieved the 21st and 24th opposite Hulluch and Bois Hugo. On the afternoon of the 27th its 2nd Bde. attacked Bois Hugo and Puits 14 bis, while its 3rd advanced through Loos against Hill 70. Both attacks were splendidly pressed and achieved valuable gains. Chalk Pit Wood was reached and secured, though Puits 14 bis could not be held against heavy counter-attacks, and a line was established just W. of the La Bassée road to link up with the 1st Div. opposite Hulluch. Similarly the 3rd Guards Bde. put Loos out of danger of recapture by making good a line just below the crest of Hill 70.

By the evening of Sept. 27 all hopes of a speedy and decisive success were gone. No break-through had been achieved, and Gen. Foch’s attack also had been checked. Still the vigour with which the Germans hurled counter-attack after counter-attack at the positions taken from them testified to the value they attached to them. The fighting was fiercest round the Hohenzollern Redoubt, which the 28th Div. took over from the 9th on Sept. 28 and held under considerable difficulties till Oct. 3, when a specially violent attack drove them from its ruins, though even then they retained a substantial portion of the 9th Div. position. On Oct. 5 the Guards Division cleared the 28th Div., and during the next week made several minor gains by bombing-attacks. Fighting was also heavy without producing any marked change in the tactical situation round the quaries on the frontage held in succession by the 7th, 2nd and 12th Divisions. From the Vermelles-Hulluch road to Loos the Germans were less aggressive, their only serious effort on this front being on Oct. 8, when they attacked in great force, only to be repulsed with very heavy losses especially by the Ist Div. at Chalk Pit Wood and by the French, who had taken over Loos itself on Sept. 30.

After this repulse the Germans made no more big counter-attacks. By recovering the dump and Fosse 8 they had won back observation posts which overlooked much of the salient which the battle had produced. Sir John Foch was naturally loth to abandon the effort to recover them, and decided to bring up the 46th (North Midland) Div. for a fresh attack on the Hohenzollern Redoubt, while simultaneously the 12th and 1st Divs. should attack the quaries and Hulluch. The attack, delivered on Oct. 13, was only partially successful, but did result after heavy fighting in the recovery and retention of the bulk of the redoubt. The 12th Div. failed to retake the quaries, but made useful gains which improved its line. The 1st Div., however, once again found Hulluch too much for it, so that the net result of the attack did not encourage a repetition, and with this major operations in the battle area ended. The French continued attacking in Champagne for some weeks, though even there all prospect of decisive success was gone, while in Artois they had already abandoned their offensive.

When the results of the British offensive are set against the high hopes entertained before the attack it is excusable to write it down as a failure. The gain of ground was not worth the 50 to 60 thousand casualties incurred in its capture, but the German losses on the British front were almost as heavy, and the capture of over 20 guns and 3,000 prisoners was no small encouragement. It had been shown that the Germans could be driven from positions they believed impregnable. Moreover, valuable experience had been gained not only in the use of the new weapon, gas, but in staff work, in administrative arrangements and in tactics, experience which was to be built upon in 1916. At Loos an effort had been made to apply the lessons of Neuve Chapelle. It was partly because Neuve Chapelle had shown the dangers of retaining too close a hold on the immediate reserves that it had been arranged that the troops (immediate reserves included) were to press forward without limitation. Loos showed the advantages of the “limited objective” and of dealing with untaken portions of a hostile line rather by outflanking them than by renewing direct attacks; it also showed that the patterns of grenades in use in the British army were too varied and mostly unsuitable for wet weather, with other lessons major and minor. It is easy in the light of the experience gained at and after Loos to criticize the whole plan as too ambitious for the resources, human and material, at the commander-in-chief’s disposal; to point out the unwisdom of employing raw troops in a great battle within a fortnight of their landing in France; to argue that, had the frontage been narrower and the divisions disposed in greater depth, more immediate reserves would have been available. Still the balance remains on the side of gain. Loos inflicted heavy losses on the Germans; it was a foretaste of heavier losses in store for them. The performances of the 9th, 12th and 15th Divs. showed that the improvised “New Armies” of Britain were likely to prove a factor of decisive importance in the war.

(C. T. A.)

(P) The German Retreat to the Hindenburg Line, 1917.—In order to follow intelligently the operations which took place during the early part of 1917 it is necessary to understand thoroughly the situation which had arisen and the general atmosphere which had been created as a result of the prolonged fighting on the Somme. In Dec. 1916 Gen. Nivelle was appointed to the chief command of the French forces. He declared great confidence in his ability to break through the enemy’s lines and achieve a mighty blow, specified points and, immediately disclosed his project to the British commander-in-chief, Sir Douglas Haig. The plan was briefly as follows: (a) to deliver the main attack by three French armies on the AISNE front—one of these armies to be in reserve for purposes of exploitation; (b) to deliver a subsidiary attack by the British army on the Arras front; (c) to undertake minor actions between Reims and Arras to contain the enemy; (d) vigorous exploitation. In order to give effect to these proposals and to enable the French to undertake the major operations with large reserves, Gen. Nivelle’s plan included the relief of French troops by the British as they were needed on the Somme front. The weakness of this plan, apart from the Russian revolution and release of German reserves, which could not be foreseen, lay in the imposition of the major task on the French armies, already exhausted by two years of heavy fighting and the strain of the defence of Verdun, while the British, at the height of their strength and vigour, instead of being trained and concentrated for a vigorous blow, were relegated to defensive work and the minor rôle. These operations were to take place as early as possible, and it was hoped that the respective attacks would be launched early in April. The Somme battles had evidently shaken the enemy seriously, and had caused his defensive front
in the neighbourhood of the Ancre to become a pronounced and
dangerous salient. Moreover, it was known that he was con-
structing a rearward line of defence, subsequently known as the
Hindenburg Line, which would materially shorten his defensive
front and thus release a number of divisions which could be
moved into reserve.

Such was the position of affairs on Jan. 1 1917. The main-
tenance of pressure on the enemy on the Ancre-Somme battle-
front was now of immediate importance. Signs were not lack-
ing that the enemy had considerably weakened, and his posi-
tion in the Ancre salient was vulnerable and dangerous. After
a period of bad weather it became possible during Jan., to under-
take minor and local operations, which resulted in the capture
of the Beaumont Hamel spur, thus opening up a wide field of
view and observation for artillery fire. No time was lost in
making use of this advantage. Feb., which carried the British front forward on the N.
bank of the river. This assisted towards the capture of a point
on the S. bank, which gave observation into the upper valley
of the Ancre and over the German gun positions. These hostile
batteries which protected the Serre salient were forced to with-
draw, thus weakening to a dangerous degree the German de-
fences to the north. It was now possible to attack with advan-
tage the Serre-Beauergard and Courcellet-Miraumont ridges,
the possession of which, besides turning the German defences
on the N. in the neighbourhood of Gommecourt and Monchy,
would open up a further field of view up the valley of the Ancre,
where many hostile batteries had been located. In order to
gain this position an assault was delivered on the morning of
Feb. 17 by the 2nd, 15th and 63rd Divs., on both banks of the
stream. On the N. bank the attack was completely successful,
while on the S. bank considerable resistance was encountered.
Nevertheless, the whole position was occupied shortly after-
wards, and small detachments and patrols working forward
succeeded in occupying the enemy's defences on a wide front
from opposite Gueudecourt to Serre, including the villages of
WKencourt and Miraumont as well as the Beauergard spur.

It had become increasingly evident that the German defence
was weakening, and their troops were being gradually with-
drawn, the first indications being on a narrow front in the valley
of the Ancre, but now on a more considerable scale. The pro-
longed period of exceptional frost following on a wet autumn
had frozen the ground to a great depth. The thaw, however,
began in the third week of Feb.; the roads, disintegrated by the
frost, now broke up, and the area of the 1916 battlefield became
a quagmire. On the other hand the conditions of the weather
favoured the defenders, who fell back on to fresh unbroken
ground, and the succession of misty days covered their move-
ments.

Notwithstanding these difficulties the British and Australian
troops kept up constant pressure, and by the delivery of minor
attacks drove the enemy from position to position, until by the
end of Feb. the whole of the Ancre valley and the higher ground
to the N., including the village of Gommecourt, fell into their
hands. The enemy had now evidently fallen back into a pre-
viously prepared line of defence—the trench system known as
the Le Transloy-Loup part line, cutting off the Ancre salient and
covering the villages of Le Transloy, Grévillers, Achiet-le-
Petit and Bucquoy. It was possible that he would make a
stand on this defensive line. If not, undoubtedly his with-
drawal would be conducted on a more comprehensive scale
altogether and on a wider front.

Owing to the heavy work required to be executed in render-
ing the roads passable, and moving forward guns, ammunition
and supplies, in addition to the necessity for gaining ground to
within assaulting distance of this defensive system, a delay of a
week occurred before operations of a more serious character
could be undertaken. On March 11 and 12 the Le Transloy-
Loup part line was subjected to so effective a bombardment that
on the morning of the 13th the enemy abandoned this strong
position. Grévillers and Loppart wood were immediately
occupied, and preparations put in hand to attack the enemy's
next line of defence, which covered Bapaume and Achiet-le-Grand.

For some time prior to this date indications had been ob-
erved of a further and wider extension of the German with-
drawal. It had been ascertained that the Germans were pre-
paring with feverish haste a new and powerful defensive sys-
tem in the Hindenburg Line, which, branching off from the orig-
inal defences near Arras, ran S. E. for 12 m. to Quéant and thence
passed W. of Cambrai in the direction of St. Quentin.
The immediate object appeared to be to escape from the salient
between Arras and Le Transloy, but it was also evident from
the preparations the Germans were making on a grand scale,
that they contemplated an eventual evacuation of the greater
salient between Arras and the Aisne valley N.W. of Reims.
The withdrawal to the Hindenburg defences would cause a very
considerable contraction in the length of the line, with a con-
sequent increase of the German reserves. It was evident that
the Somme battles of 1916 had materially reduced his strength,
and with the expected onslaughts on the western front, coupled
with a Russian offensive on a grand scale, it was necessary for
them to contract the front and conserve their strength.

Constant watch had accordingly been kept by the British
along the whole front S. of Arras, strong patrols, kept alert and
active, pushing forward here and there, with the result that St.
Pierre Vast wood was occupied on March 16. Meanwhile
information was received which indicated the reduction of the
enemy's forces S. of the Somme, and pointed to the probability
that his line in that sector was being held by rear-guard detach-
ments supported by machine-guns, whose withdrawal might be
expected at any moment.

It was evident that the enemy was withdrawing according to a
carefully prepared plan along the entire front of recent opera-
tions and on both banks of the river Somme. Orders were
accordingly given by the British G.H.Q., in conjunction with
the French, for a general advance on the morning of March 17.
Except at certain localities where detachments of infantry and
machine-guns had been left to cover his retreat, there was little
serious resistance to the advance, and that resistance was
rapidly overcome.

On March 17 Chaunel was captured by the 61st Div. and
Le Grandcourt by the 2nd Australian Div., while further to the right
the French entered Roye. On the following and subsequent
days the advance continued, and the whole intricate system of
German defences in this area, consisting of many miles of power-
ful well-wired trenches which had been constructed with im-
mense labour, passed into the hands of the Allies.

On March 18 the British 45th Div. gained the important
tactical position of Péronne, and Mont St. Quentin which lies
above it. The possession of this locality at the angle of the
Somme showed clearly that the enemy would not stand on the
line of the river, for it obliterated, that line to the south. The
bridges over the Somme, which had been systematically de-
stroyed, were temporarily and partially repaired with great
rapidity, and the British troops, passing over, deployed into
open country with patrols and cavalry thrown forward.

By this time the Allies' advance had reached a stage at which
the increasing difficulty of maintaining the communications
rendered it imperative to slacken the pace of the movement.
Not only had the bridges over the river Somme been destroyed,
and the roads rendered almost impassable both artificially and
from the weather, but the wide belt of devastated ground over
which the Somme battle had been fought offered immense
difficulties to the passage of guns and transport. Moreover, in

ARTOIS, BATTLES IN

275
front lay an enemy whose armies were capable of launching a vigorous counter-offensive. Strong detachments of his infantry and cavalry occupied tactical points along the line of advance, serving to keep the enemy supplied with information and as a screen to his own movements. His guns, which had already been withdrawn to previously prepared positions, were available at any moment to cover and support a sudden counter-stroke, while the conditions of the country across which the Allies were moving made the progress of their own artillery unavoidably slow. The bulk of the enemy’s forces were known to be occupying a very formidable defensive system, upon which he could fal back should his counter-stroke fail. On the other hand the Allies, as they moved forward, faced all prepared defences farther and farther behind them. In such circumstances the necessity for caution was absolute. In order to combat these various difficulties, the Allies were thought to spend, at the various stages of the advance, to select and put into a state of defence successive lines of resistance, which the main bodies would occupy, and in which they could give battle in the event of a hostile riposte. Meanwhile advanced guards, patrols and reconnoitring detachments pushed ahead and maintained touch with the enemy, and roads, railways, bridges, telegraphs and telephones were constructed or restored with rapidity.

As the Allies approached the Hindenburg Line, the resistance of the enemy stiffened and the fighting for the various tactical localities became more severe. During the first week in April the British had almost reached the Hindenburg Line, and had gained possession of the villages of Lempire, Epehy, Metz-en-Couture, Lagnecourt, Noreuil, Croisilles, Hénin-sur-Cojeul and Bézens. The enemy was now withdrawn to his great defensive line, which he had taken months to prepare, shortening his front considerably and enabling him to bring several divisions into reserve. He had in front of him a devastated zone where the mounting of an Allied attack would present extreme difficulties, thereby releasing yet other troops from the guard of the trenches to pass into reserve.

(2) BATTLE OF ARRAS (April-May 1917).—At the close of 1916, and before the appointment of Gen. Nivelle to the command of the French forces, a general plan had been agreed upon by all the Allies to conduct a simultaneous offensive on all fronts. The British part in this offensive was to consist of a double attack along the Scarpe and Ancre valleys, to cut off the Gommecourt salient created as a result of the Somme fighting. The V. Army was to attack along the Ancre, the III. Army was to debouch from Arras along the Scarpe, while the I. Army (Canadian Corps) was to secure the left flank of these operations by seizing the Vimy ridge. Owing to the exhaustion of the French armies the main operations were to be conducted by the British, who would not press the attack unduly in the direction of Cambrai, but be prepared to switch rapidly to the N. and undertake further operations of greater dimensions in Flanders.

The appointment of Gen. Nivelle in Dec. 1916 to the chief command of the French, and the acceptance of his plan of offensive, dislocated the strategical plans for the British armies at this particular juncture. The Nivelle plan gave the French the major rôle, as indicated earlier, namely, that of delivering a decisive blow from the Aisne front, while the British operations in Artois were to be of a subsidiary character. It is to be noted in this connexion that the extension of the front in relief of the French caused a reduction of power to the British which materially affected their operations throughout the remaining of the year. The Nivelle plan relied on the success of the main offensive by the French, but if that failed the subsequent operations would be seriously handicapped. This was a matter of first-class importance, seeing that the French had already been overstrained while the British were reaching the height of their strength and efficiency. Apart from this, the actual tactical scheme and dispositions required little modification as a result of the acceptance of the Nivelle plan.

General Nivelle did not altogether approve of the plan of the British commander-in-chief, and urged that the attack on the Vimy heights should be abandoned and that the concentration should be effected farther S. on the Arras–Ancre front, pointing out that the inclusion of Vimy would cause too wide an extension and dissipation of force. This point is of some interest as showing the difficulties which a commander has to face in the selection of his front of attack and objectives. Sir Douglas Haig had, however, given the closest attention to the various factors affecting the situation, and refused to give way. His arguments were mainly two: firstly, that the capture of the Vimy ridge was essential to secure the left of his operations, and secondly, that any attack mounted S. of Arras, and S. of the point where the Hindenburg Line hinged on the main German front, would be delivered into a pocket or would be entirely dislodged by a voluntary withdrawal of the enemy from the Gommecourt salient, whereas the German forces were bound to adopt the same tactics in the light of experience. The British commander-in-chief scented the retreat of the Germans to the Hindenburg Line and laid his plans to meet that eventuality. The result was that even after the German retreat little or no alteration was necessary. Had he, however, given way to the pressure placed upon him and mounted his attack from Arras to Gommecourt, the operation, which was required by Gen. Nivelle to draw in the hostile reserves and pave the way for the main French attack on the Aisne, could not have taken place at all.

The task of the British was to attract as large forces of the enemy as possible and so reduce the opposition to the French. As soon as the German retreat developed, all those troops and heavy artillery which were not required with the V. Army in its advance from the Ancre were diverted to the III. and I. Armies in order to strengthen their attacks to the utmost.

The preparations for a great offensive, where reliance is placed on artillery to destroy the enemy’s defences and reduce his fire-power to such a point as to enable a successful advance to be made, are extremely long and arduous. When transport requirements on the Arras front were first brought under consideration, the neighbourhood was served by two single lines of railway leading to Arras, the combined capacity of which was less than half the requirements. Considerable constructional work, therefore, both of standard- and narrow-gauge railway, had to be undertaken to meet the programme. Roads had to be improved and adapted; new roads had to be constructed, and material massed forward for construction across the enemy’s defences as soon as the troops advanced. For this latter purpose use was made both in this and in later offensives of plank roads. These were built chiefly of heavy beech slabs laid side by side, and were found to be of great utility, being capable of rapid construction over almost any nature of ground. By these means the accumulation of the vast stocks of munitions and stores of all kinds required for the offensive, and the disposal of the troops, were made possible. Hutting and other accommodation for the troops concentrated in the area had to be provided in great quantity; an adequate water-supply had to be guaranteed. Very extensive mining and tunnelling operations were also carried out. In particular, advantage was taken of the existence of a large system of underground quarries and cellars in Arras and its suburbs to provide safe quarters for a great number of troops. Electric light was installed in these caves and cellars, which were linked together by tunnels, and the whole connected by long subways with the trench systems E. and W. of the town.

A problem peculiar to the launching of a great offensive from a town arose from the difficulty of ensuring the punctual debouching of troops and the avoidance of confusion and congestion in the streets both before the assault and during the progress of the battle. This problem was met by the most careful and complete organization of routes.

Practically the labour of the whole of the troops was required to carry through all this work, and while this immense task was proceeding, the British IV. and V. Armies were vigorously pursuing the enemy to the Hindenburg Line, and the French in process of being relieved as far S. as the Amiens-Roye road. All this placed a heavy strain on the British troops.
Meanwhile, during the first three months of 1917, negotiations of fundamental importance were proceeding between the high commands and the Governments of France and Great Britain, touching on the principle of unity of command. General Nivelle desired to secure the command of all the forces involved, both British and French. Certain differences of opinion early declared themselves between the British and French commander-in-chief. These were chiefly in the first instance in connexion with the date of attack, and the extent to which the French troops in front line should be relieved. The transportation service and the Nord railway were not equal to the work of operations on so great a scale as at this early date as that proposed by Nivelle; and in view of the fact that the British commander-in-chief desired to give his troops some rest and training and was somewhat sceptical as to the degree of success which would be attained by the French, was desirous of limiting the extension of his front to the Amiens-Villers Bretonneux line. Accordingly an agreement on Jan. 1 that the attack should take place as early as possible, and that the French should be relieved as far as the above road by the end of Jan., did not satisfy Gen. Nivelle; the latter referred the whole question to his Government and, indirectly, to the British War Cabinet, with the result that a Cabinet meeting was held in London on Jan. 15 at which both Sir D. Haig and Gen. Nivelle were present. The conclusions arrived at were as follows: (a) The British to relieve the French forces as far S. as the Amiens-Roye road, relief to be completed by March 1; (b) the offensive to commence on April 7 at latest; (c) vigorous exploitation to be undertaken by all French and British, if necessary. The French troops in front line were accordingly relieved to the Amiens-Roye road, and preparations pushed forward to deliver the attack at the earliest possible date. But the transport difficulties had become so acute that, notwithstanding the fact that every available British soldier was utilized for railway construction and other work, a serious breakdown in the Nord railway system appeared to be inevitable, and the matter had to be referred to the French Government with a view to obtaining greater facilities. Further negotiations in regard to the problem of command took place secretly between the British and French Governments, and materialized in the Calais conference on Feb. 26 and 27, 1917. This conference had originally been summoned to discuss the question of transportation. There were present: M. Briand (premier), Gen. Lyauty (Minister of War), Gen. Nivelle (French C-in-C), Mr. Lloyd George (British Prime Minister), Gen. Robertson (C.G.S.), Sir D. Haig (British C-in-C), Gen. Kiggell (C.G.S.). A scheme was set before the conference by the French Government for the establishment of an Allied G.H.Q. and the appointment of a French generalissimo, and the breaking up of the British divisions to form an “amalgam” with the French troops. General Robertson and Sir D. Haig were in complete ignorance of this proposal until the amalgamated scheme was produced; the British Prime Minister, however, while opposing the French proposal to break up the British army and form an “amalgam” with French brigades, directed these two officers to draw up a scheme of command, by which the control of operations in the coming battle would be solely in Gen. Nivelle’s hands, and the British army under his orders. This was the decision of the War Cabinet. The scheme was accordingly drawn up in the course of the morning of Tuesday Feb. 27, so that when the conference met at 11.30 a.m. on that day, discussion was limited to questions of detail. Finally the French War Committee and the British War Cabinet agreed to the following arrangements:—

1. The British War Cabinet recognizes that the general direction of the campaign shall be in the hands of the French commander-in-chief.
2. The British commander-in-chief to conform his plans to those of the French during the preparation and progress of the projected campaign.
3. Within the limits of (2) the British commander-in-chief will be entitled to utilize his own resources and forces in the manner which he considers most desirable.
4. In regard to (2) an exception will be made in a case where he considers that such action would endanger the safety of the army or prejudice its success; in that case a report shall be made, together with the reasons, for the information of the War Cabinet.

As all students of war agree, within the army of a combatant nation, unity of control is essential to secure the most effective execution of military operations. In theory, it is equally desirable in all circumstances. There is, however, a difficulty inherent in applying the principle of unity of control to Allied nations. This difficulty lies in the incidence of responsibility. For example, if the British armies are placed under the command of a French general, the British commander cannot be held responsible to the nation. The responsibility for the British armies cannot devolve on the French commander, and must therefore devolve on the British Government. At the Calais conference, however, an effort was made by the British War Cabinet to make the field-marshal commanding the British forces retain responsibility by instructing him to conform his preparations to the views of the French commander, except in so far as he considered that this would endanger the safety of the army or prejudice the success of its operations.

The battle of Arras was the first occasion on which the experiment was tried of securing a form of unity of command, and after the conference of Calais the British forces to be engaged in the battle were placed, within the limitations noted above, under the general control of Nivelle. Certain differences of opinion, however, still existed, and the whole question was again referred to the Governments, with the result that the two commanders-in-chief and two Cabinets met in London on March 17 in order to define the position more clearly.

During the month of March, as previously narrated, the Germans continued to withdraw to the already prepared Hindenburg Line, followed up and pressed by British troops, until early in April they were established in positions covering that line. On the British side, the extensive preparations necessary were pushed ahead as quickly as possible and so far as the available transport facilities permitted. The general plan agreed upon was that the British attack should be launched as early as possible in April and that the French main attack on the Aisne should follow two or three days later. This was to permit and induce the German reserves to be drawn into the British battle and towards the British front, and thus enable the main attack by the French to be delivered with greater prospects of success and exploitation. The British actually launched their assault on April 9, but for reasons of unfavourable weather the French postponed their attack until April 16. Prior to the offensive the new German lines of defence on the British front ran in a general north-westerly direction from St. Quentin to the village of Tilloy-les-Mollaines just S.E. of Arras. Thence the German original trench systems continued northwards across the valley of the Scarpe to the Vimy ridge which, rising to a height of 475 ft., dominates the country eastwards. The front attacked by the III. and I. Armies on the morning of April 9 extended from just N. of the village of Croisilles, S.E. of Arras, to just S. of Givenchy-en-Gohelle at the northern foot of the Vimy ridge, a front of nearly 15 miles. The enemy’s defences comprised the normal powerful defensive front consisting of three separate and heavily wired trench systems, and in addition, from 3 to 5 m. further E. a new defensive system, known as the Hoei—Quéant line, which in fact was a northerly extension of the Hindenburg Line, branching from that line at Quéant.

The great strength of these defences demanded very thorough artillery preparation, and this in turn could only be carried out effectively with the aid of the air service. A greater mass of artillery, both guns and howitzers, was used for preparation in proportion to the front engaged than had yet been available in any previous British attack. Three weeks prior to the attack the systematic cutting of the enemy’s wire was commenced, while the heavy artillery searched the enemy’s back areas and communications. Night firing, wire cutting and bombardment of hostile trenches, strong points and billets continued steadily
and with increasing intensity on the whole battle-front till a few days before the assault when the general bombardment was opened. During this latter period extensive gas discharges were carried out, and frequent raids undertaken by day and night along the whole front of attack.

Aircraft were incessantly at work during the whole of this time not only in air fighting and directing the artillery fire, but also in photographing the enemy's defences so as to ascertain the extent of damage effected and the best means of approach for the infantry. Much information and intelligence was gleaned from these photographs as to the progress of the preparation, and from the raids as to the condition of the enemy, and any modifications in regard to his method of holding his defences.

The general object of the attack was to engage and absorb the maximum number of hostile troops; the general plan was to secure the heights of the failed of Monchy-le-Preux and the Vimy ridge and to bring the V. Army into effective operation on the southern flank of the battle; the general method of attack was a succession of comparatively short and delicate advances, the separate stages of which were arranged to correspond approximately with the enemy's successive trench systems. As each stage was reached a short pause was to take place according to a prepared time-table to enable the troops detailed for the attack on the next objective to form up for the assault.

Tanks were allotted to each corps for specific tasks, such as the capture of the powerful redoubts of Telegraph Hill and the Harp (Jut St. of Feuchy-les-Mofflaines) and Railway Triangle, a stronghold formed by the junction of the Lens and Douai railway lines E. of Arras. The whole scheme of attack along the entire 15 mile front was carefully co-ordinated. A special feature in the operation was the debouching of the troops to the assault directly from the town of Arras, the subterranean passages and caves of which had been prepared so as to harbour the reserve troops and enable them to pass protected to the trench systems, and so to the assault.

The troops engaged in the attack were as follows (from S. to N.): III. Army (Gen. Sir E. H. H. Allenby), VII. Corps (21st, 30th, 56th and 1st Divs.), VIII. Corps (3rd, 9th, 15th, and 37th Divs.), XVII. Corps (3rd, 4th, 5th, and 51st Divs.), I. Army (Gen. Sir H. S. Horne), Canadian Corps (1st, 2nd, 3rd, and 4th Canadian Divs., and 12th Bde. (5th British Division). In all there were 17 divisions, with 980 heavy guns and 1,800 field pieces. In addition the Cavalry Corps was brought forward behind the III. Army, in case the development of the battle should give rise to an opportunity for the employment of mounted troops.

The general attack on April 9 was launched at 5.30 a.m. under cover of a heavy and effective artillery barrage; the infantry advanced everywhere, and within 40 minutes the whole of the German first line system had been stormed and captured except at the northern extremity of the Vimy ridge. At 7.50 a.m. the advance was resumed according to programme; more severe fighting took place in view of the greater opposition encountered. Several strong points and localities were stubbornly held by the enemy, but by 12 noon the whole of these and all the second objectives with the exception of the railway triangle had fallen, from Neuville Vitasie as far N. as La Folie farm. As always happens in such a battle, the enemy's troops managed to retain certain tactical localities. Meanwhile the artillery was brought forward to support the attack on the third objectives. Owing to the long range the wire in front of the enemy's third trench system had not been effectively cut in many places; nevertheless good progress was made, and many batteries were captured.

The battle now inevitably became more ragged, owing to the increasing opposition and to the local modifications of plan necessitated by the unexpected occurrences inseparable from the battlefront. South of the Scarpe, St. Martin and Feuchy Chapel on the Arras-Cambrai road were captured. In the Scarpe valley the 15th Scottish Div. after a long struggle stormed the railway triangle, and moving rapidly forward captured the village of Feuchy. The 37th Div., hitherto in reserve, whose rôle it was to pass through the first-line troops to the assault of the high ground and village of Monchy-le-Preux, endeavoured to widen the breach made in the enemy's third line of defence in order to carry out its task, but was held up by the wire. South of the Scarpe, the enemy's third line had been captured in places, but he still retained possession of the greater portion of it, together with the high ground in Orange Hill and Monchy-le-Preux. North of the Scarpe practically the whole of the day's programme was carried through. On the right the 4th Div. in reserve passed through the troops in front line, and according to plan captured the village of Fampoux, thus making a great breach in the enemy's third system of defence. In the centre the Canadian Corps stormed the Vimy heights, entrenched itself on the eastern slopes, and sent patrols out along the front. On the left the 4th Canadian Div., encountering violent opposition at Hill 145 on the northern extremity of the ridge, was compelled to postpone the attack till the following day.

The operations of April 9 had been eminently successful, in spite of heavy squalls of snow and rain; and large numbers of the enemy's troops and guns had been captured.

During the night of the 9th to 10th the 37th Div. made progress through the break in the German third line S. of the Scarpe, advancing to the northern slopes of Orange Hill; and on the morning of the 10th about noon the advance became general, the whole of the enemy's third line S. of the Scarpe being reduced, and the 37th Div. reached the north-western edge of Monchy-le-Preux. A great struggle then centred round this village, and all efforts of the infantry to seize it directly, and of the cavalry to pass around either flank of it, failed, chiefly owing to the lack of effective artillery support due to the long range and the rapidity of the advance. On the morning of the 11th, however, assisted by tanks, the fight was resumed, and by 9 a.m. the village was captured, and subsequently many counter-attacks repulsed.

Meanwhile the Germans had been stubbornly defending the Cojeul valley and the Hindenburg defences at their junction with the old third line, a vital part of the front, where the open forward slopes, surmounting from end to end the enemy's machine-guns, rendered any advance extremely difficult. In this area an operation of a bold and hazardous character was undertaken on the morning of the 11th, which was nearly successful. At 4.30 a.m., in conjunction with an attack by the right of the III. Army on Hemnil and Wancourt, the V. Army (4th Australian and 62nd Div.), assisted by tanks, made a gallant effort to breach the Hindenburg Line in the neighbourhood of Bullecourt. The execution of the attack, being over a wide extent of open country, was exceedingly difficult; Australian troops, however, penetrated as far as Riencourt-lez-Cagnicourt and the 62nd Div. reached Bullecourt, but owing to the dense opposition and the failure of the attacks by the right of the III. Army these positions could not be maintained. Had both attacks been successful and the two armies joined hands forward, a very wide breach in the enemy's defences in an important area of the battlefield would have been effected with far-reaching results. It was not till the morning of April 12 that the 21st and 50th Divs. succeeded in capturing Hemnil and Wancourt.

North of the Scarpe much fighting of an indeterminate nature took place at Roeux and the neighbourhood on this day, but at the extreme northern extremity of the battlefield the 4th Canadian Div. and 24th Div. secured the whole of the important positions on the flank of the Vimy ridge and aride the Souchez river at the "Timple" and "Bois en hache." The Germans now began to withdraw from the eastern slopes of the Vimy ridge, and British and Canadian patrols moved forward until by the evening of April 14 a line had been reached N. of the river Scarpe from Roeux to E. of Baillieu-Hirondelle Wood and Liévien to the old front line at the Double Crassier. On the right by the evening of the 14th the attacking troops had fought their way forward with great difficulty along the Hindenburg Line as far as Fontaine-les-Croisilles and Wancourt Tower, where farther N. many counter-attacks on Monchy-le-Preux were repulsed.
The main offensive by the III and V. Armies terminated on the 14th; the artillery support was becoming inadequate, and the troops in front line required relief. A remarkable success had been gained; the British front line had been moved forward some 4 m., and some 13,000 prisoners and 200 guns had been captured. It was not possible, however, to break off the battle, seeing that the French offensive was on the point of being launched, and it was important that the full pressure of the British operations should be maintained in order to assist it. Much had already been accomplished; the enemy had been compelled to pour men and guns into the breach, and a large hostile concentration in the battlefield was in process of being effected.

The only offensive action taken by the Germans during this period in this area occurred on April 15, when they attacked the British position in front of Loos, 1,250 from Hermies. An initial success, in which some of the British battery positions were overrun, was at once neutralized by a counterstroke which restored the line.

On April 16 the French launched their main offensive in the Aisne. The decisive results which had been looked for were not achieved; there was no rapid break through or exploitation by a reserve army of manoeuvre. On the contrary, ragged fighting took place which continued until May 5, and the French armies, worn out by more than two years of heavy fighting, were in no condition to sustain an exhausting offensive. The united command was in the hands of a French general who had planned and conducted operations which proved to be unsuccessful. From April 15 to May 5 the British continued their operations on the Arras-Vimy front at the request of the French and in order to carry out the rôle of absorbing the enemy's reserves. During this period attacks were executed by the British on April 23 and 28 and on May 3 and 5, with the result that the line was pushed forward to include Quemappe-Gavrelle and Arleux, and some 6,000 additional prisoners and 30 guns were taken. On May 5 the great offensive operations on the Aisne and Scarpe were brought to a close, and on May 15 Gen. Nivelle was relieved of his command. This brought to naught the effort to obtain unity of command, and the operations provided a warning as to the dangers involved where armies of different nationalities are concerned.

Such was the story of a great and successful British effort under conditions of abnormal difficulty. The Russian Revolution had declared itself, the French armies had broken down, the enemy was recovering his reserve power, and the period of the year was getting late for the transference of operations elsewhere. The British field-marshall commander-in-chief then decided immediately that it was necessary to continue on the offensive and to transfer the theatre of operations to the north of Lens, where the enemy's line was weak and worn out. 

The great British offensive in Flanders was launched on July 31, 1917, and continued to be pressed throughout the autumn. Towards the middle of Aug. a slight improvement took place in the weather, and advantage was taken of this to deliver the second attack E. of Ypres. As it was desirable to prevent the enemy from weakening the remainder of the front so as to effect a greater concentration in Flanders, it was desirable and even necessary to threaten and undertake operations of a minor character at various points to pin the enemy's reserves. A highly successful operation was carried out in the neighboring area of Lens, and the threat to this town undoubtedly had the effect of preventing the enemy from concentrating the whole of his attention and resources on the main battle-front. At 4:25 A.M. on Aug. 15 the 1st and 2nd Canadian Divs. attacked on a front of 4,000 yd. S.E. and E. of Loos. The objectives consisted of the strongly fortified Hill 70, which had been reached, but not held, in the battle of Loos in Sept. 1915, and the mining suburbs of Cité Ste. Elisabeth, Cité St. Émile, and Cité St. Laurent together with Bois Rasé and half Bois Hugo. The observation from Hill 70 had been very useful to the enemy, and in the possession of the British, would materially increase their command over the defences of Lens. Practically

the whole of these objectives were gained rapidly at light cost, and in exact accordance with plan. Only at the farthest limit of the advance a short length of German trench W. of Cité St. Auguste resisted the first assault. This position was again attacked on the afternoon of the following day and captured after a fierce struggle lasting far into the night. A number of local counter-attacks on the morning of Aug. 15 were repulsed, and in the evening a powerful attack delivered across the open by a German reserve division was broken up with heavy loss. In addition to the enemy's other casualties, 1,250 from three German divisions were captured by the British. Thus not only was the British position improved but three German divisions, which might have been used in roulement on the Flanders front, were severely handled, and the enemy received a lesson which would prevent him from unduly weakening the defensive fronts.

(II) THE BATTLE OF CAMBRAI (Nov.-Dec., 1917)—After the repeated attacks delivered by the British in Flanders over a period of more than three months had brought about a large concentration of the enemy's forces in that area, with a consequent reduction of his strength and garrisons in other sectors of his front. The British object in the operations at Cambrai, which took place on Nov. 20, 1917, was to gain a local success by a surprise attack at a point where the enemy did not expect it, and on a front which had already been weakened, and thus disarrange the enemy's plans of withdrawing troops from France to operate in Italy. The sector opposite Cambrai had been carefully selected as the most suitable. The ground there was, on the whole, favourable for the employment of tanks which were to play an important part in the enterprise. II, after breaking through the German defence systems on this front, the high ground at Bourlon could be secured and a defensive flank established facing E., and opportunity should be created of exploiting the situation towards the N.W., the capture of Cambrai itself was subsidiary.

As a result of the pressure in Flanders and the Russian Revolution, large German forces had already been brought from the Russian front, partly in exchange for exhausted divisions and partly as additional reinforcements. Moreover, it was certain that heavy German reinforcements would continue to be sailed to the western front during the winter. These troops would be largely utilized to strengthen the weakened sector, and if the opportunity, which existed, to deliver a surprise attack at an early date under favourable conditions were not taken advantage of, it would certainly lapse. Against this argument in favour of immediate action must be weighed the fact that the conditions of the Flanders struggle had severely taxed the strength of the British forces, and that the losses, which had not yet been made good, had been heavy.

Another hazard the resources required for the operation were not great, seeing that the force to be employed must be small, for, owing to the requirements of surprise and secrecy, any considerable concentration of troops would be impossible to maintain. The success of the enemy's operations in Italy, too, added force to the arguments in favour of undertaking the operation; although the means available had been reduced by the despatch of troops to the Italian front, the situation on that front was critical, the Italians having been driven back between Oct. 24 and Nov. 10 from the Isonzo to the Piave.

After consideration of these factors, it was decided, by the British command, to undertake the operation. Mind the execution was entrusted to the III Army. The general plan of attack was to dispense with previous artillery preparation, and to depend on tanks, of which there would be nearly 500 available, to break down the enemy's wire and cover the infantry advance. No previous abnormal artillery fire was to take place and no registration of guns or any action which might indicate to the enemy that an attack was impending. The infantry was specially trained to work in combination with tanks, and the whole operation depended for success on secrecy and on bold, determined and rapid action.

The German defences on the selected front between Vendeuillette on the Schéldt canal and the river Sensée comprised the three
systems constituting the Hindenburg Line (greatly improved during the course of the year) with fortified posts in advance, such for example as La Vacquerie and the north-eastern corner of Havrincourt Wood. Behind this again were two other defensive lines known as the Hindenburg Reserve Line and the Beaurvoir-Massignac Line. That portion of this front which lies between the Scheldt canal and the Canal du Nord offered an opportunity for a tank drive to the N. which would include the capture of the important position about Bourlon. The full force of tanks together with five divisions (11th, 20th, 6th, 21st, 62nd) and a portion of another (36th) were allotted to this front extending from Gonnelieu on the right to Havrincourt Wood on the left. Two divisions were, moreover, to be held in reserve behind this front ready to move forward, and the cavalry was to be at hand ready to exploit a success towards the N. and turn the enemy’s defences from the rear. In order to my mind this was the only way, to deal a knock out and to drive the enemy, gas and smoke attacks, dummy attacks with dummy tanks, artillery fire, raids and subsidiary attacks were to be carried out on an extensive scale both on southern and northern flanks.

All preparations were carried out with the greatest secrecy, and during the evening prior to the battle troops and tanks were moved forward into positions of assembly, great care being taken to muffle the noise to the utmost. This was rendered particularly difficult owing to the hard and frosty weather. Each tank was provided with a compressed brushwood fascine some 8 ft. in depth, for the purpose of assisting it in crossing the main Hindenburg trench, which was of abnormal dimensions.

At 6.20 a.m. on the morning of Nov. 29 1917 the tanks and troops moved forward to the attack on a front of about 6 m. from E. of Gonnelieu to the Canal du Nord opposite Hermies. At the same hour the subsidiary and feint attacks took place.

On the principal front of attack the tanks rolled on, protected by a smoke barrage from the enemy’s artillery. The Hindenburg Line was rapidly overrun. The 22th Div. after severe fighting at Lateau Wood captured the Bonapais spur. The 30th Div. captured La Vacquerie and stormed Welsh ridge, while the 6th Div. entered Ribecourt. The surprise was complete, and the enemy surrendered in considerable numbers. The 29th Div. which had been in reserve moved forward and, passing through the 6th and 26th Divs., entered Masmiers and captured Maroing and Neuf Wood, securing the passages of the canal at both villages and the bridge intact at the latter. In this neighbourhood it was not possible to enlarge the footing gained on the E. bank of the canal, owing to the arrival of hostile reinforcements in the neighbourhood of Rumilly where severe fighting took place.

Meanwhile the 62nd and 51st Divs. attacked the Flesquières ridge, the latter being stubbornly opposed and severely delayed by the defence of that place. The 62nd Div. however pressed forward and captured Graincourt, its advanced troops entering Anneux. Flesquières continued to hold out throughout the day against the 51st Div., but troops of the 6th Div. entered Noyelles before nightfall. But for the delay at Flesquières and the destruction of the bridge at Masmiers the operations would have been completely successful, and would have opened up a great field for exploitation on the following day.

On the morning of the 21st the attack was resumed. But little progress was made on the Masmiers-Rumilly front. Farther W. the village of Flesquières, turned from the N., fell at 8 a.m., and the 51st and 62nd Divs., with tanks and cavalry moving rapidly forward captured Cantaing and Fontaine-Notre-Dame, and reached the southern edge of Bourlon Wood. Throughout the day infantry and cavalry were heavily engaged at Noyelles. On the extreme left the 36th Div. cleared the Hindenburg Line as far N. as Moeuvres.

By the evening of the 21st the British had gained possession of the Bonavis spur, a bridgehead E. of the Canal de l’Escaut including Masmiers and Noyelles, the whole of the Flesquières ridge and the ground to the N. as far as the southern edge of Bourlon Wood including Cantaing and Fontaine-Notre-Dame.

It was now nearly 48 hours after the commencement of the attack, and hostile reinforcements might be expected; at the same time it was necessary from the lie of the ground to decide whether to go on and attack the heights of Bourlon or to withdraw to the Flesquières ridge. Owing to the importance of the possession of the Bourlon heights and the visible signs of withdrawal of the enemy, having regard also to the situation in Italy, it was decided to proceed with the attack.

On the 22nd, while the British were carrying out reliefs with a view to the prosecution of the attack, the enemy recaptured Fontaine. On the 23rd the 40th Div. with tanks attacked and captured the whole of Bourlon Wood, but the attempts to secure Bourlon and Fontaine, after a severe struggle, failed.

The struggle for Bourlon resulted in several days of fierce fighting. On the morning of the 24th the Germans counter-attacked and were repulsed; in the afternoon the British attacked, captured, and beat off a counter-attack, but the resistance on the Fontaine-Bourlon-Moeuvres front was very considerable. On the 25th and 26th the enemy again counter-attacked in force and succeeded in recapturing Bourlon and the wooded spur between that place and Fontaine. The situation in the wood was now somewhat difficult; on the 27th an organized British attack succeeded in improving the position in the wood, but the troops which at one time had entered Bourlon and Fontaine were obliged to fall back again.

During the 28th and 29th no attacks took place, the troops which had been heavily engaged were relieved, and on the whole the efforts were made to strengthen the position gained. During the ten days’ fighting 15,000 prisoners and 74 tanks were taken, but the main objective, the Bourlon locality, which would turn the whole of the enemy’s positions S. of the Sensée canal and river Scarpe, had not been secured. This was primarily due to the initial failure at Flesquières village.

In the last days of Nov., signs were not lacking on the whole front of the battle, and the Germans intended to regain the positions which they had lost. On the whole of this front they had carried out artillery registration, but the importance of Bourlon to them and the massing of their troops indicated that their main attack would be delivered on the Bourlon front.

Measures were taken accordingly by the British command; this front was strengthened, while five divisions were disposed on the right flank from Cantaing to the Bouteux ravine. Farther S. the original front was held as before, the frontage being wide for the number of troops available. The Guards were in reserve about Villers Guislain, the 62nd Div. on the Bapaume-Cambrai road and the 61st Div. assembling in rear, while four cavalry divisions were available in the neighbourhood. Practically all these troops had already been heavily engaged. All troops were warned to expect an attack.

On Nov. 30 the Germans attacked about 8 a.m., delivering their main assault, as anticipated, on the Bourlon front, and a subsidiary attack on the Cantaing-Vendhuille front. The former was successfully repulsed after the most severe fighting, but on the Bonavis spur and in the direction of Villers Guislain the Germans made rapid progress. On this latter front their attack was in the nature of a surprise assault, without any previous bombardment, but accompanied by a hail of gas and smoke shells and bombs. Villers Guislain, Bonavis, Gonnelieu and Gouzeaucourt rapidly fell into their hands, but their advance was stayed by the resolute action of the Guards, assisted by tanks, which resulted in the recapture of Gouzeaucourt and part of the ridge between that place and Gonnelieu, while the troops holding La Vacquerie succeeded in keeping their opponents at bay. Meanwhile on the N., from Fontaine to Moeuvres, the enemy’s main assault, delivered between 9 and 10 a.m., and preceded by a heavy bombardment, was repulsed with heavy losses and at close quarters. This assault was repeated during the morning and afternoon, but all attempts of the Germans to gain any important success either on this front or about Masmiers failed completely. On the following days, Dec. 1, 2 and 3, there was severe fighting in the open in the
Gonnelleau neighbourhood, with the result that the Germans progressed in the direction of Villers Plouich, capturing the hamlet of La Vacquerie and thus rendering the position of the British troops defending MASNières and Marpinge extremely precarious. Further fighting continued during the next few days, but the Germans' strength was exhausted and their losses had been severe.

It now became necessary for the British command to decide whether to launch on another offensive battle on a large scale, or to withdraw to a more compact line on the Flesquières ridge. Although this decision involved giving up important positions won with great gallantry, withdrawal was undoubtedly the correct course under the conditions. Accordingly on the night of Dec. 4-5 the evacuation of the positions N. of the Flesquières ridge was commenced, and on the morning of the 7th the withdrawal was completed successfully without interference from the enemy. Captured guns and material which could not be removed were destroyed.

The new line taken up corresponded roughly with the old Hindenburg Line from N.E. of La Vacquerie, N. of Ribecourt and Flesquières to the Canal du Nord 1½ m. N. of Havrincourt, i.e. about 2 to 2½ m. in front of the line held on Nov. 20 at the commencement of the operations.

These operations undoubtedly had a direct influence on the Italian campaign, by diverting reinforcements and suspending operations at a critical moment when the Allies were making their first stand on the line of the river Piave.

In the offensive it had been hoped by a powerful tank attack and surprise to break and turn the enemy's defences where he was least prepared, and thus created a favourable tactical situation which would place him at a great disadvantage. The failure to secure immediately the Bourlon locality was responsible for the inability to create such a situation, and this was due to the accident at Flesquières, where one German officer handling a field gun put a number of the attacking tanks out of action by direct hits. Success had been very nearly complete.

During the whole of these operations the French were prepared to cooperate with a special force which had been brought forward in readiness, should an opportunity have occurred for exploitation. These troops, with the exception of a few guns which were utilized for defensive purposes subsequent to the German counter-offensive, were not brought into action and were eventually withdrawn.

These operations in the neighbourhood of Cambrai should be regarded as an incident in the great four and a half years' battle—a surprise stroke followed by a rapid counterstroke—in which although the British did not achieve their tactical object, the balance of advantage remained to a large extent in their hands. The Germans, though successful in their counter-offensive, were apparently not so successful as they had hoped to be.

The main objects of the attack had been attained. The initiative was retained and the enemy's plans deranged. German reinforcements were prevented from being despatched to the Italian front. The enemy had also been prevented from delivering an attack on the French front, which would undoubtedly have produced disastrous results.

(J. H. D.)

ARTS AND CRAFTS (see 2700).—As the "Arts and Crafts" movement grew out of impulses deeper than were, perhaps, apparent in its first artistic issues, it has continued to react in other directions. In the domain of general education its enlivening influence has helped to insure the full recognition of handicraft, an educational medium that was in some quarters treated as a mechanical exercise, as a most fruitful means of artistic expression. This most important development was a reflection of the art workers' direct efforts in education, which aimed at a complete reorganization of the technical and artistic training of young artisans on lines that were, in effect, a revival, so far as was compatible with modern conditions, of the ancient, well tried system of master-craftsman and apprentice. Although not actually the first to put these principles into practice the Technical Education Board of the L.C.C. (whose functions are now absorbed by the London Education Committee) was the first public body in England to establish a school solely for this purpose. The Central School of Arts and Crafts, opened by the L.C.C. in 1896, at first under the joint direction of Sir George Frampton and Prof. W. R. Lethaby, afterwards under the latter alone, began the combined teaching of designing and making, of craftsmanship in the fullest sense of the word, in workshops specially equipped for the production of finished work of the finest type. The methods originated in the Central School were soon adopted in other places; new schools and classes rapidly sprung up in London and elsewhere, and students from the colonies, from almost every European country, from the United States and Japan, carried its influence abroad. In 1900, when the Board of Education reorganized the training of teachers for State-aided schools of art, the courses for the diplomas in design and handicrafts at the Royal College of Art, South Kensington, had been taken over, in addition to his other responsibilities, by Prof. W. R. Lethaby. The students of the college, now trained in the practice of various crafts, have, as principals, or teachers of provincial schools, infused a new spirit into the study of design wherever they have gone. In the field of art education the genius, knowledge and enthusiasm of Prof. W. R. Lethaby, follower of Morris, and one of the most prominent figures in the arts and crafts movement, have been factors of far-reaching influence.

Organization.—Although the activities of craftsmen were necessarily restricted, or diverted into unusual channels, during the greater part of the ten years from 1910-20, the period as a whole showed progress in many directions. Local organizations held exhibitions in most of the great cities of the United Kingdom and Ireland, and in many smaller centres. These, together with the steady growth of groups of workers associated together in the practice of some particular craft, or crafts, and the ever-increasing number of skilled individuals, greatly multiplied facilities for the exhibition, sale and purchase of attractive, serviceable goods. Much new work came to the Arts and Crafts Exhibition Society, the parent body, whose periodic shows fulfill a useful purpose in maintaining a high standard of current effort—their main object. The exhibitions of the Home Arts and Industries Association, an amateur fore-runner of the arts and crafts movement, in which workers organize classes in village crafts; of the Women's Guild of Arts; and those of the more recently established National Federation of Women's Institutes, amongst others, have done useful work within their various, more restricted spheres of action.

The tenth exhibition of the Arts and Crafts Society, held in the New Grosvenor Gallery in 1912, continued in the form made familiar in previous years, gathering together into convenient focus a varied assortment of the best achievement of the day. This in some measure prepared the way for a new and important departure. In 1913 the then recently established Exhibitions Branch of the Board of Trade included arts and crafts in the British section of a foreign international exhibition for the first time. The section organized by the Board at Ghent may be said to have recognized the value of the movement as a national asset, and to have introduced officially work of the kind usually seen in London to a European public. Here an attempt was made to unite the various exhibits into a concerted scheme, and to place different groups of crafts in definite relationship to each other. A temporary building, of striking design, the work of Henry Wilson, the distinguished architect and metal worker of the carving school, opened the way to new methods of arrangement, and a more interesting form of setting, which were developed still further in future exhibitions. So great was the success of this venture that in the following year a great part of the collection, the best and most extensive that had yet been brought together, was, on the invitation of the directors of the Louvre, transferred to Paris. The special exhibition of British arts and crafts opened by the Board of Trade in the spring of 1914, in the Pavillon de Marsan of the Palais de Louvre, the home of the Musée
des Arts Décoratifs, was a second edition of the Ghent display, set out in a way that added much to its interest and value. Historic masterpieces of the great pioneers of the 19th century, fine examples from former London exhibitions, and new work that had not previously been shown combined to give a review of the growth of the British arts and crafts movement that was of unparalleled interest. The architectural setting, again due to Henry Wilson, adapted the magnificent galleries to their new purpose with complete success. The attainments of British craftsmen, the directness and novelty of their designs and the quality of their workmanship, shown to a public that had not yet seen any considerable collection of British work of this kind, gained enthusiastic appreciation. In Aug. 1914 the exhibition was hurriedly dismantled, and, as it was impossible to return the exhibits to England, the collection was buried in the cellars of the Louvre until the end of the War.

In the autumn of 1916 the Arts and Crafts Society held an exhibition at Burlington House by the courtesy of the Royal Academy, and this helpful interest brought the two bodies together most happily for the first time. A room devoted to a small but representative assemblage of earlier work continued an inspiring feature of the Ghent and Paris shows, including much, now in private hands, that, although well enough known in certain circles, had not been seen by a younger generation. These examples included some of the varied productions of Walter Crane (1845-1915), of leading designers of the era, D. G. Rossetti, Ford Madox Brown, Edward Burne-Jones, and others of the same school, and bore witness to the remarkably versatile genius of those times.

Innovations in the arrangement of the exhibits, inherited from the European ventures, and daring developments of the decorative setting of the exhibition that displayed the enterprise of the designer, the new president, Henry Wilson, and the skill of the constructor, Francis W. Throup, brought an un- wanted liveliness into the Academic precincts. A series of large paintings in temporary architectural surroundings completely masked the walls of several rooms of the Louvre. In this practical exercise of the revived interest in mural decoration were adventures in work of unusual scale by Augustus John, William Rothenstein, Charles Sims, George Clausen and Maurice Greiffenhagen, to mention but a few of the many well-known painters who took part in the most imposing experiment of the kind yet attempted. A series of rooms were erected, decorated and completely furnished by groups of craftsmen, and appropriate collections were brought together in illustration of "Univiversity," "Ecclesiastic" and other types of work. A particularly encouraging feature was the number and quality of exhibits by young and less well-known producers of art and crafts. Groups of students working under the direction of their masters also took part in the decoration of the galleries, a new departure in collective effort that should bear good fruit in the future.

Relation to Industries.—In this exhibition a room was set apart for a small display of articles of everyday use of a kind hitherto unrepresented in the Society's shows, arranged by the Design and Industries Association, a body that had been recently formed to better the quality and fitness of goods on sale to the general public through the usual channels of supply. This Association pays but little attention to stand-by-stand exhibits, but its activities are of a larger and more general nature. One side of a room was devoted to textiles, and on the other, but aims at securing an increased output and sale of all kinds of products of the best possible quality. By means of its well-produced publications, able lectures, and instructive exhibitions the Association has gained considerable influence all over the United Kingdom, and has succeeded in banding together in close cooperation a number of designers, craftsmen, manufacturers and distributors. It was becom- ing a recognized fact in the British arts and crafts movement that the British public, while they spent every year a larger amount of money for artistic productions, were becoming more and more critical, that the public was demanding that their goods should be artistic. This spirit of inquiry was gathering great advantage from the ideas of British designers—indeed in some cases more than were the British themselves. The British manufacturer and designer had come to regard each one with a certain amount of suspicion; the one had no use for the "long-haired artist," who in his turn mistrusted the standards of design of the other. Foreign observers, especially in Germany, were taking deep interest in the British arts and crafts movement, and were drawing very practical results from the knowledge they had gained. So thoroughly were these investigations being carried out that at least one German university had established a professorial chair for the special study of the economies of arts and crafts. Foreign goods that found their way into the British markets of design and arts and crafts were not only meeting an ever widening market, not only abroad, but also in England. As a case in point the history of English influence on German printing is interesting. Several German type founders cut punches "after the English model," i.e. they worked from Matrices (i.e. matrices) to English letter founders, who gave the type English names in blissful ignorance that the designs were of English origin. Henry Wilson and J. G. Strahan and Company found an ex- tension of production and distribution and endeavours to bring together all concerned in an attempt to attain high standards of work and to promote their common interests. Its small exhibit at the Royal Academy was one of the best exhibition to which illusrators and manufacturers were invited. The British artist, and those who were interested in the arts and crafts movement, were keenly interested in the possibility of setting up a temporary exhibition at the Academy, and Sir Henry Liddell joined with Mr. Fry in the promotion of this. The Fry gave an illustration of his very novel designs, and was a signal demonstration of the craftsmanship of the selection committee of the Society.

Encouraged by its success in introducing the products of British craftsmanship to foreign buyers, the Board of Trade determined to extend its efforts so as to include all possible markets, at home as well as overseas, with enthusiasm. But however commercial the tendency in 1920, the British Institute of Industrial Art, with Sir Hubert Llewellyn Smith as chairman. One of the chief means by which this new body proposed to further its objects was the establishment in various parts of the world of centres of current industrial production, of a high standard of quality, and of the latest developments in industrial art. It also undertook the organization in the provinces and abroad, of special temporary and travelling exhibitions of the works of living British artists, and also proposed to establish a purchase fund with the object of securing for the State selected modern work of outstanding merit. All work intended for exhibition comes before a selection committee, of which one section is composed of manufacturers and craftsmen, and another of artists who set themselves high ideals of design and workmanship. The labour of these are, indeed, the basis of their operations, which are primarily intended to supply the demand and so to widen his sphere of action by giving him his proper place in the control of machine-made things.

Calligraphy and Illumination.—The present renaissance of writing is due not only to the efforts of the calligraphers and illuminators, but also to the encouragement of those who use handwriting in their daily work. The teaching of handwriting, for instance, is widely considered to be one of the most important of educational foundations.
watchful study of birds and flowers, have a delightful brightness of colour and design. His ornaments for the Cape Town memorial of the hero of the Burjum, designed by Stanley Wyatt, were interesting examples of his work in another vein.

**Printing.** —During the earlier years of the century book production on the Continent was not less active than had been the case in England. Firms founded in 1900 by T. J. Cobden-Sanderson and Emery Walker, were rapidly taking a place as the sole possible rivals of the classic products of the Kelmscott Press, to the excellence of which the excelsiorism of others was later to be compared. Cobden-Sanderson, founder of the Ashendene Press, books, printed by C. H. St. John Hornby, and those of Charles Ricketts’s Vale Press, were also increasing the reputation of British printing. In the trade generally a new activity was apparent; fine examples of books, and types of chiefly delicate richness, books based upon British models, or even produced under the supervision of authorities such as Emery Walker and Douglas Cockerell, showed how the genius of British printers and binders was growing in foreign appreciation. No trade, however, felt more severely the stress of the years of war; no new press of outstanding merit arose to range its products with the earlier triumphs of the century. An edition of the Odyssey was issued by the Oxford University Press, printed in the Greek type designed by Robert Proctor (1898-1903), and a new feast, designed by Herbert P. Horne (b. 1864), was used by the Riccardi Press. The old-established Chiswick Press of A. W. Pollard, who had made the term “Bedford type” so familiar, the affectionate expression for it a worthy place in the revival of fine book work. Technical education in book production was developed in a special department of the Central School of Arts and Crafts under the supervision of Lawrence Street, who had left the firm of J. H. Mason, an authority on printing, and a binder, Peter McLeish, the students produced books of quite extraordinary merit, and gained in a few years a very complete introduction to the whole fields of the trade and book decorating of the day. Among these may be mentioned a fine gift book by the name of “The Story of England,” by John Gimson, with a partner G. Sutcliffe, and Charles McLeish, the younger, who inherited much of his father’s skill. Cockerell’s careful study of “Library binding,” suitable for everyday use, was specially serviceable in showing what could be done by combining the best of the old methods with a new. His books his patient craftsmanship and wide experience gave a new lease of life to many priceless volumes in public and private libraries. Queen Mary lent for exhibition in Paris a beautifully bound copy of the Book of Kells, and won much praise for this. In 1907-1912 a new partnership was formed, consisting of two brothers, who worked together with great success, and produced many fine books, including the complete works of Shakespeare, although during the war there was no opportunity for further work on well-tried principles. H. Deable followed closely the tradition of Morris. The designs of C. A. Voysey showed pleasing originality, and those of Heywood Sumner the strength and bound style of the Arts and Crafts movement. These, however, were not the only wallpaper designers. J. F. Hansan, who worked between his time as a fabricier, was notable among those who made the name of Stourbridge synonymous with successful design and colour, and had a great number of distinctive stuffs, of his own design. E. W. Tristram, an excellent designer and draughtsman, and J. F. Haseman, who worked between his time as a fabricier, was notable among those who made the name of Stourbridge synonymous with successful design and colour, and had a great number of distinctive stuffs, of his own design. E. W. Tristram, an excellent designer and draughtsman, and J. F. Haseman, who worked between his time as a fabricier, was notable among those who made the name of Stourbridge synonymous with successful design and colour, and had a great number of distinctive stuffs, of his own design. number of large hangings and other pieces of quite modern character. Her enthusiasm and knowledge trained a large following of pupils. W. H. Burges, the architect, gave her the benefit of his art, and the lines of various kinds, ranging from heavy applique work to things of gossamer-like substance, showed a break in yet another direction. This collection shows the use of traditional and half-forgotten technical methods, rather than from archaic turns of design. The collection of very original samplers and other specimens, by Mrs. Christie and her pupils, illustrating a wide range of stitches, with little or no use of frames, shows the Kpan (Kpan) Exhibition at Lahore (1891); the R. H. H. at the Birmingham School of Art some interesting experiments in directly stitched embroidery, that, for its effect, relies more upon interest of design and composition of diverse pattern; Louise F. Peal followed Eastern models, in the intricate workings of which she is an expert exponent.

In the field of crafts workers, Henry Wilson occupied a most prominent place. Equally successful in a great door of bronze, a silver cup or a minute piece of enamelled jewellery, his many-sided genius recalled the versatile masters of the greatest ages of craftsmanship. His bracelets, tasselled taffetas, and other beautiful jewellery, with their delicately modelled figures and rich ornaments, chased, or enamelled in glowing colours, had wondrous brilliance and character. His ecclesiastical work broke entirely with hackneyed fashions, but maintained the great spirit of significant magnificence. The collection of Wilson's work shown in Paris will long be remembered. R. Catterton Smith, another metal worker, silversmith and jeweller, with a rare combination of ability, was an inspiring teacher; he made famous the Birmingham School of Art, of which he was principal. Amongst other silversmiths and jewellers whose work combined sound craftsmanship and distinctive decorative quality, and Arthur H. Goodwin and W. Bainbridge Reynolds' varied work showed great individuality and skill. As a designer and maker of fine serviceable things for domestic use W. A. S. Benson became very well known. Amongst the specimens shown at Paris in 1900, the rich sword and spur by H. R. H. the Prince of Wales at his investiture at Carthusia in 1911, had a romantic interest. These, and a number of other works, were made for the firm of Garrard & Co. The death of Henry Longden (1831-1910) removed a master metal worker of sound taste and wide knowledge, who was one of the pioneers of the arts and crafts movement.

Artistic Work.—The signed glass of Christopher W. Whall showed a perfect combination of artist and master craftsman. Beautiful drawing, mastery of colour and design, united with sure technical knowledge in work of the highest rank. His rare capacity in mastering and rendering various phases of glass, with a group of pupils, amongst whom Karl Parsons was prominent. Louis Davis was another glass painter who was a thorough master of his craft.

A successful monograph, "The Arts and Crafts Movement in America," by Miss Walter, appeared in 1907. The book was based on the results of her researches in the United States. The writer visited all the important centers, both in the cities and in the country, and there met a number of artists who are now nationally known as leaders in the development of the arts and crafts movement. She gives a clear and authentic account of the growth of the movement in America, the rôle of the several organizations, the media of expression, and the influence of this new art on the general cultural life. The book is a valuable contribution to the study of the arts and crafts movement in America, and a useful guide to the student and the tourist.

The first American arts and crafts society was instituted in 1887 at Hull House, Chicago. The Boston Society of Arts and Crafts was formed a few months later. Following these, societies multiplied rapidly until there was no large city and scarcely a town or village which had not its local group. New York's society dates from 1904, and was for some years affiliated with the National Arts Club and called the National Society of Craftsmen, numbering shortly after its founding several hundred members. The name "Craftsman" was dropped, and the society took the name of the New York Society of Craftsmen. At Philadelphia a house was fitted up, with individual studios in connexion with the salesroom. Detroit and Milwaukee early developed active art centres, each with its own building, exhibition rooms and classes. Besides these regular arts and crafts societies there grew up many so-called "gift-shops," with or without tea-rooms.

Industries like those of England were instituted from time to time, but did not flourish as well as the cooperative groups. That of the Abnakee, at Pequaket, N.H., one of the early and most successful, was conducted by Mrs. Albee who originated the patterns from Indian designs, the name being that of a tribe of Indians from which the Abnakee formed the basis of their work. The rugs, hooked rugs, were worked by the country women of the neighbourhood in their homes and paid for by the square foot. As they suited well the "craftsman" style of furniture, they were in great demand, and the factory, which was incorporated in 1895, was given up. Similar industries were conducted in Cranberry, I. Me., and in the mountains of the south. Industrial and experimental groups were conducted in connexion with colleges, that of Alfred, in the State of New York, and that of Smith College, Nev. Chire, successful examples. At the latter a style of pottery was developed, produced by graduate students and sold by the college for them, in which the motifs were taken from the native flora. A similar group in embroidery created some beautiful things in stitchery and appliqué. Semi-commercial enterprises also sprung up which were varied in their plan and output. The earliest and best known is that of the Rockwood Pottery, at Cincinnati, Ohio. The Grueby Pottery, although for financial reasons short-lived, was most distinctive, as was the Dedham ware. Both of these came from the neighbourhood of Boston, where too was the Paul Revere Pottery, made and sold by Mrs. J. M. Murray, from whose hands the best work from the "Factory of His Time," has spread to the present time. Enough of the original patterns were taken from the doors of porcelain stoves brought over by the "Pennsylvania Dutch" settlers of that region. These are a few of the most prominent of the many art industries which have developed in connexion with the arts and crafts movement, and for other styles more or less modelled upon it, the furniture of the Erskine-Danforth Co., New York, being perhaps most nearly in harmony with the spirit of simplicity associated with the arts and crafts idea. Individual societies, as has been said, sprung up spontaneously, and although there was a kind of freeasonry among them each
remained independent and unattached. To bring them together and to unify the movement there was formed in Boston 1907, just 10 years after the founding of the national league of handcraft societies, the Metropolitan Art Craftsmen's Association. This was taken over by the National League of Handicraft Societies and published, with a few changes, as the monthly magazine Handcraft. In 1909 the National Society of Craftsmen, N.Y., brought out an English-language monthly The Arts & Crafts magazine, published independently at Washington's Crossing. N.J. Both the handcraft and The Arts & Crafts were bought out 1913 by the American Federation of Arts. This flourished for 13 years, and was replaced by the successor ethic magazine, The Craftsman, which had a great deal to develop taste along these lines. The Craftsman was owned by John Ruskin and his nephew and successor, the beautiful idea and in 1921 by Morris as a practical one. In 1921 the handcraft idea had no organ of its own except as represented in the American Magazine of Art of the Federation.

Asch, Oscar (1872—), English actor, was born at Geelong, Victoria, Australia, June 26 1872. He studied for the stage at Christiania. At appearing at the Queen's Theatre, London, in 1883, he joined F. R. Benson's company for eight years, playing numerous parts in Shakespearean and old English comedy. He next played Mal- donado in Pinoiro's Iris at the Garrick theatre, London. In 1902 and again in 1904 he played in Shakespeare with Herbert Tree at Majesty's theatre. He began management at the Adelphi at the close of that year, and, with his wife, Miss Lily Bryton, presented The Tempest and The Winter's Tale. In 1907 he presented Laurence Binyon's Attila at His Majesty's theatre and also As You Like It and other Shakespeare plays. Subsequently he to 1911 he specialized in the presentation of spectacular oriental dramas, the best known being Kismet, played at the Garrick theatre, London 1911-2, and Chu Chin Chow, first produced at His Majesty's Aug. 31 1916 which ran for nearly five years. In Oct. 1921 he produced Cairo.

Ashanti (see 2,742).—By an Order in Council dated Oct. 22 1906, the boundaries between the Ashanti Protectorate and the Crown Colony of the Gold Coast, of which the former is the principal dependency, were readjusted and defined with due regard to tribal lands and natural features. For administrative purposes Ashanti has been divided into the Gold Coast. The Southern, and the Northern, each of which is under the charge of a provincial commissioner. The capitals of the provinces at which these officers have their headquarters are respectively Kumasi, which is also the capital of Ashanti; Obuasi, a considerable town situated upon the Kumasi- Sekondi railway some 50 m. due S. of Kumasi, and the principal centre of the Ashanti Goldfields Corporation; Sunyani and Kantamanto. Each province is divided into districts which are under the charge of district commissioners, who in their turn are aided by a staff of assistant district commissioners. A chief is an officer who assists the governor in presiding over the district. The officers of the Governor, the Standing of the World War knew as a section of the Ministry of War, but hurried to the Russian front, where he commanded first the 17th Div., and later the VI. Army Corps. He shared the success of the battle of Limanow-Lapanow in Dec. 1914, which definitely stopped the Russian offensive, with Col.-Gen. Freiher von Roth (b. at Trent in 1895). In the spring and summer campaign of 1915 Arz and his corps acted with Mackensen's German army, and fought with special success in the neighbourhood of Przemysl and in the further course of the campaign captured the fortress of Brest-Litovsk. Appointed to the command of the 1st Army in the summer of 1916, he had as a task to defend that country against the Rumanians, whom he, in conjunction with Falkenhayn's German troops, drove back into Wallachia. After the retirement of Conrad von Hützendorf, Arz was appointed by the Emperor Charles chief of the general staff of the Austro-Hungarian armies, the department of operations being conducted under his direction by the able Maj.-Gen. Alfred, Freiher von Waldstätten (b. at Vienna in 1872).

Artsibashev, Mikhail Petrovich (1857—), Russian novelist, was born in South Russia Oct. 18 1878. His family was of Tartar descent, and on the mother's side he was a great-grandson of Koskiuksko. He at first followed an artistic career, and attained some fame as a caricaturist, but subsequently began writing short stories, followed by novels. In 1912 he was imprisoned for several months by the Imperial Government as a revolutionary. His collected works were published in Moscow in 10 volumes 1915-7, and contain—Raszkazi (Tales); U poslednej chertii (At the Extreme Limit, translated into English as The Breaking Point, 1915); Zakon dibarya (The Law of a Misanthrope); Renlost (Jealousy); Voina (War, translated into English 1918 under the same title) and Samin (translated into English as Samiin, 1915).
which they are called upon to preside, the selection being, however, confined to candidates belonging to one or more noble families in which the office of Ashanti is to this day traced exclusively through the female side; whereas a chief is succeeded by one of his brothers, by one of the sons of one or other of his mother's sisters, or by the sons of one of his own sisters, but never by the sons of his own brothers.

The position of the mother in a tribe to be one of great prominence, and it is not uncommonly happens, when a doubt arises as to the rival merits of two claimants, that a vote of the whole tribe shall be nominated for election by the tribe is submitted to her for determination.

The omanhene and the various offensive of each tribe exercise criminal and civil jurisdiction within the tribal boundary, and, in such jurisdiction being exercised by their elders of the chief commissioner, issued with the approval of the Governor, and the Gold Coast. Courts possessing progressively wider powers are presided over by the assistant district commissioners, district commissioners, and, are traced out, judicial committees of all capital cases and civil cases of importance were tried and determined in the court of the chief commissioner. Shortly before 1921, however, an act of judicial commissioner was created, which is held by a qualified barrister, whose duty it is to try all capital and all important civil cases, and to revise the judicial work of the officers of the administrative staff. Lawyers are not permitted to practise in any of the courts of Ashanti, and the chiefs have taken upon them a very strong resistant attitude whenever their admission has been mooted. They depreciate action which they believe will cause justice to become expensive and which is calculated to promote ruinous litigation among the tribes, especially in the land districts.

After the conquest in 1896, the internal peace of Ashanti remained undisturbed and the decade immediately preceding the outbreak of the World War was marked by considerable progress. The administrative staff was greatly increased; a first-class motor road from Kumasi to Ejura, a distance of 61 miles, was completed in June 1912; schools were established by Government at Kumasi and Sunyani to supplement the 24 schools which in 1913 were being conducted by the Basle Mission; and the cultivation of cocoa spread from the colony, where it had already made great progress, into Ashanti.

No idea of the true financial position of Ashanti is conveyed by the published Report of the Privy Council of the Gold Coast or by reports duties on articles designed for consumption within it, which are collected at the ports of entry on the Gold Coast, nor yet with the revenue derived from goods carried on the Sekondi-Kumasi railway.

On the other hand, the main expenditure on the Gold Coast has been the payment of the Gold Coast Public Service for the year 1913. The total expenditure for the year was £21,105,490, of which £2,085,490 was for the purchase of goods and £10,000 for the payment of interest on the public debt, and £19,075,900 was for the payment of salaries and wages. The revenue of the Gold Coast for the year 1913 was £23,205,200, of which £20,600,000 was derived from taxation and £2,605,200 from miscellaneous sources.

In his annual report for 1914, Mr. (afterwards Sir Francis) Fuller was able to record "the unexampled and deep loyalty expressed by all the Ashanti chiefs towards their Sovereign and Government on the outbreak of war"; and so complete was the confidence felt in these sentiments that from Aug. 1914 onward the government of the Gold Coast was able almost totally to demobilise Ashanti troops in order to despatch expeditionary forces to take part successively in the Togoland, Cameroon and East African campaigns. Ashanti provided few recruits for these forces, the people disliking the military discipline which is so dissimilar to their own methods of warfare, and the spread of permanent cultivation (cocoa) having attached them to the soil to an extent unknown in former times. Their loyalty, however, remained unabated throughout; and the years of the war were marked by great local development.

The total length of roads suitable for motor traffic were available, most of which had been constructed by the tribes themselves under European supervision, and large numbers of lorries were at work carrying the cocoa crop to rail-head. The exports in 1913 amounted to 8,862,431 cwt., valued at £666,227,175; 185,000 tons, valued at £6,692,230,759; hides and skins, 5,671,012; snails, £10,000; miscellaneous £5,000. The value of the imports had risen to £7,737,257, the principal items being European goods worth £1,500,000, coffee worth £1,000,000, cocoa beans worth £4,000,000, and coffee beans worth £5,000,000. The quantity of gold exported had slightly declined, but the export of cocoa had risen from 5,663 tons in 1913 to 32,000 tons in 1919, and the increased imports of live stock are due to the enhanced consumption of meat by the rural population alike in Ashanti and in the country. The spread of cocoa cultivation. Wild African rubber had ceased to be worked. Large numbers of live stock and snails, which are a local delicacy, were re-introduced.

ASHBOURNE, EDWARD GIBSON, 1ST BARON (1837-1913). Irish lawyer and politician, was born in Dublin Sept. 4 1857, and was educated at Trinity College, Dublin. He was called to the Irish bar in 1866, and in 1872 became a Q.C. In 1875 he was elected for Dublin University as a Conservative, and in 1877 became attorney-general for Ireland in Disraeli’s Government. In 1885 he was made Lord Chancellor of Ireland with a seat in the Cabinet, and raised to the peerage, holding the same office in the Conservative Governments of 1886-92 and 1895-1905. Lord Ashbourne took a prominent part in the early negotiations for land purchase in Ireland. He died in London May 22 1913, and was succeeded as 2nd baron by his eldest son, William Gibson (b. 1868).

ASHFIELD, ALBERT HENRY STANLEY, 1ST BARON (1874- ). British politician and man of business, was born at Derby Nov. 8 1874. He spent his early years in the United States, and was educated at various American technical schools and colleges. He entered a railway office and had a successful business career, becoming general manager of the Detroit United Railways and the Public Service Railways of New Jersey. In 1910 he returned to England, and took up the position of managing director of the traffic service which included the Underground Electric Railway Co. and the London General Omnibus Co. In 1914 he was knighted. On the formation of Mr. Lloyd George’s Government in 1916 Sir Albert Stanley was elected to Parliament for Ashton-under-Lyne, being included in the Cabinet as President of the Board of Trade. He was a notable instance of a minister selected as a “business man” and not for any of the usual political considerations. He retained his office until May 1919, when he resigned and was raised to the peerage.

ASHLEY, SIR WILLIAM JAMES (1862- ). English economist (b. 1873), serving during the World War on a number of Government committees, especially with regard to food prices and the cost of living. He was a member of the Consumers’ Council appointed in 1918 to assist the Ministry of Food. In 1913 he had been president of the Economic History section of the International Historical Congress, and in 1914 he was one of the authors of the report on Industrial Unrest published by the Unionist Social Reform Committee. In 1912 he published The Rise in Prices and Gold and Prices, and in 1914 The Economic Organisation of England. He was knighted in 1917.

ASHWELL, LENA (1877-1954), English actress (b. 1877), at the outbreak of the World War organized a Women’s Emergency Corps for rendering services of all kinds to the Allied forces and to refugees, as well as assistance to women at home thrown out of work by the dislocation of industry. She also formed a company of actors and musicians and went with them to France, where they provided excellent and much-appreciated entertainment to the troops when resting. She was made O.B.E. on the institution of the Order of the British Empire Aug. 24 1917.

ASIAGO BATTLE OF, 1918.—The Asiago plateau was the scene of various battles on the Italian front during the World War (see ITALIAN CAMPAIGNS); but what is called pre-
"the battle of Asiago" was that which was fought in the Austrian offensive of 1916, resulting in the first enemy occupation of Italian territory.

An attack from the Trentino with the object of cutting the Italian communications with the Julian front, and so bottling Cadorna's main force in what Krauss calls "the Venetian sack," was an operation which could not but commend itself to the Austrian general staff. In the words of Falkenhayn, who refused his cooperation to the proposal made by Conrad von Hützendorff in Dec. 1915, "this project contemplated an operation which must, once at least during the war, have certainly attracted the attention of every general staff officer who took a look at the map of the Italian theatre of war. It was very inviting." Falkenhayn's refusal to join in the enterprise was based on various grounds; his belief in the prospects of success at Verdun; his attempt, and that of the Italian Army, to reduce the threat he was facing; and his preference for a more independent, from the Austro-Hungarian point of view, offensive towards the Adriatic, an operation which required him to refrain from any other movement in the Trentino. This was contrary to the scheme of Falkenhayn, as well as to the scheme of Cadorna thought the railway communications insufficient. He assumed, moreover, that Conrad had reasonably accurate information about the forthcoming Russian offensive and would not risk attacking at such a distance when the Russian threat was imminent. But Conrad hoped to attack sooner than he eventually did; his troops were not ready in April, but the snow caused a delay which gave rise to much impatience among the Italian officers. In short, Conrad persuaded himself that his troops in the east were strong enough to resist any pressure that could be brought against them.

Cadorna was sceptical of an offensive in strength, and thought that the reported movements in the Trentino signified a limited attack, to be undertaken with the object of hampering his offensive towards the east. In the late autumn and winter he had reduced the strength of the I. Army to the minimum in order to strengthen his attack on the Isonzo, and in reply to Brusati's expressions of anxiety regarding the adequacy of his forces during this period Cadorna pointed out that the requirements of the Isonzo front made it necessary to reduce the numbers of the I. Army, and that in the event of a threat developing from the Trentino there would be sufficient warning to allow the reinforcement of the front in good time. He reminded Brusati, on various occasions, that the rôle of the I. Army was strictly defensive. He had already indicated, early in the campaign, the defensive lines to be prepared, and had on various occasions insisted on the necessity of strengthening these lines. During the first few months of the war the troops of the I. Army had advanced at various points beyond the limits laid down by Cadorna, and in these sectors the army was aligned for offensive action. This would not have mattered had the necessary works had been carried out, but the energies of the troops had been directed to preparing elaborate works in advance positions not well suited for defence, and the positions chosen by Cadorna for the main line of resistance were in many cases untouched. Brusati had carried out successfully the initial part of his work, the reduction in length of the Trentino front. The original front of the I. Army, from the Stelvio to Croda Grande (east of the Val Cismon) is close upon 240 m. in length, but the advances made in the first weeks of the war had shortened the line by over 100 miles. The second part of the army's task, in detaching the troops of the Isonzo front towards the Alps, was feasible for the operation of troops in large numbers, had been neglected in certain important sectors.

It was on March 22 that the probability of an Austrian attack was first reported by the I. Army command, whose initial requests were granted at once, the transference of two brigades to the Isonzo front being countermanded, and four additional brigades being placed at Brusati's disposal. In his answering dispatch Cadorna repeated the instructions to fall back upon the principal line of resistance in case of an enemy attack. On April 2 Brusati sent a further report upon the concentration of enemy troops in the Trentino, and stated that he had taken the steps which he considered to be most opportune in relation to the means at his disposal. In reply Cadorna detached two more divisions, the 9th and 10th, from the general reserve in Friuli, to be held in reserve at Schio and Bassano, and gave an additional group of Alpine battalions to the I. Army. As a result Brusati wrote, on April 6, that the reserves given him allowed him "to view with complete confidence even the most unfavourable event." Although Cadorna was still sceptical in regard to an offensive in force, he increased Brusati's artillery strength by 18 batteries of middle-calibre guns and gave special orders for the supply and transport of ammunition. On April 21 at Cadorna's request Brusati sent a report upon the defensive
system between the Val Lagarina and the Val Sugana, accompanied by a map showing the various lines, stating that the conditions were "re-assuring," and that the third line of defence upon which Cadorna had laid special emphasis could be considered as being in a satisfactory state of efficiency. Three days later Brusati suggested the reinforcement of two sectors of the line, that between the Vallarsa and the Val Terragnolo, and the Tonezza sector, between the Val Terragnolo and the Astico. He asked for permission to split the 9th Div., which had been given him as a reserve, and send a brigade to each of the sectors mentioned. He also asked for another division to be held in reserve about Vicenza. Cadorna was willing to break up the 9th Div. and order that it should be held in reserve at Schio, within easy reach of the Vallarsa sector, while to reinforce the Tonezza sector he dispatched an additional brigade from the general reserve. He also detailed the 27th Div., in reserve on the Tagliamento, to be ready as a further reinforcement and formed a further artillery reserve of 10 heavy batteries.

At the end of April Cadorna went to visit the lines in person. He found that while the front lines had been elaborately fortified, in various sectors the reserve lines which he had indicated as the "battle positions" were almost untouched, and parts of the front line were unsuitable for prolonged resistance. Between the Val Lagarina and the Vallarsa and along the Val Terragnolo the Italian lines formed a dangerously exposed salient, running down from the high slopes and completely dominated by the Austrian guns on Monte Biavena, Monte Ghello, Monte Finonchio and the Folgaria plateau. In the Val Sugana the same fault was observable. The forward lines on Monte Armentera and Monte Salubro were poorly adapted for defence, but had been strongly fortified, while the line east of the Maso torrent, which Cadorna had indicated as the main line of defence, had undergone little preparation. Cadorna ordered the positions to be modified. The bulk of the heavy guns were withdrawn to the second line and the work of preparation was hastened on; but as enemy attacks seemed imminent, it was impossible to set about a complete reorganisation under the immediate threat.

On the wings it was possible to improve the situation. In the centre the problem was different, for here the Italians were of necessity badly placed. The salient of Soglio l'Aspési (4,375 ft.), between the frontier and the Upper Astico, was practically in the air, and could only be considered as an outpost. But the main line between the Posina and the Astico, which ran by Monte Maggio (5,730 ft.), Monte Teroraro (6,175 ft.), Campomolon (6,030 ft.) and Spitza Tonezza (5,572 ft.), was not satisfactory for defensive purposes. It was close under the enemy fire, and it had no depth. Behind the line the ground falls away southeastward in a steep glade that drops abruptly in the end to the Posina on the south and the Astico on the east. It was owing to the essential weakness of this line and its extension northward to the west of the Val d'Asa that Cadorna had ordered the preparation of a third line of defence that ran from Cima Portole (7,570 ft.) east of the Val d'Asa and round the southern rim of the Asiago basin by Punta Corbin across the Astico to the mountains south of the Posina. This line was shown as existing upon the map sent to Cadorna on April 27 by the I. Army command. In the map he had instructed the lines were drawn and the tracings on the map. The project had remained a project.

On May 8 Brusati was replaced by Gen. Pecori-Giraldi, the commander of the VII. Corps (III. Army). A few days previously Cadorna had modified the system of commands in the threatened sector. Up to the time of his arrival on the I. Army front the whole line between Lake Garda and the mountains east of the Val Sugana had been included in the V. Corps command (Gen. Zoppi). The Val Lagarina and Val Sugana sectors were now placed under independent commands, and the long line held by the V. Corps was reduced to include only the hill country between the Vallarsa and the eastern edge of the Asaagio plateau. On the eve of the Austrian attack the alignment of the I. Army was as follows:—West of Lake Garda the line was held by the III. Corps (two divisions) under Gen. Camerana. The Val Lagarina sector, from the lake to Zugna Torta, was held by the 37th Div. under Gen. Ricci Armani (two brigades, three battalions of Alpini, with several weak battalions of territorial Militia). The Sicilia Bde. was arriving in the Adige valley to act as a reserve. The left-hand division of the V. Corps (the 35th) was in line between the Vallarsa and the Astico, the Roma Bde. right down upon the Val Terragnolo, backed by a territorial Militia regiment in Col Santo and two Alpini battalions holding the Borcola Pass. The Ancona Bde., freshly come into line, lay from Monte Maggio to Camponmol, while the Cagabria Bde. was echeloned forward in the Soglio l'Aspési salient, and a group of Customs Guards battalions held the edge of the Val d'Asco. Two brigades of the 34th Div. and a group of Alpini held the Val d'Asco and a line that roughly followed the frontier as far as Cima Manderiolo (6,665 ft.). A third infantry brigade and two brigades of territorial Militia lay in immediate reserve. The right wing of the army, occupying the Val Sugana sector (extending to the Val Cismon), consisted of the XVIII. Corps under Gen. Etna, three infantry brigades, four battalions of Bersaglieri and six battalions of Alpini. The 9th Div. lay at Schio, ready to reinforce the Vallarsa—Val d'Asco sector, while the 10th Div. was at Bassano, and a group of Alpini was at Marostica. The 44th Div., freshly returned from Albania, was concentrating in the north and still lay on the Tagliamento, where the X. and XIV. Corps were ready to leave in case of need. In all Pecori-Giraldi had at his immediate disposal 130 regular battalions, even battalions of Customs Guards and 45 battalions of territorial Militia, the latter at very low strength and of small fighting value. The 44th Div., which was not ready to move at the beginning of the battle, brought the number of regular battalions up to 142. The artillery strength consisted of 831 guns, of which 348 were of heavy or medium calibre and 250 were light guns of position.

The Austrians had a great superiority in artillery, upon which they relied for breaking their way through the Italian lines. Between the Val Lagarina and the Val Sugana were concentrated some 2,000 guns, of which nearly half were of heavy or medium calibre, including 40 305-mm. howitzers, four 380's and two or three German 420's. The attacking force was arrayed in two armies, one behind the other, Dankl's XI. Army in front with nine divisions, von Koevess's III. Army in support, with five divisions. The troops in the Val Lagarina and the Val Sugana were not included in this force, which was to make its offensive between the two valleys, where only supporting attacks were to be carried out. Krauss, as chief-of-staff of the Archduke Eugene, was opposed to the disposition of the two armies and the limitation of the attack to the right. He said that the thrust of attack should be divided between Dankl and von Koevess, and pressed for the adoption of his plan for the concentration of attacking masses in the valleys, especially in the Val Sugana. But the original plan, prepared in all its details by Conrad and his staff, was not modified; it would seem that the Archduke Eugene and his chief-of-staff had little freedom of action. The tactical direction of the attack was entrusted to Dankl, who had at his disposal some 180 battalions.

The offensive opened on May 14 with a very heavy bombardment along the whole line from the Val Lagarina to the Val Sugana. Between the Val Lagarina and the Val Sugana the concentration of fire was most intense between the Vallarsa and the Upper Astico, and against this sector, the following day, the main infantry attack was launched. The plan was to attack first with the right wing of the XI. Army, commanded by the Archduke Charles, supported not only by its own artillery but by flanking fire from the massed guns on the Lavaretto plateau. When the right wing had made sufficient ground the left wing was to come into action against the Italian line in the Seven Communes, north of the Upper Astico. On the extreme right of the attack, between the Val Lagarina and the Vallarsa, the Italians withdrew from their ill-chosen front lines, fighting steadily and making the enemy pay for the ground gained. In the Val Terragnolo the Rube Bde. was run over by the enemy attack. Many prisoners were taken, and the second line, which was withdrawn in accordance with the general instructions given by Cadorna, came back in some disorder.
Against the forward line between Monte Maronia and Soglio d’Aspio the Austrian attack made no headway at first, the Cagliari Bde. and the Alpini holding firmly to their positions, but in the end the first line was occupied, the Italians retiring to the main line of defence, which ran from Monte Maggio by Campomolon to Spitz Tonezza. The Italian right was strongly attacked, and demolishive attacks by the Austrians in the Val Sugana were readily repulsed. Cadorna transferred his staff from Udine to Thiene on May 16, and next day he found a critical situation on his left. The Roma Bde., or rather what was left of it, was coming back in the Vallarsa, and Col Santo had been evacuated by the territorials, while the command of the sector had lost touch with the Alpine battalions. In the centre, too, the situation was bad. The Campomolon line was being strongly attacked, and showed signs of yielding, though reinforcements from the 9th Div. had been promptly dispatched. The line had been insufficiently prepared, and was being methodically knocked to bits by the very heavy fire of the Austrian big guns. But the chief danger lay on the left, where there was little to stop the Austrian advance between the Vallarsa and the Val Terragnolo. Here, too, practically nothing had been done to prepare the reserve positions, and owing to a mistaken order the retiring troops had not occupied Monte Pasubio, the key position now that Col Santo had gone. The Volturno Bde., of the 10th Div., which was on its way to reinforce another threatened sector, was diverted to the more critical point. A battalion was hurried up in motor lorries, and marched up to Pasubio, and the Alpini of the X. Bde. were diverted to a night attack, in the nick of time. Two hours later the first Austrian patrols appeared and were quickly repulsed. The rest of the Volturno Bde. followed, and held the position till they were relieved and reinforced by the 44th Division. By May 19 the Austrians were attacking hard along the line to which the Italians had retired, from Coni Zagna and the Passo di Buole to Pasubio, and the Campomolon line had gone. On May 18 the Austrian attacks, supported by very violent artillery fire, broke the front of the Ancona Bde., and the rest of the 35th Div., threatened on the flank, withdrew during the night. The retreat was covered by the Victoria battalion of Alpini, who fought a gallant rear-guard action, and a strong counter-attack by the group of Alpini from Marostica checked the Austrian pursuit. The 35th Div., with its reinforcements from the 9th, came back to the line Monte Aralta (south of the Posina)—Monte Cimone—Barzago, but the Italian centre was now broken. There were gaps both to the right and left of the 35th, though the Alpini were holding north of the Posina and the 27th Div. was coming up rapidly to the valley.

It was a critical moment for the defending army. The Austrian right was increasing the pressure against the positions west of the Vallarsa, and was collecting forces for the first of the long series of attacks against Pasubio, which was only lightly held. The 44th Div. was on its way to the front, but had not yet arrived, and a large number of the guns in this sector had been destroyed prematurely, in the belief that retreat was imminent. There was breathing space for a moment in the centre, but the Austrian left now came into action, Krautwald von Annan’s III. Corps being launched against the Italian 34th Division. Ample Italian reserves were now on the move, the XIV. Corps being en route to fill the gap between the 35th and 34th Divs. and reinforce the latter, but it was a race. Krauss blames the Austrian XX. Corps (Archduke Charles) for waiting till the guns could be brought up to support a new attack instead of driving through at once to Arsiere with all available troops. Perhaps a column, perhaps a strong force, might have pushed straight on to Arsiere and beyond; and if so, it might have gone hard with the Italians. The risk was not taken, and the short respite gave time to close the doors in the face of the invader.

The course of the battle, with the necessity of bringing up reserve divisions, led to a reorganization of the attacking forces, von Eben taking command of the left wing and Dankl of the right. In the Vallarsa and Pasubio sector the attack developed strongly. The advance along the ridge from Zagna Torta, which had been throughout stubbornly contested by the Italians, had been definitely checked by a regiment of the Taro Bde. at Malga Zagna, and the Austrians endeavoured to break through by coming up from the Vallarsa against Passo di Buole. At the same time Pasubio was assailed with the utmost determination. Farther north the Archduke Charles was waiting for his guns and for reserves, and between him and the III. Corps Kirchbach’s I. Corps was coming into action. The III. Corps was now hammering against the Italian 34th Div., whose position was precarious, and although Etna’s Val Sugana troops had held their own against various tentative attacks, they were withdrawn to the second line of defence.

Although the wings were holding, the situation in the centre was very grave, and Cadorna considered that if the Austrians were able to concentrate on the weak spot and keep up the impetus of their attack they might succeed in breaking through to the plain. On May 20 he went to Udine, and after consultation with the Duke of Aosta and Frugoni gave orders for the concentration of a reserve army in the Venetian plain. The movement of these troops, which were placed under the command of Frugoni, began on the night of May 21, by road: the railways were occupied with the transport of I. Army reserves (the X. Corps and various other units), and were not available till May 26. The first four corps of this reserve army (the V.), which were made up of units drawn from the II. and III. Armies, were ready on June 2.

Meanwhile the Austrians were continuing their advance in the centre, but the situation on the Italian left was improving. By May 22 the 44th Div., commanded by Gen. Bertotti, was in solid possession of both sides of the Vallarsa road and of Pasubio, and in touch with Ricci Armani on its left. The latter was holding firmly on Coni Zagna and the Passo di Buole, and neither here nor on Pasubio could the repeated attacks of the Austrian right make any impression. On May 24 a desperate effort was made to storm the Passo di Buole and Pasubio, but the Sicilia and Taro Bdes., who held the Zagna ridge, and the right wing of the 44th Div. on Pasubio, repulsed the onset with very heavy losses. The columns attacking Passo di Buole suffered heavily from the flanking fire of the 44th Div. guns in the Vallarsa. The left wing of the division was not attacked in force and Bertotti was able to assist Ricci Armani with his guns. Next day the attack was renewed, heavy columns coming up the slopes against the Passo di Buole, only to be thrown back, broken and decimated, one brigade being practically destroyed. The last attack in force was on May 30, when repeated efforts were made to storm the Pass, in vain. Although further attacks were made after this date the fighting never again reached the same intensity. The Austrian losses had been too heavy for them to continue their attacks in mass, and their attempts to advance in open formation were easily checked.

The importance of the defence at the Passo di Buole can hardly be over-estimated. If the Zagna ridge had fallen, the effect upon the Pasubio position, already a salient, would have been more than serious, and upon the holding of the Pasubio lines depended the maintenance of the positions held by the right wing of the V. Corps. On May 22, following upon the retreat from the Campomolon line, the troops holding the lines in the Seven Communes had been detached from the V. Corps, and the command in this sector had been given to Gen. Lequio, who had come from Carnia. On May 24 the rest of the V. Corps had for the most part retired beyond the Posina or down the Astico to the plain, and had been replaced by the 27th Division. If Pasubio went, the line south of the Posina was turned, and the Austrians had a new route to the plain by the Valli dei Signori, as well as the opening they were now making for, by the Lower Astico. Pasubio was the key of the situation, and the Austrians hammered unceasingly against Bertotti’s right wing. The guns never ceased, and a long succession of attacks broke in vain upon the Italian lines. The Austrian infantry advanced along the great ridge from Col
ASIAGO

Santa; they came up from Anhebani and Chiesa in the Vallarsa and from the Val Terragnolo by the Borcola Pass. Bertotti had four brigades under his command, including the remains of the Roma, and the 6th Group of Alpini, and he changed his troops continuously. The conditions were very hard, and frostbite was responsible for many casualties. But the snow still lay deep on the high ridges, but the spirit of the troops was proof against all trials, and it was against the iron lines of Puslibio that the Austrian offensive came to failure.

North-east of Puslibio, along all the rest of the mountain front to above the Val Sugana, the Austrians gained notable successes. The gap between the 33rd and 34th Divs. had been filled by the arrival of the 30th Div. (XIV. Corps), and the 28th was on its way, the three Divs. (34th, 30th and 28th) now forming the XIV. Corps under Lecquio. But von Koeves's attack had broken through the Italian line in the Seven Communes. For two days the Italian 34th Div. had fought off the attacks of the Graz (III.) Army Corps. On May 21 the order was given to retire to the line Monte Verena—Cima di Campolongo, and the stay on this line was short. Contact was lost with the left wing of the XVIII. Corps in the Val Sugana, and the Austrians turned the right wing of the division by a bold and skilful advance by way of the Porta Manazzo. A retreat was ordered to the Portule line, east of the Val d'Assa, which was supposed to be the principal line of resistance. The 34th was unable to stand on this line. Owing to an error in the transmission of an order the Alpine troops who were holding the positions of Cima Undici and Cima Dodici retreated before the Austrians attacked, and uncovered the flank of the division, while on the same day (May 25) the attacking forces succeeded in occupying the important position of Corso di Campo Verde (6,815 ft.). Next day the attack was continued from north and west, and the Italians were swept off the whole line between the Val d'Assa and the Val Galmarara. A number of prisoners and guns were lost, and prospects looked black for the Italians, though the 28th Div. was now coming into action. On May 26 the situation was such that Cadorna thought it wise to make further preparations for a step which he had already considered and planned—a retreat from the Isonzo and Cadore. He ordered all heavy artillery not absolutely necessary for defensive purposes, and all stores beyond the minimum required for immediate supplies, to be withdrawn from the Isonzo front and brought south of Treviso, behind the Silo. With the possibility of a general retreat in view, it seemed necessary to withdraw the heaviest impediments in good time. Although Cadorna believed that he could hold back the Austrian attack, he had no intention of omitting any precautions.

The Italian position looked unfavourable and worse was yet to come, but Cadorna's confidence was justified. The impetus of the Austrian attack was dwindling. The effort had been great, and losses had been very heavy. The attacking divisions were beginning to lose their offensive value, and the reserves were insufficient. By May 27 Conrad had been compelled to ask Falkenhayn to send to Italy a division of the Austrian XII. Corps, which belonged to Prince Leopold's Army Group. By the end of the month Cadorna was holding his own, although both Dankl and von Koeves were still making progress.

On May 27 Dankl's left wing was down in the Asiago valley and close upon Arsiere, and on the following day his centre crossed the Posina in force and attacked the Italian 27th Div. on the southern slopes of the valley. Still fighting took place beneath Soglio di Campiglia and Pria Forà, and the Italians withdrew to the mountain line which had been hastily prepared from Forin Alti by Monte Spin to Pria Forà. Retiring on the night of May 29, the troops that were to fall back upon Pria Forà lost their way in the dark and kept too far south, halting on Monte Clove, the ridge that joins Pria Forà to Monte Novegno and Monte Brazome. At dawn the mistake was realized, but the quick-following enemy were already in possession of Pria Forà, which is almost impregnable from the south. A desperate attack failed to retrieve the error, and Pria Forà remained in possession of the Austrians.

The line now held by the Italians (27th and 9th Divs.) was the last bulwark defending the plains in this sector, and both here and across the Astico the Austrians made a great effort to break through. The bulk of the 30th Div. was slowly pushed back across the Val Canaglia, in spite of a prolonged and gallant resistance by the Grenadiers below Monte Cengio. Although the Grenadiers finally lost the summit of Cengio, they held on to the lower slopes above Schiri, and Dankl was unable to make headway in the valley, while the right of the division was swung back to the western slopes of Monte Pau. For a long fortnight Dankl hammered at the line south of the Posina and east of the Val Canaglia, but could not gain a yard. On June 1 the 27th Div. front was reduced, the remade 35th Div. under Gen. Petitti di Koreto coming into line in the Novegno sector, and the 9th (Gen. Gonzaga) taking both sides of the Astico valley. Dankl's attack was specially directed against two points: Monte Puslibio, where troops of the VIII. and XV. Corps were thrown again and again to the attack, and the Novegno sector, where the Archduke Charles concentrated his main effort against Petitti's troops. The attack was bound to follow this direction. It has been suggested that the Archduke should have pushed straight for the plain, down the Lower Astico valley. If ground had been gained here it would have been useless. The weak point of the Austrian position was that their successes were gained on a constantly narrowing front. The wings of the Italian line had held firm, and it was above all necessary to gain room south of Arsiere. On June 2, 3, 4 and 5 massed infantry attacks were delivered south of the Posina, but no impression was made on the Italian lines.

Meanwhile von Koeves had been pushing back the Italians in the Seven Communes. On May 28 Asiago was evacuated, and farther north the 34th Div. retreated from east of the Galmarara across the parallel valleys of Nos and Campomulo. Farther north again the Austrians gained ground on the Marcesina plateau and so came within 4 m. of Primolano in the Val Sugana, a point well behind the Italian lines in the valley. But communications were nearly impossible here, and von Koeves had to make his effort more to the south, narrowing still further the front of attack. From Arsiere to gain ground in the Val Sugana had failed on May 26, and no other attempt was made in this sector, for which, in fact, there were no more troops available.

By June 2 Cadorna's V. Army was assembled in the Vicentine plain, and on June 4 Brusiloff broke through at Lutsk. The first news of the Russian attack did not perturb Austrian headquarters, though Gen. von Cramon was taken aback. Conrad thought that his line in the east was firmly held. In a few days the situation was changed altogether. But even before the news of the disaster had reached Bozen it was clear that the operation to gain a little more ground. After four days' heavy fighting across the Campomulo valley and towards the head of the Val Frenzea, on the evening of June 8 the Italian right on Monte Castelgomberto was forced to retire from the summit of the mountain, but no ground was lost towards the Val Frenzea. The Austrians were only 3 m. from Valstagna, low down in the Brenta valley, but they had shot their bolt.

In spite of the news from the Russian front the attack was continued, south of Asiago and south of the Posina, for 10 more days. Here were the shortest routes to the plain, and here the Austrians had been able to bring up their guns in sufficient numbers. The Archduke Charles continued his attacks against Petitti's division, and Kirchhbach's I. Corps made a great effort against the Italian positions south-west of Asiago. With the arrival of reinforcements the Italian line was once more rearranged, Gonzaga's 9th Div. passing to the X. Corps command (Gen. Grandi), the second division of the Corps (the 20th) lying in reserve, while the XXIV. Corps (Gen. Secco) came in between the X. and the XIV., its front-line division (the 32nd) taking over the gallant Grenadier Bdc., which had suffered very severely in the Cengio and Val Canaglia fighting, and the 33rd being held in second line till June 7, when it replaced the 32nd.
The command of the 30th Div. received two fresh brigades, Forli and Piemonte, on June 7, after a furious attack which gave the Austrians a footing on Monte Lemerle, and for 10 days the division fought off repeated infantry attacks. On June 13
the Austrian command issued an army order saying that Monte Lemerle would fall in two days, and that only three mountains blocked the way to Milan. For four days the Austrians attacked, making a last effort on June 18, when 20 battalions were sent in against the Lemerle-Magione bottleneck in an attempt to wedge between the Italian 30th and 33rd Divisions. The attack failed completely, thanks to the heroic defence of the Forli Bde., and the admirable work of the Italian field guns. To the east of the Val Canaglia the result was the same, the Liguria Bde. of the 33rd Div. holding their ground against repeated infantry attacks, backed by greatly superior artillery fire. Weakness in artillery was Cadorna's main preoccupation for many days. In the early stages of the offensive the I. Army had lost over 400 guns, including over 120 heavy and medium calibre. The first reinforcements had to be sent to strengthen the left wing. The next urgent need was for Asisio, where the 35th Div. was reinforced by guns sent up by Enego, and in the Lower Astico, to stop the Archduke Charles. The troops between Asisio and the Val Canaglia had very few guns, and even when sufficient artillery reinforcements were available Cadorna preferred first to strengthen his wings for the counter-attack that he was already preparing.

The Archduke Charles made his last infantry attack on June 14, at the close of three days' heavy fighting for Monte Ciove, in which the Cagliari Bde. withstood repeated attempts to break through at this vital point. The rest of the division was equally staunch, and the troops were helped by the example of their commander. Petitti had established his divisional command far forward on Monte Novegno, where it came under the heaviest shell-fire. All around the ground was pocked with shell-holes; several times telephonic communication was interrupted, so that orders had to be given by megaphone or bugle; on June 12 the majority of the divisional staff was put out of action by a direct hit. The command was obviously too far forward, but it was the knowledge of their general's presence, amid the same dangers as themselves, that kept the men firm in their places in spite of the long strain and terrible losses. The Cagliari Bde. lost two-thirds of its strength, and other units suffered nearly as heavily.

The last Austrian blow was struck on June 18, south of Monte Lemerle, in vain, when already the first move of the Italian counter-attack had taken place. Cadorna had declined to draw upon his new V. Army prematurely, as he wished to keep a "mass of manœuvre" in hand against the possibility of a break-through by the Austrians; but by June 2 he felt himself master of the situation. He had 12 divisions in the plain under Frugoni, and the attack was already slackening. The XXXIV. Corps was detached from the V. Army and sent to the south of the Asisio plateau, as already described, and orders were given to the XX. Corps to concentrate north of the Val Frenzela and prepare to attack the Austrian left. The attack was not to be made until the position in the centre was assured, and it was to be accompanied by an advance from Pasubio upon Col Santo. On June 13 Cadorna took counsel with his generals, who were nearly unanimous in expressing a grave view of the situation. Bertotti was confident that he had the measure of his adversary in the Pasubio sector; the others felt themselves still hard pressed by the Archduke Charles and von Koller's corps, and mention of both in their communiqué. In his own estimate of the situation, and confirmed the order for an attack by the XX. Corps, which came into action between the XIV. and the XVIII. The Alpine troops on the right of the Corps pushed forward quickly and occupied various important heights on the northern rim of the Asisio plateau. But the Austrians were now getting ready to go-out of the salient and back to a strong line which they had already selected.

Attacking on May 25, all along the line, the Italians found the invaders in retreat. In some places rear-guards were left to cover the withdrawal; in others the Italians, advancing cautiously, in some cases too cautiously, found no resistance until they had made considerable progress over the difficult ground. The counter-offensive, which was to be directed against the two sides of the Austrian salient, was never fully developed, for it was anticipated by the Austrians, who withdrew skillfully and in good order. The line chosen by Krauss ran from south of Rovereto in front of Col Santo to the Borcola Pass; thence along the rim of the Arsiere plateau, north of the Posina and east of the Upper Astico; thence north-eastward across the Val d'Assa to Monte Moscingh, and thence northward to the old frontier. This gave a very strong defensive line, with ample depth east of the Upper Val d'Assa, which therefore remained entirely in Austrian hands, a useful line of communication in any case, and an invaluable opening in the event of further offensive action.

Cadorna was especially anxious to reach the Portule line, and he reinforced the troops in the Seven Communes (now under the command of Gen. Mambrotti, who had replaced Lequi) by three divisions of the V. Army, now available as a reserve on the understanding that they were not to be employed unless the situation should develop favourably. But the Austrians had a great advantage in position, and used it well. The Italian attacks, handicapped by the limitation imposed, made little headway, though they prevented the dispatch of Austrian units already under orders for the eastern front. Farther south, repeated attempts were made to retake Monte Cimone, which the Archduke Charles had wished to abandon, but which Krauss insisted should be held. Although Alpine troops gained a footing north of the summit they were subsequently blown off by a mine, and Monte Cimone, which rises sheer-sided, like a vast battlefield, between the Astico and the Rio Freddo, completely dominating the Arsiere basin, remained in Austrian hands.

Cadorna relinquished the idea of a big counter-offensive as soon as he found a resistance which could only be overcome by long preparation and the use of artillery in mass. The fighting which took place after the first week in July was all directed to masking his intention to attack with all speed upon the Isonzo.

The Austrian attempt to break through ended in definite failure and even its secondary object, that of preventing the Italian offensive on the Isonzo, was not attained. But the attack was well planned, and conducted with skill and determination. The Austrian artillery fire was very destructive; the transport was admirably organized, and worked very well in spite of the great difficulties of the terrain; the infantry, most of them picked troops, fought with high courage and determination. Failure was due to the fact that the attack met with a resistance that went beyond Conrad's calculations. In the first days of the attack some Italian units, badly placed and badly handled, showed only a feeble opposition. In the weeks that followed, the men who held at Passo di Bucole and on Pasubio, south of the Posina and east of the Val Canaglia and in the Seven Communes, outnumbered at first and always outgunned, completely broke up the attack that had begun so well. The casualty list shows the nature of the fighting. The Austrian losses were estimated at over 100,000 men; the Italian figures, up to the end of the counter-movement, are: 35,000 killed and 75,000 wounded, with 45,000 prisoners, many of whom should be counted among the wounded.

The success of the Italian resistance was primarily due to the power of the Italian soldier, when properly handled, to take on any amount of punishment. In his own estimate of the phase of the battle the Italian leadership was at fault, and on this point much controversy has taken place, one party blaming Cadorna and another Brusati. In view of the facts and figures it seems impossible to avoid the conclusion that the chief responsibility lay with Brusati. On his own showing he had forces that he considered sufficient, and perhaps they might have been if they had been more skilfully disposed. Brusati had failed to realize the necessity of defence in depth, or the essentials of a good defensive line, but a grave error still was
his neglect in regard to the preparation of second-line positions.

It was serious enough that the positions indicated by Cadorna in the early days of the war had not been prepared. Much more serious was Brusati's report that these lines were in a satisfactory state of efficiency, when in fact they were largely untouched. Cadorna relied upon Brusati's report, and when, at the end of April, he inspected the positions himself, the enemy attack was daily expected, and it was too late to effect more than slight modifications. In reply to the common criticism that Cadorna ought to have inspected the lines earlier, the answer is that he was fully occupied from Oct. to Dec. 1915 with his Isonzo offensive, and that from Dec. 10 to April he was on the part of the line between the Val Lagarina and the Val Sugana, under deep snow. After the initial disasters, which can scarcely be laid at his door, Cadorna showed the qualities of a great leader. He was quick to grasp the situation, and effective in the measures he took to cope with it. And he realized, when the outlook seemed bleakest and all his generals were against him, that the impetus of the enemy attack was failing and that he could control the situation.

'It has been suggested that Cadorna should have pursued his counter-offensive and left the Isonzo alone. There were always be adherents of the fallacy that Italy should have attacked through the Trentino, though they are in the main confined to those who do not know the country, or those who have no experience of modern war. With these, presumably, no argument would serve. To those who maintain that Cadorna should have sacrificed everything in order to improve his defensive position in the Trentino sector, it may be answered that the line on which he stopped (or rather the modification of it necessitated by the retreat after Caporetto), properly prepared, backed by other lines in sufficient depth, and adequately served by new roads, was maintained until the end of the war. In refusing to waste men in attempting more than was necessary Cadorna took the right decision, and won a notable success.

(W. K. McC.)

ASIA MINOR (see 2,757).—With the Turkish revolution in 1908 and the Armenian massacres of the following year began a series of radical changes in the political division of Asia Minor; nor was it yet possible in the summer of 1921 to foresee the end. In the Italo-Turkish and Balkan wars of 1911–3 the Ottoman Empire lost islands on the coast of Asia Minor. The World War of 1914–18 saw the end of the empire itself, and the substitution of a Turkish state confined almost wholly to Asia Minor. The occupation of considerable territory by Greece in the region of Smyrna became effective, and at the same time the Turkish Nationalist Government with its capital in Ankara offered successful armed resistance to the full execution of the Treaty of Sèvres. These events were accompanied by further Armenian massacres on the greatest scale. Asia Minor as a geographical entity was therefore in 1921 in no sense any longer a political unit.

ASKWITH, GEORGE RANKEN ASKWITH, 1ST BARON (1851– ), English lawyer and civil servant, was born at Morley, Yorks, Feb. 17 1851, and was educated at Marlborough and Brasenose College, Oxford. He was called to the bar in 1876 (K.C. 1903), and in 1890 was one of the counsel in the Venezuelan arbitration case. In 1909 he entered the railways section of the Board of Trade as assistant secretary, and in 1909 was appointed comptroller-general of the Commercial, Labour and Statistical Departments of the Board of Trade. He acted as arbitrator in many industrial disputes, and in 1911 was created K.C.B. in recognition of his valuable work in that capacity. In 1911 he became chairman of the recently constituted Industrial Council, in 1912 he made a special report for the Government on the Canadian labour laws, and in 1913 was appointed chairman of the Government Arbitration Committee under the Munitions of War Acts, holding this post till 1917. On the Committee of Production he did important work for the Government. In 1916 he retired from his position as chief industrial commissioner, and was raised to the peerage. His wife, whom he married in 1908, was a daughter of Archibald Peel, nephew of the statesman Sir Robert Peel, and the widow of Maj. Henry Graham (d. 1907). During the World War she was an active and energetic member of the Central Committee on Women's Employment, and was created C.B.E. in 1918.

ASQUITH, HERBERT HENRY (1852– ), English statesman (see 2,769), had been confirmed in power as Prime Minister by the general election of Jan. 1910, but the political situation resulting from it was still one of unexampled difficulty (see ENGLISH HISTORY). On several occasions during the ensuing parliamentary session, he put up importunate questioners, with regard to the policy of the Ministry, by saying that they had better "wait and see." The phrase was remembered, and was subsequently used by his critics. In subsequent years, especially during the World War, as a compendious description of what they considered to be the procrastinating attitude of the Prime Minister and his Government. But there was no procrastination in Mr. Asquith's attitude in the autumn, as soon as the conference arranged between the opposing political leaders on the constitutional crisis had definitely failed. He and his Cabinet at once took decisive measures to get it settled in their own sense. On Nov. 15—the day Parliament reassembled for its autumn session—they advised the Crown to dissolve, but only on the understanding that " in the event of the policy of the Government being opposed by a large majority of the House of Commons His Majesty will be ready to exercise his constitutional powers, which may involve the prerogative of creating peers, if needed, to secure that effect shall be given to the decision of the country." The King reluctantly consented, and the dissolution was announced on Nov. 18; but the terms of the understanding which had been arrived at between the Crown and its advisers were not revealed till the crisis in the following summer. The second general election of 1910 was held in Dec.; and the verdict of the preceding Jan. was almost precisely confirmed.

Having, with the aid of Labour and the Nationalists, who were both thoroughly with him on the constitutional issue, a clear majority of about 120, the Prime Minister went straight ahead with the Parliament bill, which had two main objects: to take from the Lords all power of either rejecting or amending a Money bill, and to provide that a bill passed in three successive sessions by the Commons should become law without the Lords' assent. He carried the second reading in March with the closure, defeated the stubborn resistance of the Unionists in committee by aid of the "kangaroo" closure, and obtained the third reading on May 15 by an unbroken majority of 121. He did not conceal in the debate that the first use to which the new power conferred by the bill on the Commons would be put was to pass the Irish Home Rule bill, followed by the rest of the controversial Liberal programme. When the Lords, after allowing the second reading to pass, introduced by an enormous majority an amendment (amongst others) providing for the submission to a popular vote of certain fundamental measures, he forthwith announced, in a letter to Mr. Ballour on the day (July 20) on which the amended bill was read a third time in the Lords, that the Government would ask the House of Commons to disagree with the amendments, adding—:

In the circumstances, should the necessity arise, the Government will advise the King to exercise his prerogative to secure the passing into law of the bill in substantially the same form in which it left the House of Commons; and His Majesty has been pleased to signify that he will consider it his duty to accept and act on that advice.

This, the first public announcement of the King's consent to the creation of sufficient peers to pass the bill, produced an explosion among the Opposition; and the Unionist hotheads, among whom Lord Hugh Cecil and Mr. F. E. Smith (afterwards Lord Birkenhead) were conspicuous, shouted "Traitor" at Mr. Asquith in the House of Commons, and refused to let him deliver the speech in which he was to explain his policy. But he had effected his object of dividing the Unionist party; and eventually a sufficient number of peers followed their leaders in bowing to force majeure and allowing the bill to pass rather than risk the degradation of their House by an unlimited creation (see ENGLISH HISTORY). Mr. Asquith welcomed the vote of censure which the Opposition promoted in the House of Commons; gave
an account of the understanding entered into with the King before the last dissolution; pointed out that the Parliament bill had been twice approved by the electorate in principle and once in its substantial details, that there was no alternative Government possible and no responsible minister at its head would advise another general election with any hope of a different result.

The vote of censure was repelled by the usual Government majority; and, though Mr. Asquith's course had profoundly exasperated his opponents, the direct and unflinching manner in which he had carried his policy through raised his own parliamentary reputation and strengthened his own fundamental convictions. Having cleared the way by the Parliament Act, which he described as "a landmark in political development," the Prime Minister pressed forward, by frequent use of the closure, in the three following sessions—of 1912, 1913, and 1914—the two bills on which Liberal partisans had specially set their heart, the Irish Home Rule bill, and the Welsh Disestablishment bill. Of the Home Rule bill he took the main charge himself, advocating it as being strictly in accordance with the spirit and tendency of imperial development. In July 1912 he went across to Dublin, and at a great Nationalists meeting he made the Intention of the Government to be to unite the English and Irish democracies. While speaking as a rule respectfully of Ulster, and offering to strengthen the safeguards for her welfare contained in the bill, he resolutely refused, till the autumn of 1913, to consider the possibility of her exclusion even for a time. But after the signing of the Ulster covenant, the enrolment and drilling of thousands of volunteers, and the establishment by Sir Edward Carson of a "provisional Government"—with none of which operations did he think it wise to interfere—he realized that, unless Ulster were placated, the new Home Rule constitution could not be set up without something like civil war. Accordingly, at Ladybank, in Oct. 1913, he said that he desired a settlement by consent, and invited a frank interchange of views; but he stipulated that there must be a subordinate Irish Parliament and an executive responsible to it in Dublin, and that no insuperable bar must be erected to Irish unity. In pursuance of this policy, he announced early in the following March, when moving for the third time the second reading of the Home Rule bill, that the Government would propose that any county in Ulster might vote itself out of the bill for a period of six years. This did not suit the Unionists, who demanded that Ulster should be omitted till Parliament otherwise ordered. At this moment occurred the incident at the Curragh, where military officers, when questioned on their views, offered their resignations rather than undertake military operations against Ulster. The War Office prevailed on them to withdraw their resignations by an assurance that there was no intention of crushing political opposition to Home Rule; a kind of bargain which the Liberal party and the Liberal press vehemently condemned and the Government itself repudiated. General Seely, the War Minister, immediately resigned, and Mr. Asquith met this situation by himself assuming the seals of the Secretary of State. He laid it down that it was not right to ask an officer what he would do in a remote and hypothetical contingency, still less could it be right for an officer to ask a Government to give him any assurance. Such a claim, once admitted, would put the Government and Parliament at the mercy of the military. He would administer the War Office, he told his constituents, in the spirit of Chatham, who said, "The army will hear nothing of politics from me, and in return I expect to hear nothing of politics from the army. These events raised passions on both sides, but the Prime Minister refused to be moved from his offer. The amending bill was introduced in the Lords, but was transformed by Unionist amendments into one for the permanent exclusion of Ulster—a change which the Government refused to accept. Mr. Asquith then, in a final effort for settlement by consent, risked his popularity with Radicals and Labour men by advising the King to invite the leaders of the English and Irish parties to a small conference at Buckingham Palace. When this conference, too, after a four days' session, failed on July 24, he was relieved of his difficulty as to the next step by the outbreak of the World War. In no other domestic measures of his Government during this period had Mr. Asquith taken so prominent and personal a part as in the Parliament Act and the Home Rule bill. But he was, of course, mainly responsible for the drastic use of the closure, in various forms, without which, indeed, it might have been impossible to get the most contentious of the Government bills through at all. He was active in efforts, first to aver, and then to compose the great coal strike of the early spring of 1912. From the third week in Feb. till the middle of March he was in constant touch both of the miners and the owners, and when conciliation failed he finally introduced and passed a Coal-mines (minimum wage) bill, which brought about a settlement at Easter. With the transport strike in the summer of 1912 he declined to interfere. His various franchise bills came to naught owing to the difficulties introduced by the claim of a large body of women to the suffrage. Though he was prepared to leave that thorny question to be decided freely by the House, he was himself, unlike the majority of his colleagues, opposed to giving women the vote, and was, accordingly, in the last few years before the World War, frequently subjected to rudeness and insult by the militant section of suffragists. While in the domestic legislation which he promoted, especially after he was compelled by his own party's electoral losses in 1910 to rely largely on Nationalist and Labour votes, Mr. Asquith leaned to the Radical side, in foreign and imperial policy and in matters of defence he acted up to the Liberal Imperialist principles of which he had been the standard-bearer while in opposition. He took a keen interest in his duties as chairman of the Committee of Imperial Defence; he strongly supported Lord Haldane in his efforts to make the army more efficient as a striking force; he steadily backed first Mr. McKenna, and afterwards Mr. Churchill, in their extensive programmes, which increased the navy estimates from some £12,000,000 in 1908 to nearly £52,000,000 in 1914; he was the first Prime Minister to preside in a colonial, now become an imperial, conference; and while, owing to his Free-Trade principles, he rejected colonial or imperial preference, he pushed forward organized schemes for imperial defence. The experience of the World War, however, seemed to show that he made a mistake in accepting the Declaration of London. In foreign affairs he gave consistent and strenuous support to Sir Edward Grey, who had continued to develop the national policy previously laid down by Mr. Haldane and Lord Lansdowne. The war was fully recognized by the Opposition, who supported him on these questions against the sporadic attacks of Radicals, Nationalists, and Labour men. Whenever Mr. Asquith had to speak to the world as the nation's mouthpiece, in Parliament or at Guildhall, he produced a weighty impression by his clearness and candour in statement, and his dignified and sonorous phrasing.
he himself moved, on Aug. 5, the day after war had begun, the first vote of credit for £1,000,000,000, maintaining that "the war has been forced upon us." The fight was, first, to fulfil a solemn international obligation; secondly, to vindicate the principle that small nationalities were not to be crushed, in defiance of international good faith, by the arbitrary will of a strong and centralizing power. No matter how hard, how ever desperate, into a great struggle with a clearer conscience and a stronger conviction that it was fighting for principles vital to the civilized world.

In response to a public demand, peremptorily voiced in the press, he now brought Lord Kitchener, who was on the point of starting back, after a brief visit home, to resume his duties as British agent in Egypt, into the Cabinet as Minister of War, surrendering to him the seals which he had held himself for over four months, and he gave him a wide discretion in conducting the war by land. The conduct of the war remained ultimately with the Cabinet, but its day-to-day direction was practically carried on by Mr. Asquith, Lord Kitchener, and Mr. Churchill, with the assistance of their technical advisers. As Prime Minister, too, Mr. Asquith must be accorded his full share in the important measures taken by the Cabinet at this time, such as the financial moratorium, the prompt despatch of the expeditionary force, the enrolment of Kitchener's army, the glad acceptance of colonial help, the decision to bring over native troops from India, and the Defence of the Realm Act. He, however, strained his relations with the Unionists by determining to pass the India Rule and Welsh Disestablishment bills under the Parliament Act, only providing that neither should come into effect till after the war, and that special provision should be made for Ulster, which should in no circumstances be coerced. He undertook a series of speeches in the autumn, notable alike for patriotic vigour and for lofty eloquence, in order to educate the nation as regards the objects and necessity of the war, and to stimulate recruiting. At the Guildhall on Sept. 4 he said that this was not merely a material but a spiritual conflict, and recalled how England had in the Napoleonic Wars responded to Pitt's dying appeal the war had been won. The conduct of the war, he said, on Sept. 18, he said that the German creed of material force was a pure blind philosophy, and that, while the British task might take months or years, the economic, monetary, and military and naval position was encouraging. At Dublin, on Sept. 25, he appealed to Ireland to take her due share in a war which was being fought in the interests of small nations. At Cardiff, on Oct. 2, he revealed the fact that, in 1912, the Cabinet had formally notified the German Government that Great Britain would not make nor join in any unprompted attack on Germany," but that Germany had demanded in response a British pledge of the same, and that if she were not given a pledge the War Cabinet, of course, Britain could not possibly give. He finished up this series of orations by a resolute speech at Guildhall on Lord Mayor's day; when he told the city that it would be a long-drawn-out struggle, but that England would not sheathe the sword until Belgium had recovered all and more than all that she had sacrificed, until France was adequately secured against the menace of aggression, until the rights of the smaller nationalities were placed on an unassailable foundation, until the military dominion of Prussia was fully and finally destroyed. On Nov. 25 he formed a war council, consisting of the Chancellor, the Exchequer, the Foreign Secretary, the Indian Secretary and Lord Haldane, in addition to Lord Kitchener, Mr. Churchill, and himself; but the main responsibility still rested on the last three, and the naval and military experts attended in a somewhat undefined position.

As the fervour of the early months of the war died away, many troublesome questions embarrassed Mr. Asquith and his Government. Besides the anxious problem of the Dardanelles expedition, he had to consider whether the system of compulsory service, hateful to the traditions of the Liberal party, had not become inevitable; how to eradicate spying, and to what extent to intern aliens; how to deal with the problem of the liquor trade and traffic, which seriously interfered with necessary production; how to prevent the occurrence during war of industrial disputes, which frequently broke out in the first half of 1915. Drink and strikes had a close bearing on the problem which became specially urgent in April, the absolute necessity of an enormous increase in munitions of war. The Times revealed the perilous shortage at the front; Mr. Lloyd George dillated upon it in the House; but Mr. Asquith, in Cabinet, at Newport on June, and in April, which was mainly devoted to emphasizing the importance of matériel in this war and to encouraging miners, shipbuilders, engineers, iron workers, and dockers to further efforts, raised a storm of criticism by denying that the operations in the field had been crippled because of a want of ammunition.

The uneasiness in the country immediately increased, and there was a pronounced demand for broadening the basis of Government. On May 12 Mr. Asquith repudiated the idea that any such step was in contemplation; but a week later, the quarrel which had developed between Mr. Churchill and Lord Fisher at the Admiralty convinced him that there must be a change, and he invited the Unionists, the Labour party, and the leaders of the two Irish parties to join him in office, by forming a Coalition Ministry. From all whom he invited, but Mr. Redmond, he received acceptances, and he was able to find places in his new Cabinet for them without excluding any important previous colleague of his own, except Lord Haldane, whose German affinities had offended public opinion. He gained the services of many powerful men among the Unionists—Mr. Bonar Law, Lord Lansdowne, Mr. Balfour, Lord Curzon, Mr. Chamberlain, Mr. Long, Mr. E. Smith, Lord Haldane, Mr. Redmond, Lord Selborne, of Mr. Henderson and Mr. Brace from the Labour party; and of Sir Edward Carson, the Ulster leader. But he kept the premiership in his own hands, and retained Sir Edward Grey at the Foreign Office, and Lord Kitchener at the War Office. He explained his decision in the House of Commons in these words:

What I came to think was needed, was such a broadening of the basis of the Government as would take away from it even the semblance of a characteristic character. I have not demonstrated the possibility of a coalition altogether to the whole world, that after nearly a year of war, with all its fluctuations and vicissitudes, the British people were more resolute than ever, with one heart and one purpose, to obviate all distinctions and unite every personal and political as well as every moral and material force in the prosecution of their cause.

He emphasized the facts (1) that in the Coalition no surrender was implied of convictions on either side; (2) that there was no change in national policy, which was "to pursue this war at any cost to a victorious issue." His Coalition Government made a good start. He constituted a new Ministry of Munitions, presided over by Mr. Lloyd George, who had by this time impressed the public as being the most resolute and determined of his colleagues. The Prime Minister had invited Lord Northcliffe and Lord Selborne to intro-
ASQUITH, H. H.

was the third loss of a colleague which the Prime Minister had suffered since the Coalition. Sir Edward Carson, the Attorney-General, had resigned in the autumn owing to the muddles of ministerial policy in the Balkans, and Mr. Churchill because of his exclusion from the immediate direction of the war. All three became occasionally keen critics of their former colleagues, whose delays in this vital matter of universal service weakened and discredited them in the country.

Mr. Asquith took a further step early in 1916 in the direction of close cooperation between the Allies by attending along with Sir E. Grey, Lord Lloyd George, Lord Kitchener and Gen. Sir William Robertson, an Allied conference in Paris, representative not only of England and France, but of Russia, Italy, Japan, Belgium, Serbia, and Portugal. Thence he went on to Rome, where he visited the Pope, and made a speech in the Capitol declaring the solidarity of Italy, France, and England at that critical moment of the world's history; afterwards proceeding to the Italian headquarters, where he was received by King Victor Emanuel and Gen. Cadorna. Later, in June, he and his Government arranged an economic conference, also in Paris, which provided for greater measures of economic union between the Allies, for an exclusion of the national resources of Allied countries, and for economic protection against enemy trade "penetration" and "dumping" after the war. His special attention was claimed at the end of April by rebellion in Ireland, the most serious incident of which was the capture of a great part of Dublin for a week by rebels (see IRELAND). After the suppression of the rising by the troops and the prompt execution of the leaders, he appointed a commission of inquiry, and he himself visited Ireland and returned with a conviction that a united effort must be made to reconstruct Irish government. He appointed Mr. Lloyd George to negotiate and formulate suggestions. In the result he proposed a provisional settlement, for the war and 12 months after, on the basis of bringing the Home Rule Act with certain amendments into immediate operation, with the exclusion of six Ulster counties. To this Sir Edward Carson agreed, but Mr. Redmond objected to the amendments, and nothing was done. The negotiations lost Mr. Asquith the services of Lord Selborne as the rebellion had deprived him of those of Mr. Birrell, the Chief Secretary for Ireland.

The basis of his ministry was rudely shaken in the summer of 1916 by the loss of Lord Kitchener at sea. Lord Kitchener's place at the War Council initiated by Mr. Lloyd George, whose reputation for "getting things done" had been enormously enhanced by the energy with which he had organized the Ministry of Munitions. The attack on the Somme seemed to promise an end to the trench war, but after many weeks of most determined fighting the German line was not broken through; and in the latter part of the year Rumania was crushed. These events increased public dissatisfaction, which had been stimulated by half-hearted dealings with the blockade of Germany, with the food problem, and with the creation of an adequate aerial force; and public criticism was focused on Mr. Asquith, whose cautious phrase of six years before—"wait and see"—was frequently hung in his face. In the House of Commons two strong committees, one of Liberals and one of Conservatives, had been formed for the purpose of the resolute prosecution of the war and the keeping of ministers up to the mark. Mr. Asquith's speeches were always resolve enough; he promptly denounced any overtures of pacifists for a premature peace; but he was thought to be lacking in initiative, and to carry into the councils of war somehow what the attitude of an impartial Cabinet chairman weighing pros and cons and counting heads for a decision.

The Cabinet of 1915 left under Mr. Lloyd George, Government was continued with very little modification, save in personnel, under the Coalition; and the final authority remained with the Cabinet. It was felt that a small body, sitting daily, with power to act at once without reference, was essential for the proper conduct of the war. Mr. Lloyd George, the most active member of the War Council, by a letter on Dec. 1, demanded the establishment of such a body, with himself as one of its members, but without Mr. Asquith. He subsequently amended his proposal, giving Mr. Asquith a consultative membership and a power of veto. But it was clear that the effect must be to transfer the main conduct of the war from Mr. Asquith to Mr. Lloyd George. Mr. Asquith, who had consented to reconstruct his Government, refused Mr. Lloyd George's ultimatum; and on Dec. 5 Mr. Lloyd George resigned. Without him Mr. Asquith clearly could not carry on, and he himself resigned the same evening, being succeeded, after some complications, by Mr. Lloyd George. So ended a premiership which had lasted nearly nine years, and left an ineffaceable mark on English history. He carried into retirement his principal Liberal colleagues, including Lord Grey of Fallocon; and many tributes of regard and respect were paid him by the Unionists who had been his colleagues.

After his resignation Mr. Asquith took his seat on the front Opposition bench; but he disclaimed being in any sense a leader of Opposition, and affirmed that his one desire was to give the Government the benefit of whatever experience he had gained. He maintained this attitude throughout 1917, making resolute and helpful speeches in different parts of the country on behalf of the national war aims. In Parliament he rendered material assistance to the Ministerial machine till he saw that the services of women during the war had converted him to female suffrage. In 1918 he became rather more critical, and in particular called parliamentary attention to a letter in which Gen. Sir Frederick Maurice, formerly Director of Military Operations, challenged the veracity of ministerial statements. He moved to refer the general's charges to a select committee of the House, but was beaten on a division by 293 votes to 106. This action, taken during the period of the alarming German advance, marked a definite cleavage with the Government, which was widened after the Armistice by the conditions under which the general election was held in December. Mr. Asquith and those of his colleagues who had not joined Mr. Lloyd George, together with a considerable section of Liberal members, declined to pledge their support to the Coalition Government, and desired to be returned as independent Liberals. As the electorate was resolved that those who had won the war should make the peace and begin the reconstruction of the country, he and the whole of his principal colleagues lost their seats, and only 28 of his followers in all were returned. He did not come back to Parliament till Feb. 1920, when he was elected at a by-election for Paisley. This time he appeared as the leader of the Independent Liberal Opposition which had been momentarily led in his absence by Sir Donald Maclean; but his followers, though they had gained some seats since the general election, were still smaller in number in Parliament than the representatives of Labour. Possibly for that reason he was more active in the country than in Parliament, devoting himself to efforts for reviving the Liberal party. He maintained that the time was come to put an end to the Coalition and resume party Government. He attacked ministers for their departures from Free Trade, for their wasteful administration, and for their policy in Ireland. He strongly condemned reprisals in that island, and declared for Dominion Home Rule. For a time he seemed to be recovering his hold on the country; but in the last half of 1920 and in 1921 there was a setback. It was no help to his political position that Mrs. Asquith published in the autumn of 1920 a volume of very frank and indiscreet Reminiscences.

In 1918 Mr. Asquith himself published a volume of Occasional Addresses, delivered between the years 1893-1916, thus reminding the world that he was a worthy successor of a long line of scholarly and intellectual Prime Ministers, capable of treating with distinction and acceptance matters of the mind wholly unconnected with politics. The book contained, among other things, Rectorial Addresses to the universities of Glasgow and Aberdeen, a Presidential Address to the Classical Association, and a dissertation on "biography" read before the Edinburgh Philosophical Institution. The universities of the country duly recognized the claims made upon them by his scholarship. Besides being elected to the rectories, first of Glasgow and then of Aberdeen, he received honorary degrees from Oxford, Cambridge, Edinburgh, Glasgow, St. Andrews, Durham, Bristol and Leeds.
Mr. Asquith had four sons and a daughter by his first marriage, and he served in the same capacity by his second marriage. RAYMOND ASQUITH (1878–1916), had a brilliant career at Oxford, where he was a scholar of Balliol, gained a first class both in classical moderations and in lit. hum., won the Ireland, Craven, and Deny scholarships, and was 'first divided' in the B.A. examination in 1902 to a fellowship at All Souls. He went to the bar, and acquired a considerable practice, but when the World War broke out he at once sought a commission in the Army, and was called to action in France as a lieutenant in the Grenadier Guards. He left a widow and three children. The third son, ARTHUR MELLAND ASQUITH (1883–1929), distinguished himself greatly in the war, becoming brigadier-general and A.D.C. to the King. He was appointed in 1919 controller, Appointments Department, and member of council at the Ministry of Labour. The fourth son, CYRIL ASQUITH (1890–), followed his brother Raymond in his Oxford career. He was a scholar of Balliol, gained a first class both in classical moderations and in lit. hum., won the Hertford, Ireland, Craven, and Eldon scholarships, and was elected fellow of Magdalen. The war came just at the close of his undergraduate life, and he served in the army before being called to the bar in 1920. Mr. Asquith's daughter by his first wife, VIOLET, married his private secretary, Sir Maurice Bonham-Carter; his daughter by his second wife, ELIZABETH, married Prince Antoine Bibesco, for 16 years a member of the Rumanian Legation in London, and in 1921 appointed Rumanian minister to the United States.

ASTOR, WILLIAM WALDORF ASTOR, 1ST VISCOUNT (1848–1919) [see 2.993], died at Brighton Oct. 18 1919. He was in 1916 raised to the peerage, and in 1917 was created a viscount. He was born in New York May 10 1879, was educated at Eton and New College, Oxford. In 1911 he successfully contested the Sutton division of Plymouth as a Unionist, but vacated his seat in 1919 on succeeding to his father's peerage. He was chairman of the Government Committee on tuberculosis and of the State Medical Research Committee. During the World War he was inspector of quartermaster-general services, and in 1918 became parliamentary secretary to the Prime Minister. In Jan. 1919 he was appointed parliamentary secretary to the Local Government Board, and in the same year his eldest son, the foundation of the Ministry of Health in Aug. 1919. His wife, NANCY WITCHER ASTOR, born in Virginia May 19 1879, was the daughter of Chiswell Dahney Langhorne, an old Virginia family. She married in 1897 Robert Gould Shaw, of Boston, from whom she obtained a divorce in 1903, and in 1906 married William Waldorf Astor, Jr. When her husband succeeded to the viscountcy, Lady Astor, who had taken much interest in the local affairs of her husband's former constituency in Plymouth, was adopted there as Coalition Unionist candidate for the vacant seat in Parliament. She was elected by a large majority Nov. 1918, thus becoming the first woman to sit in the House of Commons.

ASTRONOMY (see 2.800).—This article is intended to cover the principal advances made during 1910–21 in all the departments of astronomy (including astrophysics) with the exception of the more technical results of celestial spectroscopy. Those investigations have been selected for discussion which appear to have had most conspicuous influence on the general current of ideas.

I. OBSERVATIONAL ASTRONOMY

The Sun (see 26.85).—By means of the spectroheliograph it is possible to obtain photographs of the sun in light of a single wave-length; we thus obtain a picture of the distribution of the matter which emits this wave-length, or a negative of the matter which absorbs it. In practice either calcium or hydrogen light is used, since these elements furnish spectral lines sufficiently isolated to give good results. The emission of a particular line depends on favourable conditions of temperature and density, and these will vary with the level in the sun's atmosphere. Thus the function of the spectroheliograph is not so much to separate the distributions of particular elements as to isolate different levels in the sun's atmosphere, and to provide separate photographs of what is occurring at each level.

The photographs obtained by this instrument are of great beauty, and reveal remarkable structure, which is entirely lost in the ordinary photographs which confuse all levels in a single blurred impression. The highest level is given by photographs taken in the red line of hydrogen Hα: these show feather-like clouds, whirling vortices, and long narrow black markings which are now known to belong to the red prominences seen projected on the sun's surface. These vortices are of special interest because of their connexion with sunspots; in fact, a sunspot occupies the trough of each whirlpool or whirlwind. If the whirling matter is electrically charged it should act like a solenoid and produce a magnetic field of force; and this consideration led G. E. Hale (1) to test whether a magnetic field could be detected in sunspots. When light is emitted or absorbed in a magnetic field each spectral line is broken up into two or more components—the well-known Zeeman effect; in particular, for light travelling along the lines of force, the spectral line is replaced by two components circularly polarized in opposite directions. Applying the test for these components in sunspots, no such effect was observed; the solar vortices was obtained. In general the field strength indicated in a sunspot is of the order 2,000 or 3,000 gausses. It is probably owing to the Zeeman effect that a large proportion of the lines observed in sunspots are observed to be slightly broadened.

An attempt to find a law governing the magnetic polarity of sunspots has not been very successful. On the earth, cyclones have a right-handed or left-handed rotation according to the hemisphere, but no such effect can be noticed on the sun. It seems that the predominant magnetic polarity in each hemisphere became reversed after the sunspot minimum of 1912. It is surprising to find that there is not even a uniform connexion between the polarity of the sun and the direction of rotation of the white dwarf at its polar axis.

One very general law is, however, recognized. It was pointed out by Carrington that sunspots very frequently occur in pairs, the lines of force being opposite. Since such pairs, now in these pairs the two spots are found to have opposite polarity. Even when the spot group is more complex a similar bipolarity is generally observed; Hale estimates that in 90% of the spot groups the bipolar area extends to a quarter of the disc.

The detailed explanation of these phenomena is difficult. If the magnetic field is due to the whirling of electrically charged gases, strong electric fields should be present; but the attempt to detect electric fields is blinded by the difficulty of detection. It seems to be a general belief that the origin of the whole disturbance is a vortex filament below the surface, whose two ends come to the sun's surface near the front and rear of the spot group and give rise to the opposite polarities there.

The method of detection of magnetic fields by the Zeeman effect, has been extended by Hale (2) to a determination of the general magnetic field of the sun (i.e., apart from the exceptionally disturbed regions indicated by sunspots) analogous to the terrestrial magnetic field. It is found that the magnetic axis of the sun deviates from the rotation axis, though not so widely as happens on the earth; the inclination of the two axes is approximately 11°. The periodic rotation of the magnetic axis is 31-34 days. If we could assume that the source of the sun's magnetic field is a permanent magnetization of its interior, we should give an additional strong indication of uniformity hitherto unknown. Hitherto our study of the sun's rotation has been based entirely on the surface markings, and these revolve at different rates according to their latitude; the period 31.5 days corresponds to that of surface markings in latitude 5°. It may, however, be doubted whether the source of the sun's permanent field lies very deep below the surface; it is found that it diminishes very rapidly as we ascend in level, decreasing from 50 to 10 gausses in about 400 km. The field appears to differ in other respects from that due to a uniformly magnetized sphere, being relatively too strong near the equator; but this is not quite certain.

The value of the constant c, which is now generally accepted is that determined by C. G. Abbot, viz. that outside the earth's atmosphere the amount of solar energy crossing each sq. cm. of surface is 1-93 gram-calories per minute. This is the same as we should expect if the sun's temperature in the black body at a temperature of 6,850° C. (absolute), which may accordingly be taken as the effective temperature of the photosphere. (The definition of effective temperature by different writers is unfortunately not uniform; and some would take as the temperature of the photosphere that at which the radiation is). The total radiation of the sun is 3-8, 10^17 ergs per second. The sun's radiant energy differs considerably in composition from the light received by the earth. In particular, the distribution in wave length of the energy, and the difference in intensity and composition of light received from the centre and the edge of the sun's disc. By comparing observations of the solar radiation made at the same time Butzenschiedt (Tubingen) and Bassign (Algeria) in 1911 and 1912, Abbot (3) believed he had obtained evidence of an irregular variability of the sun ranging over 10% in the course of a few months, since the same variations appeared simultaneously at the two widely separated stations, terrestrial causes
seemed to be excluded. But this supposed variability of the sun is disproved by Guthrie and Prager's (4) photoelectric measurements of the brilliancy of the planet Saturn. The planet, being illuminated by sunlight, would reflect an image of the sun's radiation; the delicate measures possible with photoelectric cells showed that the light is very steady, variations of the amount determined by Abbot being quite excluded.

**Solar System (see 25,357).**—A ninth satellite of Jupiter was discovered by S. B. Nicholson at the Lick Observatory in 1914. Like the eighth satellite it revolves round the planet in the opposite direction to the other seven. The periods of satellites VII and IX are about 732 and 745 days respectively, and the two bodies are revolving in almost equal orbitals in planes inclined at about 10°. Satellites VI. and VII. form a somewhat similar interlocked pair, their periods being 251 and 260 days respectively; but their motions are in the “direct” sense.

Much interest has been taken in the “Trojan Group” of minor planets. These illustrate a special case of the problem of three bodies discussed by Lagrange, viz. that in which the three bodies are situated at the vertices of an equilateral triangle. The Trojan planets have almost the same mean distance and revolution period as Jupiter, and the equilateral condition is roughly fulfilled. The problem of the small librations of such a planet about the triangular point of equilibrium has been discussed by E. W. Brown (5); the condition of stability is that the mass of Jupiter must be less than $0.9857$ times that of the sun—a condition which is easily satisfied—and the period of the libration is about 140 years. Actually the Trojan planets are at some considerable distance from the triangular points, and the problem of determining the finite librations (as opposed to impossibly small librations) has provided much exercise for mathematicians. Six members of the group are now known, Nos. 988 Achilles, 627 Patroclus, 624 Hector, 650 Nestor, 884 Priam, and 911 (unnamed); of these Patroclus and Priam are near the triangular point 60° behind Jupiter, and the others 60° ahead of Jupiter.

A very curious minor planet was discovered by W. Baade on Oct. 31, 1920, temporarily designated 1920 HZ. Its orbit is extremely elliptical (eccentricity 0.65); and its perihelion lies near the orbit of Mars, whilst its aphelion reaches near the orbit of Saturn. It is generally thought that a body with this eccentricity must necessarily be, or become, a comet, the extreme alteration of heat provoking the disruption characteristic of comets; but HZ shows no signs of a cometary envelope, and is provisionally classed as a planet.

The period of rotation of Uranus round its axis has been determined by V. M. Slipher from measures of the line of sight velocity of the advancing and receding limbs. The result is $10^\circ$ 50′ and the direction of rotation agrees with that of revolution of the satellites. Leon Campbell subsequently found that the light of the planet is variable with the same period, presumably owing to unequal brightness of different parts of the surface. The rotation period of Venus still remains a mystery; and there are advocates of the long period of 242 days as well as various estimates of short period (one to three years).

**Latitude Variation (see 16,267).—**The study of the small periodic motion of the earth's axis of rotation (relatively to the earth) which gives rise to “variation of latitude” has been continued at the six international stations (reduced in number during the later stages of the World War). The effect is made up of (a) the free precession of a spheroid rotating about an axis which does not coincide with its axis of figure; the period of this precession determined from the observations is 434.2 days; (b) the annual term, which is a forced oscillation due to meteorological and seasonal causes. Owing to interference of these two terms, there is an effect analogous to “beats” in sound waves, the amplitude of the motion alternately rising to a maximum of about $0^\circ$3 (30 ft.) and dying out in about six years' period. The annual term appears to be nearly circular (6) and of amplitude $0^\circ$085; the possible causes contributory to this, such as seasonal circulation of the atmosphere and ocean, snowfall, and vegetation have been investigated by H. Jeffreys (7), who finds a fair agreement between predicted and observed values. A mysterious Kimura or Z term, which appears in these international results, would, if interpreted literally, indicate an annual approach to the pole and recession by all stations on the same latitude simultaneously—or a shifting of the earth's centre of gravity to and fro along its axis. It is, however, now believed that the term arises from a small systematic error in the observations; independent observations made at Greenwich and Pulkovo (not belonging to the international chain) show either a reduced or zero Kimura term.

**The Stars (see 25,786).—**In our knowledge of the stellar universe must depend largely on the patient accumulation of accurate statistics as to the parallaxes, motions, spectra, magnitudes, etc., of large numbers of stars; it may therefore be well to review the great advance in these data in recent years. The first photographic determinations of stellar parallaxes reaching a modern standard of accuracy were made by H. N. Russell and A. R. Hinks at Cambridge, and F. Schlesinger at Yorkes, in 1903-7; earlier results are now superseded except for a few of the best heliometer measures made chiefly by Gill. Extensive programmes have since been carried out with large telescopes at the Allegheny, Greenwich, Leander McCormick, Mount Wilson and Sproul observatories, and by 1921 parallaxes of about 1,600 stars had been measured with probable errors generally not greater than $0\text{''}01$. The use of a rotating sector to reduce the brightness of the star under observation to that of the comparison stars has made a considerable improvement in the accuracy. Unfortunately it does not follow that we know the parallaxes of 1,600 stars, for many of these parallaxes turn out to be inappreciable. The results emphasize the fact that very few of the stars are sufficiently near for the method to give any close measure of the distance; and a large proportion of the measures are of little use individually though they may throw light on questions of statistical distribution when taken in conjunction with other evidence. We cannot resist the impression that investigation of stellar parallaxes by the trigonometrical method is reaching its limit with present instruments; and perhaps for that reason special interest is attached to a new method of determining the distances of stars described below under “Spectroscopic Parallaxes.”

**Lewis Boss's Preliminary General Catalogue of 6,183 Stars published in 1910 has been an invaluable aid to research with regard to proper motions. It comprises all the brighter stars, and the proper motions constitute a great improvement both as regards both accidental and systematic error on anything previously available. Of other catalogues the most notable is the Greenwich 1910 catalogue containing the proper motions of 12,658 stars in the zone Decl. +24° to 32°; the accuracy, of course, does not equal that of Boss's catalogue, but it carries our knowledge of the motions of stars in this region as far as the ninth magnitude. We have still very little systematic knowledge of the motions of still fainter stars, which can be measured photographically; attention has chiefly been directed to the detection of exceptionally large motions by the "blinking" microscope or by other methods.**

The first really extensive lists of radial velocities were published by the Lick Observatory in 1911. At present (1921) about 2,070 have been determined; these have been collected in a catalogue by J. Voûte. Progress would have been more rapid but for the large proportion of spectroscopic binaries, which makes it necessary to repeat the measures several times at suitable intervals in order to discriminate between orbital motion and the true secular motion which is looked for. Orbits of 177 spectroscopic binaries are known; and in addition there are about 640 spectroscopic binaries with orbits as yet undetermined. It appears therefore that approximately one-quarter of the stars examined have proved to be spectroscopic binaries. Allowing for systems of wider separation (not detected by varying radial velocity) the actual proportion of binaries must be still higher.

The apparent magnitudes of stars range from $-8.5$ for Sirius, to $20^\circ$ and upwards for stars obtained by long exposures with the
largest instruments. The corresponding light ratio is more than 100,000,000 to 1; and it is an important and not very easy problem to subdivide this range accurately. For this purpose a set of 96 standard stars have been chosen near the North Pole, called the Harvard blues; their magnitudes were determined by visual comparisons from the first to the twenty-first, and when once these have been accurately fixed on the absolute scale, it is comparatively easy to determine the magnitudes of any other stars by differential comparison. An alternative and more systematic method, which affords a very clear view of the sequence adopted at Harvard and Mount Wilson respectively for part of the range, which is still being inquired into; but good progress has been made in this direction, and separate standards are used for magnitude determinations. Separate standards are used for visual and photographic magnitudes; their relation has been fixed by international convention so that visual and photographic magnitude of the same star are numerically but 0.5 different.

Photographic magnitudes have been determined at numerous observatories, one of the most valuable being K. Schwarzschild's Göttingen Astronomie, the brighter stars being observed by him. New Struve, in 1883, had available a class of faint stars which were observed at the Bureau (the late E. C. Pickering alone made a million and a half photometric measures) and to Potsdam observatories. It is now becoming usual to determine "photographic" as equivalent to visual magnitudes, i.e. to use a photographic plate of colour-sensitivity corresponding to that of the eye.

Since the photographic plate is most sensitive to blue light and the eye to yellow light, half of the photographic minus visual magnitude gives a quantitative measure of the colour of the star. This is called the "colour-index." As might be expected, it is very approximately a function of the spectral type, so that the spectral type may be determined from the photographic minus visual magnitude, affords a very useful method of classifying stars too faint to permit of spectroscopic examination. The colour-index ranges from about 0.4 to -1.4 for spectral class O, -5 for spectral class B stars (type M). The Draper notation has almost displaced Secchi's other early nomenclatures of spectral types. The principal stages from the hottest to the coolest are denoted by the letters B, A, F, G, K, M, each stage in sequence increasing by 0.5 magnitude, except that type O preceding and hotter than type B; and type N (Secchi's type IV) appears to form an alternative branch succeeding K and parallel with M, the bifurcation perhaps depending on whether the star is yellow or red. The first members of this sequence are recognized by type R, probably intermediate between K and N, and has been added. In types M and N the temperature is low enough for the spectra of chemical compounds to appear prominently; type M is characterized especially by titanium oxide, and type N by compounds of carbon. A catalogue of the spectral types of 230,000 stars classified by Miss J. A. Cannon is in course of publication by the Harvard Observatory.

Giant and Dwarf Stars.—It will be realized that this great gain in quantity and quality of the material available for discussion has permitted of considerable advance in our knowledge of the structure of the stellar universe, since 1910. The most-far-reaching of the recent discoveries is the detection of the two classes of "giant" and "dwarf" stars.

To understand this distinction we must go back to Homer Lane's theory of the evolution of gaseous masses (see 25,786). Starting with a very diffuse globe of gas held together by its own gravitational attraction, the conditions of equilibrium require that its temperature must rise when it contracts through radiation of heat. This rise of temperature continues so long as the material is rarefied, following the laws of a gas; but as the density approaches that of a liquid the changed conditions limit the rise, and ultimately the temperature begins to fall again; the fall continues until the star ceases to shine. It follows that the true chemical condition of a giant star is such that its temperature is passed through twice, once ascending in a comparatively early stage of evolution, and once descending in a later stage. Now the Draper and other standard classifications of stellar spectra are practically the same, but in the second sequence the conditions are entirely different: the temperature is the primary condition which determines the appearance of the lines and bands distinguishing the spectral types. So in any type of spectrum we have two groups of stars which have the same temperature but are wide apart in all other respects; more particularly they differ in luminosity and stage of evolution. For example, the present effective temperature of the sun is 6,000° C; it has a density greater than that of any other star; and is in the main sequence stage; but at an earlier epoch it must have passed through the same temperature ascending. It was then a diffuse globe of about 10 times its present diameter and 100 times its present surface; the temperature was then 100 times as much light as now. These two stages are called the dwarf and giant respectively, and the most conspicuous outward characteristic is the great difference of luminosity, due to the larger surface area in the giant stage.

Instead of having a single sequence of evolution B, A, F, G, K, M we see that a star must start as a giant of type M, ascend the sequence towards type B, and then descend as a dwarf to type M again. It depends on the mass how far up the series it gets, and probably a dwarf of 8 times the sun's mass will be the most that it will reach the high temperature of type B. Smaller stars will turn at A, or even lower. As Russell has put it, a star of small mass is a poor self-heating affair. The division of giants and dwarfs is most clearly brought out in the H-R diagram. All stars in the corresponding stages are then furthest apart in the evolutionary sequence; for types A and F the two groups begin to merge into one another, and their separation is thus the result of the mass.

These conclusions were put forward independently and simultaneously by H. N. Russell (8) and E. Hertzsprung. The observational evidence drawn from many sources is now overwhelmingly favorably disposed to their views. The discovery of the giant stars has been the result of the photographic method. The discovery of the dwarf stars has been the result of the spectroscopic method. The two are complementary, but if these masses are arranged according to spectral types the bifurcation of the luminosities is evident. The luminosities of the giant stars depend very little on the spectral type of the star; and the luminosities depend on the masses. The giants have a luminosity corresponding to the mass of the sun, and their absolute magnitudes cluster very closely about the value +1.0. For the dwarfs the decreasing temperature and decreasing surface cause a rapid fall of brightness through the successive types, and the absolute magnitude falls to about +10.0 for type M. By the new spectroscopic method of determining stellar distances, Adams and Joy (9) have been able to give striking evidence of the correctness of the spectral classification of the sun as a giant star.

Finally all doubt as to the existence of these giant stars is set at rest by Pease and Anderson's direct measurement of the angular diameter of Betelgeuse made with a 20-in. interferometer at Mount Wilson. The angular diameter of the sun is calculated as 0.00425 and of Betelgeuse as 0.005. Unfortunately the parallax is too small to be measured with much certainty; but it may be taken as proved that it is less than 0.05. This makes the linear diameter of Betelgeuse not less than 140 million km, or 100 times the sun's diameter. This is an example of a type M giant at the very end of the evolutionary sequence.

Spectroscopic Parallaxes.—Although giant and dwarf stars of the same spectral type may be very different in luminosity, a detailed examination of particular lines reveals distinctive differences. It was early shown by E. Hertzsprung that these spectral marks were variable (12) and that they belonged exclusively to stars of a particular type or series. Miss Maury (13) and Miss A. Kohlschütter (14) have shown that the spectral marks are variable only when the spectral type is greater than type K. The most conspicuous difference between giant and dwarf stars is that the luminosities of giant stars are so much greater than the luminosities of other stars. Parallaxes determined by this method for 1,660 stars have already been announced (9).

The stars which are the deep red stars have been discovered which are of special interest owing to their closeness to us. In 1916 E. E. Barnard detected a star of visual magnitude 9.7 in com
299

Astronomy

RA:17°33', Dec. 4°27' N, having an annual proper motion of 19.5., its distance is 195 light-years. It is the second
nearest star (a Centauri being the nearest). A faint com-
ppanion to a Centauri (sharing the same large proper move-
discovered in the same year by K. T. A. Innes; its visual magnitude is
3, and its peculiarities are the same as that of a Centauri. It appears that this companion is distance
astronomical units from the principal components, and its
period of revolution round them is given as about 80,000 years. It is also hard to say whether it is proper
or not, so that it is actually the nearest star known; for
reason it has been named Proxima Centauri. Barnard's and Innes's stars, being both faint and close to us, must
be of the same nature. This view is supported by Harries's
of other companions to stars of large parallax, forming the four
intrinsically faintest stars yet known:—

Barnard star absolute visual magnitude +2.9
Proxima Centauri absolute visual magnitude +13.3
Groombridge 34, com absolute visual magnitude +3
Pl. 2123, com absolute visual magnitude +12.3

As might be expected all four are red stars in the last stage before extinction, so that photographically their magnitudes are even fainter. Proxima gives less than 1/10,000 of the light of the sun. A distant companion to Capella discovered by Furlanhelm must also be very faint; but it is probably brighter than those above men-
tioned. At the other end of the scale it is certain what is the maximum luminosity reached by the stars, because of the smallness of the parallax the average is 0.2, which makes it
Rigel, and other stars may approach or even surpass
10,000 times the sun's luminosity, but it is not possible to obtain a ratio large enough to decide whether the fainter stars are
absolute stellar magnitude is thus from -5.0 to -15.0, or a
hundred-million-fold ratio of luminosity, with the sun just
at the middle. This range is much the same as the known range of apparent brightness of the stars of the same distance from the earth, so that apparent brightness is practically no guide to the distance.
Stars of low luminosity are far more common in space than those of high luminosity. Thus we find the four red dwarfs above men-
tioned within very small distance from the sun, and doubtless they are equally plentiful throughout the stellar system; but we have to extend our net to very great distances to catch Canopus and Rigel representative of the brilliancy of the faint component of the fixed stars, as very exceptional freaks of nature. Perhaps it is unfortunate
for the most exceptional stars catch our attention by their brilliancy, and figure to a disproportionate extent in our catalogues.

Matter of the extent of the world at a given time is striking contrast to the enormous range of intrinsic brightness, is the comparative uniformity of the masses of stars. Some knowledge of their masses may be gained from a study of the orbits of visual binaries of known parallax, and also from spectroscopic binaries (in which case the parallax is not needed). In general the range of mass is surprisingly small, the result being usually between one-half and twice the sun's mass. Exceptions prob-
able other stars more than they really are, because there is now
tendency to pick out the very luminous stars, which are believed to have masses above the average. Stars of type B are found to be on the average three or four times as massive as the others, confirming the old idea that they are born at the highest temperatures. Both components of V. Puppis (type Bi) have masses not less than 17 X sun; these are the greatest yet meas-
ured, though we suspect that masses up to, say, 50 X sun may oc-
casionally be found. Mass of the faint component of the double star Krueger 60 which is between 1/6 and 1/8

Attention to these extreme cases scarcely does justice to the
uniformity of the great majority of the stars; from a theoretical
relation between luminosity and mass for giant stars it is probable
that 90% will have masses between 1 and 2 X sun.

Advantage is taken of this uniformity to determine the so-called
"hypothetical parallaxes," or dynamical parallaxes, of double stars. If
1 is the semi-axis of the orbit in astronomical units, P the period
in years, and m1+m2 the mass of the system in the sun, we have

Thus a can be found if m1+m2 is known or guessed. We may
assume with fair probability that m1+m2 = 2, the possible deviations being comparatively unimportant because the cube-root is taken in doing the calculations. The apparent orbit in the sky; comparing the angular measure with the linear measure given by the above calculation, we at once find the distance or parallax of the star. It is possible to modify the procedure to fit stars whose parallaxes are not small arc
seconds. Dynamical parallaxes of 556 double stars have been published by J. Jackson and H. H. Furner (12); from these the absolute magnitude of the stars can be found, and the apparent parallax and linear parallax velocities (transverse to the line
sight) were calculated. The magnitudes showed clearly the bifurca-
tion into giants and dwarfs. The linear velocities were combined to give a determination of the sun's motion through the stellar system, the magnitude of 19-1/2, R.A.-27°, Dec.-4°. This agrees remarkably well with the values

1That is, 17 times the sun's mass.
we can calculate that a globe of gas having the mass and density of a Cepheid will vibrate in a period between 4 and 10 days (varying between these limits according to the adiabatic constant of the material of which it is composed); the observed period is 5.37 days. The most serious objection urged against the pulsation theory of Cepheids was the disparity between the spectral type of the star and the spectral type of the nebula. But it appears that at minimum and maximum, because all parts of the disc would not be moving with the same speed in the line of sight; this has not been discovered, but it is hoped that astro-physicists of the future will be able to effect will be thoroughly sought for in the near future. It may be remarked that some variation of light will arise directly from the dilatation and contraction of the surface; but this is not the leading variation. The gross maximum and minimum occur when the star is passing through its mean volume. The indirect effect of the compression, changing the rate of flow of radiation, is much more important; and although the detailed mathematical discussion of the matter has not yet proved tractable, there is a general agreement of theory and observation.

The name "Cepheid" was at first restricted to stars with periods usually between three and eight days; but longer and shorter periods have been found, and it is now recognized that the "cluster variables" with periods less than a day are of the same nature. These occur abundantly in several of the globular clusters. In examining a globular cluster we have the great advantage that all the stars under review are at practically the same distance from us, so that apparent differences of brightness are real differences of brightness, and are not confused by effects of distance. Now it is found that in a globular cluster Cepheids of the same period have all the same brightness; so that a Cepheid of definite period is a standard object, whose absolute brightness will presumably be the same under similar circumstances. This has already been uniformly noticed by Miss Levitt for the variables in the Lesser Magellanic Cloud; the results have since been extended by Shapley who has calculated the curve connecting luminosity with period.

Now that we know a Cepheid among the brighter and probably among the more massive stars, ranging in absolute magnitude from $-15$ for periods of three days to $-9$ for 18 days, and so on. Most arc of spectral type F to G, becoming redder as the period lengthens; those with periods under a day are of type A. The range of the variation in magnitude is generally between $0^m.5$ and $9^m.0$, but doubtless many with smaller variations escape notice. The Pole Star is a Cepheid with a light range of only $0^m.2$ and a period of 397 days.

Note.—Two "new stars" of unusual brilliancy have appeared in the sky during the past year. One, discovered independently by a great many observers on June 8, 1898, was not discovered by Max Wolf three days before discovery showed that it was still normal. Incidentally we may note that it cannot have been a red star (types K or M) or it would have appeared in visual catalogues. On June 7 it had reached $6^m$ according to a Harvard photograph. The next day (when it was discovered) it had brightened to $5^m.5$; and on June 9 it was only slightly inferior to the Pole Star. The redness probably depends on some occasional fluctuations; and it had faded to $5^m.5$ by the end of October. W. F. Denning discovered a Nova in Cygnus on August 20, 1920, which reached the second magnitude. Its earlier history is unknown, but it must have been fainter than $15^m$ in 1908.

Broadly speaking each Nova reproduces the same sequence of phenomena with remarkable fidelity (15). At the brightest the spectrum is that of a star of type A. A few days later absorption lines appear by the side of corresponding absorption lines which are strongly displaced to the violet. The absorption lines become doubled and tripled, as though there were several layers of superposing gases having different speeds in the line of sight. The line of sight becomes a visible disc in large telescopes. The observed rate of spreading seems to agree with the speeds indicated by the spectroscopy. Many theories have been suggested to account for the outbreak. A shower of powerful rays seems to be the most simple and most probable; and, moreover, the regular sequence of changes could scarcely be started by a haphazard impact. An eruption from within, whether occurring spontaneously at a certain stage of evolution or precipitated by the entry of a giant star into a very small nebula, is more likely; but this theory also presents difficulties. J. H. Moore has recently obtained evidence that the extended nebulous disc, which is ultimately formed, shows differential motions of rotation in different parts. In any case it seems likely from the very rapid sequence of changes that the main outbreak is only skin-deep. Novae always occur within the limits of the Milky Way (or galactic nebulae); but this may perhaps be due to the greater depth of the stellar universe in this direction. So far as can be judged the Nova before the outbreak is a dwarf star; and at least in the case of Nova Aquilae of 1926 there must have been a very red star. (The long-period variables, whose violent outbreaks are rather suggestive of the explosion of a Nova, are giant red stars.) We may meditate on the fact that the historical evolution of the galaxy may be at the same stage of evolution as that through which the sun is now passing.

Stellar Velocities.—In 1910 J. C. Kapteyn and W. W. Campbell announced independently that (after allowing for the solar motion) the average speeds of the stars increase continuously as we pass through the spectral series from type B to type M. Kapteyn deduced the result from the proper motions, and Campbell from the spectroscopic radial velocities. At that time the older view, that the progression from B to M was the order of evolution, held the field; and it seemed as though the motion of a star must increase as it grows older. But the giant and dwarf theory shows that it is not a question of stage of evolution.

Take for example Campbell's figures: the average radial speeds are—type B, 6.5; A, 10.9; F, 14.4; G, 15.0; K, 16.8; M, 17.1 km. per second. In this investigation the K and M stars were almost all giants, so that so far as this analysis goes the youngest stars have the highest speeds, but Eddington found that the dwarf K and M stars at the other extreme in the sequence of evolution have still higher speeds. Of the 19 nearest stars, the nine brightest have a mean transverse speed of 29 km. per sec. (corresponding to a mean radial speed of 18.5 km. per sec.); whereas the 10 faintest stars, having with luminosities less than $10^{10}$ sun, have a mean transverse speed of 68 km. per sec. (radial speed 43 km. per sec.). W. S. Adams confirmed this by determination of the radial velocities of 16 stars whose luminosity is less than $10^{10}$ sun, the mean radial velocity is 36 km. per sec. or more than twice that of the giant stars of the same type. Similar results were arrived at independently by investigation by Eddington and Hartley. Finally Kapteyn and Adams (16) announced a general progressive dependence of velocity on absolute brightness, the faintest stars having the greatest average speed.

Theories of stellar evolution differ widely regarding the ratio between mass and with luminosity. It seems likely that the primary association is between speed and mass, the dependence on luminosity and spectral type being due to the correlation of these with mass; as already mentioned, only the most massive stars can reach the hottest spectral types. If this view is correct we must regard the quick-moving dwarf stars of types K and M as having particularly low masses—either because the smallest stars run their course of evolution more quickly, or because mass has been lost along with the energy radiated during their past history. The last suggestion may seem extravagant, but it must be pointed out that all energy has been radiated, and so that it is possibly possible. The only question is whether the life of the star is long enough for this loss of mass to amount to anything appreciable; and as to the length of life the most widely divergent views have been put forward. The calculation of the duration of life depends on speed and mass, J. Halm (17) has advocated the tempting hypothesis that it is an example of the equipartition of energy—brought about by the laws of statistical dynamics exactly analogous to the equipartition of the mechanical energies.
It is significant that the line of preferential motion lies exactly in the galactic plane. The phenomenon may be due to two great systems of stars passing through one another; or it may represent some dynamical conflict of the stars. The latter view has often been favoured, mainly owing to the very elegant mathematical specification of the corresponding velocity distribution given by K. Schwarzschild's ellipsoidal theory (19).

H. H. Turner (20) suggests that if the stars were originally formed as an extended system with little or no initial motion, the system would settle down to a steady state in which the motions were predicated of the galaxy. It is not easy to detect the relative centricity, the stars in its neighbourhood would be moving preferentially in the line towards and away from the centre. An analogy is afforded by the comets in the solar system, which, observed from an outer planet, would appear to move predictably towards and away from the sun. This explanation seems satisfactory on the whole. It may be objected that, according to statistics of distribution, the preferential motion of the stars appears to be, not in the direction of the vertex, but 90° away; and the view preferred by Strömberg and by Jeans is that the star-streaming is due to predominant transverse (circular) motion rather than radial motion. It is difficult to see how such a state of motion could originate. H. Shapley has, however, shown that the "local system" (considered in studies of stellar distribution) is but a small part of a much greater galaxy: we stand on the outskirts of the latter, and R.A. $262^h$ Declinaion $23^o$ has a distance of about 30,000 light years; this is further against the steady configuration.

Moving Clusters.—Many years ago R. A. Proctor pointed out a group of stars in the neighbourhood of the Hyades with practically equal proper motions; the researches of L. Boss (21) have thrown new light on the nature of this association. He recognized as belonging to the group 39 stars spread over an area $15^o$ square; the motions appear to converge towards a certain point in the sky—a perspective effect which would naturally occur if the actual motions in three dimensions are parallel; the direction of the convergent point gives the direction of the common motion of the group as a whole.

Knowing the spectroscopic radial velocity of one or more members, we can by an easy geometrical construction find the whole linear velocity and also locate each star separately in space. We thus obtain exceptionally full and exact information as to the distribution of luminosities of this group of stars. The cluster is roughly spherical with a diameter of 10 parsecs; there must be many non-associated stars—accidental interlopers in so large a region—and perhaps the most significant conclusion is that the casual attractions of the stars are not able to disturb appreciably the parallelism of the motions and so scatter the cluster. Another remarkable "moving cluster" is formed of five stars of the Plough together with stars widely separated in the sky, including Sirius, a Corona Borealis, and $\beta$ Eridani. Similar associations, especially frequent among stars of the B type of spectrum, one of the most distinct being a chain of stars crossing the constellation Perseus.

Number and Distribution of Stars.—Important statistics of the number of stars down to various limits of magnitude have been obtained by Chapman and Melotte and by P. J. van Rhijn. We give some results of the latter investigation which is the more recent (22).

The total number of stars down to photographic magnitude 16.0 is 15,000; by the method of accidental selection it is estimated that the total number of stars in the system is between three and four thousand millions, and to reach half this number it would be necessary to go as far as magnitude 28.5. (Exactly what is meant by the "system" is somewhat difficult to define; there may, of course, be exterior galaxies or extensions which are not reckoned in these counts.) An important point is the well-known fact that the overwhelming majority of the stars are distributed in the galactic plane; the fraction of the stars in the outer sheets is much less. The stars are distributed in the galactic plane 51 times as thickly as at the galactic poles. This is an increase compared with the concentration of the brighter stars; up to magnitude 8, the corresponding ratio is 15. We can easily understand this greater concentration of the faint stars, since on the average they carry us to greater distances, at which the oblate shape of the stellar system has pronounced effects.

Taking a lower limit of luminosity 1/2000 X sun, it is estimated that there are 30 stars within a sphere of five parsecs radius round the sun; about 20 of these have actually been identified. If this fainter limit is accepted, there would be over nine million faint stars; besides an unknown but probably large number of extinct stars and of stars giving less than 1/200th of the light of the sun. This gives an idea of the possible extent of the star cloud to which we belong; there can be little doubt but it must fall off very considerably at distances not greater than 1,500 parsecs, more especially in the directions of the galactic poles.

An analysis based on an investigation by Kapteyn, van Rhijn and Weersma (23) shows the average parallax of stars of different magnitudes:

It is an even chance that a particular star has a parallax between 0.23 and 1.13 times the average parallax for its magnitude.

Globular Clusters.—About 70 globular clusters are known, distinguishable from the loose irregular star clusters by their symmetrical and condensed appearance. These have been the subject of a remarkable series of researches by H. Shapley (24).

It has already been mentioned that some of them contain many Cepheid variables, which, from their luminosities are known from their periods. Thus in Messier 3 (Canes Venatici) the period of one of 110 Cepheid variables is 15.5, the individual stars deviating as a rule no more than $+0.1$ from this mean. In the cluster M 13 (Vulcan), 50 Cepheid variables are observed, the mean period $27.7$; in the cluster M 15 (Pegasus) there are 50 stars, the mean magnitude $13.5$. It is clear that the difference $13.9$ must correspond to the greater distance of Messier 3; and we easily deduce that the ratio of the distances is 2.43, this ratio being very accurately determined. We are not quite so certain of the absolute distances of the two clusters; but the evidence seems to indicate that the absolute magnitude of these variables (with periods less than a day, $80$-2), which gives the following distances, M 3, 5,000 parsecs; Messier 3, 14,000 parsecs. When it is recalled that the usual trigonometrical method can scarcely be applied to determining distances greater than 20 parsecs, the extraordinary power of this method of plumbing space will be realized. The method was first used by E. Hertzsprung to determine the distance of the Lesser Magellanic Cloud.

By this method and by supplementary devices, Shapley has been able to show that the distribution of the globular clusters in space forms an idea of the extent of the system which they outline. Even in this vast system the galactic plane is still a plane of symmetry and symmetry is shown throughout, the stars being arranged parallel to the plane, and below, the average distance from the plane being eight kiloparsecs. In plan the system is elongated with its axis in a galactic longitude $325^0$—nearly the direction of star streaming; the greatest diameters are at least 60,000 parsecs. The system is not spherical, but inclined so that practically all the globular clusters are found in one hemisphere of the sky. The most remote cluster known is distant 67 kiloparsecs or 200,000 light years. We have to recognize that the "stellar system" dealt with in the researches described previously is but a small star cloud in this greater galactic system. Roughly speaking those researches may be considered to relate to a domain of about 800 parsecs radius; the sun seems to be fairly centrally placed in the local star cloud (about 90 parsecs from the centre, according to Charlier), but this is on the outskirts of a greater system whose centre is 20,000 parsecs away.

In his recent essay on the stars, Shapley neglects any possible loss of apparent brightness owing to absorption of light in space. Anything of the nature of a fog or scattering medium would cause the greater loss of light in the blue than in the red, and would consequently carry rays into an oblique region of the sky. The reverse is the case for the more distant stars. Such a reddening has been sought for by King, Kapteyn, H. S. Jones, and others, and provisional estimates of the extinction have been made. Shapley considers that the extinction must be altogether negligible, resting his case on the observation that the colour-indices of stars in clusters range from $-0.5$ to $+1.5$ just as those of the nearer stars do. It seems therefore impossible that their light have been so greatly affected as to delude our attempts to determine the great extinction. The general absorption in space must be so low that a ray of light proceeding through interstellar space can travel for 50,000 parsecs without the amount of absorption sufficient to delude 1% of its intensity. Nevertheless there are large tracts of obscuring material in particular regions, which hide more or less completely the stars behind. These are found especially in the Milky Way, and consist of dark or faintly-luminous nebulae often of great extent; perhaps there is no hard and fast division between them and the...
irregular gaseous nebulae like the Orion nebula. A large obscuring tract is suggested by the nebula, and it is not at all clear how far it reaches, since it may be compared with Kapteyn's value 190 parsecs for the Orion nebula. A catalogue of 182 dark markings in the sky has been given by E. E. Barnard (25).

**Nebulæ.**—Whereas the irregular gaseous nebulae are comparatively near, and within the local star cloud, the spiral nebulae are very remote—perhaps more remote than the globular clusters. According to one theory, they are "island universes" coeval with the great galactic system. Others would consider them rather as outlying dependencies. Unfortunately we have no trustworthy knowledge of their distances; estimates have been made from the apparent magnitudes of the novae which have appeared in them, but these seem to be very speculative. The spirals have been found to possess extraordinarily great velocities in the line of sight and in general the motion is directed away from the sun. This seems to argue a lack of dynamical association with the galactic system. The mean speed of 300/31 spirals measured by Slipher, is about 200 km. per sec. Independent determinations by Slipher, Wright, and Pease agree well on a velocity of 300 km. per sec. for the Andromeda nebula; for some nebulae speeds exceeding 1,000 km. per sec. have been found. The Theory of Relativity suggests an interesting explanation of these high speeds, and more particularly the preponderance of receding velocities. De Sitter's form of the theory of curved space-time actually predicts an effect of this kind for very remote objects (20).

The planetary nebulae are presumably much less distant. They have not been observed directly except near the sun, but the inference from their spectra to any intermediate distance seems to be not the same as that referred to the stars. They do not show preferential motion along any axis. The average radial velocity is 30 km. per sec.—about the same as that of the eastern stars (the so-called N. E.). When the planetary nebulae are photographed with an objective prism of large dispersion, it is found that the various monochromatic images are of different forms and sizes; so that important information is obtained as to the distribution of the emitting gases through the nebula. Perhaps the most fundamental problem presented by these objects is whether all parts of the disc are independently self-luminous, or whether the light-emission is stimulated by radiation coming from a central star or nucleus.

**II. THEORETICAL ASTRONOMY**

Gravitation.—The epoch-making theory of gravitation, put forward by Einstein in 1915, is described in the article RELATIVITY. We refer to it here because the new law of gravitation, required by his theory, removes the most outstanding divergence between theory and observation in the solar system—viz. the progression of the perihelion of Mercury. There is still some discrepancy between theory and observation for the motion of the node of Venus; but this is a much smaller residual, and may perhaps be attributed to accidental errors. Einstein's predicted effects are the bending of light and the radial gravitation, verified by the British eclipse expeditions in 1919. His third crucial test—a general displacement of spectral lines to the red in the sun as compared with terrestrial sources—was still in 1921 a subject of controversy.

E. W. Brown's lunar theory, developed according to the methods of G. W. Hill, was completed by the publication in 1920 of full Tables of the Moon's Motion. It seems safe to say that no term of appreciable significance has been omitted; nevertheless the moon deviates unmistakably from its theoretical place in an irregular manner. An investigation by H. Glauert (27) seems to show that the irregularities are at least partly due to variations in the rate of our standard timekeeper, viz. the earth's rotation; for the longitudes of the sun, Mercury and Venus exhibit similar irregularities, and the curves closely resemble one another. Besides these irregular changes, there is a general secular acceleration of the moon, which, being cumulative, leads to large changes in the circumstances of ancient eclipses. The historical evidence of all kinds has been reviewed by J. K. Potherington (28) who arrives finally at the values 10^{-5} for the moon's secular acceleration and 10^{-6} for the sun's secular acceleration. These quantities are presumably attributable to tidal friction which causes a direct acceleration of the moon's orbital motion, as well as a spurious acceleration through the increase in the length of the standard of time.

It is now believed that the bodily tides in the earth have little effect and that the most effective retardation is due to tides in the sun, and at least to G. I. Taylor the Irish Sea alone contributes \( \alpha \) of the total dissipation of energy.

**Evolution of Rotating Masses.**—The figures of equilibrium and the final disruption of rotating fluid masses have been studied in great detail by J. H. Jeans. In agreement with Liapounoff he has found that the so-called "pear-shaped" figure of equilibrium, which such ellipsoids of revolution have, is a Jacobi ellipsoid, being a constant of his conclusions as to the evolution of double stars, spiral nebulae and clusters of stars. Reference must be made to his book *Problems of Cosmogony and Stellar Dynamics*. With regard to the solar system, he finds it impossible to accept the hypothesis of the stability of the planets by rotation alone; and he attributes them to a tidal disruption of the sun having occurred at some distant epoch in the past. If this view is correct the system of the planets is a "freak of nature," owing its existence to a chance encounter of some larger star (which approached within less than the sun's diameter from its surface). Few, if any, other systems of this kind can have been formed; and the common view that all stars are spherical may be true.

Mathematical investigations of the possible steady states of a system of stars moving under gravitational forces have been made by C. H. Henry (29). It seems certain that the only possible states are those in which the stars are distributed in a definite law, which is the adiabatic law of density of a gravitating sphere of gas for which \( \gamma \) has the critical value 1.2. Although this appears to have important dynamical significance, no very satisfactory explanation can be given.

**Radiative Equilibrium of the Stars.**—The discovery that many of the stars—the giant stars—are diffuse globes of very low density, gives a stimulus to investigations of their internal conditions of equilibrium; for the material, being practically a perfect gas, will obey comparatively simple laws. In the earlier researches of Lane and Ritter it was supposed that the equilibrium was adiabatic—that is to say, the material was continually stirred by convective currents, hot gases ascending to replace the continually cooling material at the surface. But it is now clear that the heat passes to the surface through the material transversely (in a direction perpendicular to the equipotential surfaces). The equilibrium is that each element will settle down to the temperature at which it radiates an amount of heat equal to that which it absorbs from the radiant heat flowing through it. This first point was found by R. A. Sampson, and the theory of radiation equilibrium was developed by K. Schwarzschild for the external layers of the sun, Eddington (31) has based on this principle a theory of the adiabatic equilibrium throughout the interior of a star.

At first the principal unknown constant was the molecular weight of the material of the star. It was, however, pointed out by Newall and Jeans that the atoms were probably strongly ionized at the high temperatures prevailing; and this led to a simple solution of the problem. The number of atoms per cubic centimetre in an atom at a given temperature is 

\[
M = \frac{4 \pi n^2 G}{k}
\]

where \( M \) is the mass, \( G \) the constant of gravitation, \( n \) the number of atoms per cubic centimetre, and \( k \) the constant of the temperature. If the temperature is high enough for the atoms to be ionized, the mass of the star is much smaller than the mass of the electron, and the mass of the electron is of the order of magnitude of the mass of the proton.
the formula for the rate of radiation; and hence (provided \( k \) remains constant) the rate of production of energy remains the same through all stages of evolution until it becomes too dense to behave as a perfect gas. This agrees with the observed fact that the average magnitudes of the giant stars are approximately the same for all spectral types. If the rate of radiation and the absolute luminosity is a function of the mass, and it becomes possible to calculate the rate of radiation of giants of different masses. This leads to the total rate of radiation of stars of different types F and G are comprised within absolute magnitudes \( 3^0 - 0.5 \); these correspond to masses 0.07 to 1.6 times that of the sun—the average of the known typical stellar groups of 150 to 200 stars. This is why we may conclude from a knowledge of the rate of radiation of giant stars of known mass; it is approximately 20 C.G.S. units, that is to say, radiation after passing a column of stellar material of 1/20 gram per sq. cm. would be reduced to one-third \(( \frac{1}{3} \) \( r \)) of its original intensity. This is a very high opacity, but it is of the same order as that found in laboratory experiments on X rays, to which the high temperature radiations within the stars are closely akin. It is remarkable that the opacity is very little from one star to another in spite of their considerable differences of temperature.

Taking account of the deviations from the laws of a perfect gas, the theory can be extended (though with less certainty) to other stars. The most interesting point is to determine the maximum temperature attained by stars of different masses. Measuring the mass of the sun, a mass \( \frac{1}{2} \) should just attain effective temperature 30000° K. Above this temperature it would rapidly appear that a mass \( \frac{1}{2} \) attains 6000° (type G); mass 1 attains 9000° (type A—F); and mass 2-5 attains 14000° (type B). These results will be no more reliable than the radiation of the stars is available for checking the constants of the theory; but they appear to be reasonably probable.

Radiation Pressure.—It is found that the pressure of radiation plays a very important part in the development of the masses of stars. As already mentioned the stellar material is highly opaque to the radiation; thus the outward radiation exerts a large pressure on the absorbing material, tending to support part of its weight. The fraction of the weight carried by the radiation is the quantity \(( t - \delta )\) in the formula already given. For example (taking molecular weight 30) we find:

For star of mass \( \frac{1}{2} \) sun pressure supports 0.044 of weight

\[ \delta \times 0.457 \]

This gives a clue to the remarkable phenomenon that the masses of the stars are in the same ratio to their actual weight that the masses of the stars of the universe have aggregated into lumps, whose size is almost always between \( \frac{1}{2} \) and 5 x sun? We see that this is just the range for which radiation pressure rises from insignificance to importance, and presumably that fact has determined the size of such masses. On general grounds it is likely that when radiation pressure counterbalances a considerable part of gravitation, the body would be very liable to disruption; accordingly the chances of such a body being massive and more than a few thousand times the sun would be small. The material thus tended to divide and subdivide until the separate masses fell just below the danger limit, fixed by this criterion of radiation pressure; and afterwards there was no cause for further division.

Age of the Stars.—In discussions of the evolution and dynamics of the stars or of systems of stars, the problem arises: What is the time-scale of the process? If astronomers were asked to estimate the length of life of a star from its first luminescence to its final extinction, the answers would probably fall into three groups: (a) The short time-scale, urged by Kelvin, giving a life of about 20 million years; (b) a long time-scale, say 100 years; (c) an ultra-long time-scale of 10^8 years and upwards urged by those who believe the stellar universe to have approached recently the gravitational equilibrium. The short time-scale rests on weak foundations, and the ultra-long time-scale assumes that the gravitational energy converted as it contracts; in recent years, the cumulative evidence against this "contraction theory" of a star's energy has become very considerable, and it now seems clear that the star must have some much longer store to draw on.

The Cepheid variables may perhaps afford us a measure of the rate at which the evolution proceeds. Like other giant stars, \( \delta \) Cephei would need to condense very rapidly if the energy which it radiates came solely from contraction: the increase of density must in fact amount to \( 1/3 \) in 40 years. As already explained the rate of radiation and the luminosity of \( \delta \) Cephei. However, may change as the density changes. Calculation shows that the period ought to decrease 40 seconds annually. Now \( \delta \) Cephei has been under careful observation since 1785 and the decrease of period is only just detectable. The value given by E. Hertz spring is a decrease of 0.08 second per annum. Thus at this present stage evolution is proceeding at a rate no more than \( 1/3 \) of that required by the contraction hypothesis; and some source of energy is being drawn on to prolong the star's life 100-fold. Assuming that this store of energy is contained in the star (and not picked up continually from space), it seems clear that it must consist of the sub-atomic energy, releasable when the elements are transmuted or possibly when positive and negative electrons annihilate one another. Since all kinds of energy possess mass, an upper limit to the store can be given; the sun's output of heat could be maintained for \( 10^8 \) years if all the energy contained in it were liberated.

III. Instriments

The Hooker telescope, a reflector of 100 in. aperture, installed at the Mount Wilson Observatory, is now (1915) the most powerful telescope in the world. It was brought into regular use in 1910. The mirror is a glass disc of thickness 12.8 in. at the edge and 11.6 in. at the centre, weighing over four tons. It is ground to a focal length of 1288 metres, but can be used with convex mirrors as a Cassegrain with equivalent focal lengths of 48 and 76 metres. The weight on the polar axis is mainly buoyed by cylinders floating in mercury. A 72-in. reflector has been erected at Victoria, B.C. Both these large telescopes are giving excellent performance.

A comparatively small telescope of interesting design was constructed by the late B. Cookson at Cambridge; it is a photographic zenith telescope carried on an anulus which floats in mercury. Rotation about the vertical is thus secured by flotation instead of by reading spirit levels. After Cookson's death the instrument was removed to Greenwich, where it has been used with great success for determining latitude variation and the constant of aberration. From seven years' observations the value 20°44" 1°013 was obtained for the constant of aberration; this is probably the best direct determination of the constant, though scarcely so accurate as the value 20°47" obtained indirectly from the solar parallax. A somewhat similar instrument in which rotation about the vertical is obtained by suspension instead of by flotation has been recently installed at Durham Observatory.

An appliance very much used in recent years is a coarse grating consisting of parallel and equidistant metal strips placed in front of the object glass. This grating, with say five "lines" to the inch, seems like a travey of the diffraction gratings used by physicists; but the action is essentially the same. On either side of the undiffracted image of the star subsidiary images appear, which are in reciprocal spectra of the first, second and higher orders. The distance between the two first order images is proportional to the average wave-length of the light; and hence the grating can be used for determining star colour on a quantitative scale. It also provides a convenient means of obtaining images whose intensities are in a definitely known ratio (calculated from the widths of the strips and spaces), which is of great value in determining an absolute scale of photographic magnitudes. These objective gratings appear to have been first used by K. Schwarzschild acting on a suggestion from A. A. Michelson. Another optical device, suggested by A. A. Michelson so long ago as 1886, has recently been developed by W. W. Ross and T. C. Wilson. An interferometer consists essentially of two light-collectors of moderate aperture separated by a base-line of considerable length (as in a range-finder). The beams of light are then brought together, so that for a point source they produce the usual interference fringes. As the base-line extends or contracts the fringes narrow or widen in proportion. For a double star a length and orientation of the base-line can be found in which the bright fringes of one component fall on the dark intervals of the other component, so that the visibility of the fringes is a minimum. In this way the position angle and separation of the components can be measured with great accuracy, and the method is applicable to double stars too close to be resolved in a telescope; in fact the resolving power of the interferometer is greater than that of a telescope of aperture equal to the base-line. At Mount
Wilson's excellent observations were obtained by this means of Capella (hitherto known only as a spectroscopic binary), the separation of the components being 0"144. A more interesting application was the measurement for the first time of the angular diameter of a star; this has been accomplished for Betelgeuse (which has an angular diameter of any star); a base-line of 10 ft. was required for the disappearance of the fringes. The diameter of Arcturus has also been measured, the fringes disappearing when the base-line was 10 feet.

The photo-electric cell has been the means of great advance in stellar photometry. Films of the metallic alkali emit electrons in numbers proportional to the intensity of the light falling on them. The light of a star is allowed to enter a cell coated with such a film and the rate of discharge of electrons is measured with an electrometer. In all other methods of photometry the effect observed is nearly proportional to the magnitude and the photo-electric method is the only one which shows the luminosity directly and not distorted on a logarithmic scale.

A "Stereocomparator" is often used for detecting proper motions between two plates taken at different epochs. The plates are arranged so as to be viewed one with each eye and combined stereoscopically; stars which have moved appreciably between the two epochs will betray themselves by appearing to stand out in front of or behind the general plane.

In the modification called the "Blink-Microscope" the two plates are viewed in rapid alternation; and a motion or change of brightness is at once detected.

The following recent books on various branches of the subject will be found useful:—C. G. Abbot, The Sun (1912); W. W. Campbell, Stellar Motions (1913); A. S. Eddington, Stellar Movements and the Structure of the Universe (1914); R. G. Atten, The Binary Stars (1918); H. H. Jeans, Problems of Cosmogony and Stellar Dynamics (1919). Lick Observatory Publications, vol. xii., is a mine of information as to the Nebulae. (A. S. E.)

ATHLETICS—see Sports and Games.

ATHOS, MOUNT (see Sports and Games).—In the summer of 1913 the monks of Mount Athos were convulsed by the controversy arising out of the heresy of the Name of God. A Russian monk named Ilarion, in the western Caucasus, had published a book, under the title of In the Mountains of the Caucasus, in which he argued that the Name of God, being part of God, is divine, and therefore to be worshipped. The book was printed at the Pechersk monastery at Kiev, esteemed the special press of the Holy Synod, and its popularity is shown by the fact that it passed into three editions. Its teaching as to the name of God, which claimed to be based on the authority of such eminent scholars as Ilarion himself, was attacked by a Missionary of the Rev. E. J. de Riem, who was welcomed with enthusiasm by the monks of the monasteries of St. Andrew and St. Panteleimon, its chief exponent being Antony Bulatovich, an ex-officer of the Hussars of the Guard, who had become a monk at St. Andrew's.

The crisis began when Archbishop Anthony of Volyn denounced the book as heretical. The monks appealed against this to the Holy Synod; but the latter decided against them and ordered the abbeys to repress the heresy. The monks thereupon expelled the abbots by force, and their action was approved by the monachic authorities at Volotov, the Greek parent house of St. Andrew's. On the appeal of the abbots the dispute was now referred by the Holy Synod to the court of the Patriarch of Constantinople, and the intervention of the Russian Government was asked for. This was the controversy about the "Name of God." The Patriarch was induced to repudiate theOTALYm by the community of Vatopedi, and at the instance of the Russian ambassador at Constantinople the refractory monasteries were subjected to pressure.

This failed to subdue the monks, whom the Archbishop of Volyn described as "a band of soft-brained idiots led by a vainglorious hussar." It was feared that the heresy, if made official, would spread throughout the entire patriarchate. In the meantime, Archibishop Nikon was sent to Athos to threaten the recalcitrant brethren with severe temporal and eternal penalties should they remain obstinate. But his reception was worse than cold, and the Russian Government determined to take strong measures. On June 24, 200 Russian soldiers landed on Mount Athos, and a month later 600 of the monks were deported to Russia, where they were distributed as prisoners in various monasteries. The Holy Synod decided that the peculiar tenets of Bulatovich and his followers were to be known and condemned as "the heresy of the Name of God.

The Times, June 19 and 26, 1913.

AUCTION BRIDGE: see BRIDGE, AUCTION.

AUFENBERG-KOMAROW, MORITZ, Freiherr von (1832—), Austrian general of infantry, was born in Troppau. As a young staff officer he served in the army which occupied Bosnia in 1878. He later commanded the XV. Army Corps at Serajevo, and in the autumn of 1911 became Minister of War. The ambitious general had many enemies. His active spirit led him to take a vigorous part in the internal politics of the monarchy, his knowledge of the Hungarian and more especially of the Southern Slav question being intimate. He had attracted the attention of the heir to the throne, the Archduke Francis Ferdinand, who, had in spite of much opposition, secured his appointment as Minister of War; but powerful influences forced him to retire after only a year and a quarter's tenure of the office. He won his title in the World War, as the commander of the IV. Army against the Russians, by the brilliant victory of Komarow at the end of Aug. 1914. After the victory Aufenberg succeeded in the difficult operation of completely changing the front of his entire army, with which he moved southwards in time to take part in the second battle of Lemberg; but the superior strength of the enemy made it impossible for him to hold his position, and he was then ordered to resign his command. In April 1915 he was arrested on an accusation of having as War Minister delivered an unauthorized person a copy of military instructions with a view to speculation on the Exchange, but the court acquitted him.

Aufenberg wrote two books: Aus Oesterreich-Ungarns Teilnahme am Weltkriege and Aus Oesterreichs Hohe und Niedergang.

AUSTIN, ALFRED (1835—1913), English poet (see 2,038), died June 2, 1913 at Swinfen Old Manor, near Ashford, Kent. His autobiography appeared in 1911. He was succeeded in the laureateship by Robert Bridges.

AUSTRALIA (see 2,041).—Including as it does the adjacent Torres Straits, but excluding the Papuan Territory (area 91,000 sq.m.), the area of the Australian mainland was in 1921 computed at 2,974,581 sq.m., or 1,145,320 of which, about five-sixths of the total, are within the tropical zone. Between 1902 and 1911, when the Commonwealth was proclaimed, and 1911, when there had been three changes affecting the political boundaries of Australia. In 1906 Papua (the British portion of the island of New Guinea) was taken over from the British Government and constituted a Territory of the Commonwealth. In 1909 the Commonwealth took over an area in the S. of New South Wales which was constituted a Federal Territory and on which was to be built the Federal Capital. In 1911 the Northern Territories was taken over from S. Australia and constituted a Federal Territory. The effect of the World War in giving to the Australian Commonwealth, as mandatory under the League of Nations, control of what was German New Guinea and of other ex-German possessions.
sions in the Pacific area (roughly about 90,000 sq. m.) does not, strictly speaking, make any change in the area of the Australian Commonwealth since these "mandated" territories are not annexed.

Papua.—The suitableness of Papua for various forms of tropical agriculture is undoubtedly, but there is a "labor difficulty" in the west. The Kaiapit, Kelit, and Sea hunters of the interior have an aversion to steady work. In Fiji, a British colony in the S. Pacific, a position similar to that existing in Papua has been met by the importing of indigeneous coolies from India to develop the sugar plantations. In the Australian Overseas Settlement, however, is determined to keep Papua for the Papuans. It was proposed in 1908 that the Papuan should be forced to do a certain amount of work, either for himself or the private planters, on the argument that consuming advanced as the Papuan nature so bountifully afforded him, and in reasonable comfort without work, he would never be driven to labour by necessity, and must, therefore, be brought under some other form of compulsion. The Australian Government vetoed the proposal. In 1918, however, a Native Taxes Ordinance was passed authorizing a tax not exceeding 1/- per head on all natives except those in Government employ, or unfit for work, or having four or more living children. The proceeds of the tax will be applied to the benefit of the natives; its effect is designed to stimulate industry on their part. In 1919 about 13,000 natives were in some form employed on the Native Land Ordinance, and the Native Land, Mission and Currency Ordinance safeguard the interests of the native workers.

There are about 38,513 ac. under cultivation, mostly planted with coco-nut trees. Rubber, cotton, sisal, and coffee are also grown and may be considered of potential importance. The system of land tenure is by leasehold; freeholds are not granted; the condition of leasing are not onerous (see New Guinea).

The Federal Territory and Federal Capital Site.—The constitution has created a Federal Capital Territory. An outport of the capital city will be within the state of New South Wales, at least 100 m. from Sydney, the New South Wales Government in 1909 surrendered to the Commonwealth the area of territory between Yass-Capran, and also an area of 2 sq. m. on the shores of Jervis Bay for the construction of a Federal port; and with these areas went the right to construct a railway from this port to the Federal Territory.

In 1910 the Federal Government took possession of the Territory. It established there in 1911 a military college and later a naval college at Jervis Bay. In 1913 the work of constructing the Federal city was begun; and a railway from Jervis Bay to the Federal Territory was opened in 1914. The World War seriously interfered with further progress and work on the Federal city was still in abeyance in 1921. About 9,000,000 had been spent.

The Northern Territory.—With an area of 523,072 sq. m. (more than one-sixth of the continent), having some very fertile land, and with a better river system than most other parts of Australia, the Northern Territory was to a marked extent underdeveloped. About 10,000 pop. (other than aborigines) = 4,706 in 1911. The backwash of the Territory as compared with the rest of Australia is due chiefly to political causes. When the Australian colonies first set up separate governments the Northern Territory was a remnant of the old Spanish possession, and it was left in the hands of the Imperial Government. In 1863 South Australia took over the responsibility for the Territory, and it was then called South Australia, with Darwin as its capital. In 1911 the Territory was transferred to the Commonwealth, and a railway was opened from Darwin to the port of Charlotte Bay. With such railway it would have been brought within the ambit of South Australian development. Without that railway it was actually more remote from communication with South Australia than with any other of the States. The railway was begun. It reached Pine Creek from Port Darwin in the N. end, and Oodnadatta from Adelaide at the S. end; then hope of its completion was abandoned. When the Commonwealth came into existence it sought a transfer of the Northern Territory from South Australia. But it was not until Jan. 1, 1911 that the final stage of the negotiations was reached and the Territory assumed by the Commonwealth. The transfers of these two territories with the rest of South Australia in the administration of the Territory should be regarded by the Commonwealth, and that the trans-continental railway should be completed from Port Darwin in the N. to Port Augusta (-both under the control of the Commonwealth-, the existing state railway from Port Augusta to Oodnadatta. It has not yet been found possible to go on with this railway project, but the east-west trans-continental railway being completed, the north-eastern section will be developed.

In 1912 the Commonwealth Government appointed an administrator for the Northern Territory and took preliminary steps for its development. Agriculture, particularly, is of importance, the population flourishing in this tropical part of the continent the evidence is reassuring. There is very little malaria, and other specific tropical diseases are absent. The land is generally considered to be productive, and there is a natural increase there due to sheep-farming and dairy-farming on the tablelands. There is said to be mineral wealth, but mining results in the past have usually been disappointing. In its policy of development the Australian Government does not propose to allow any further complete alienation of Crown lands. All titles will be limited to the length of lease, with the retransfer at the end of each term of 10 years, every 4 years in the case of town lands, every 21 years in the case of agricultural and pastoral lands. Up to the present the Northern Territory has not proved a profitable acquisition for the Commonwealth. The area is 1,471,304 sq. m., with a population of 537,760 on an expenditure of £497,301. The administration has been disturbed by troubles similar in character to those which the New Guinea Territory had with the Australian colonists in the early days of Australian settlement.

The Commonwealth

The Federal Act of July 1900 (see 2,966) united in an indis- soluble Australian Commonwealth six self-governing colonies, organized as British settlements between 1770 and 1859, which retain their individuality and, for certain purposes, their independence. The federating states, New South Wales (see 19,537 sq. m.), Victoria (see 28,357 sq. m.), Queensland (see 22,723 sq. m.), South Australia (see 25,492 sq. m.), Western Australia (see 28,539 sq. m.) and Tasmania (see 26,438 sq. m.) were left with certain self-governing powers and preserved their own political institutions. Separate notes are added later as to certain details in the internal affairs of the individual states, but in the following account Australia will be considered substantially as a whole, in its aspect of a single national unit.

Population.—Public opinion in Australia has at different times considerably varied as to the rate of increase of the population, both by natural increase and by immigration. There are probably causes that the natural increase of the population was as sufficient as that led to the appointment of the Birth Rate Royal Commission. It was held by the Commonwealth Commission on Secret Drugs and Cures which reported observed that a very careful attention to the matter of artificial limitation of families. It was observed fairly clearly by the fact that these was no natural cause predisposing to sterility in Australia, but that the desire for comfort conducted to a somewhat natural artificial limitation of families. As a consequence of this condition of things, some pronouncement again the "suicide" of population in the Commonwealth steadily improved until 1914 when, as a consequence of the World War, there was a very marked decline. Possibly a healthier public opinion following on the report of the Birth Rate Commission was in part responsible.

Possible contributory causes were a great increase in material prosperity following upon federation, and an influx of immigrants who were long habituated to family limitation. It was observed as a consequence that the"suicide" of population in the Commonwealth steadily improved until 1914 when, as a consequence of the World War, there was a very marked decline. Possibly a healthier public opinion following on the report of the Birth Rate Commission was in part responsible.

factor of Australia. During 1911-5 the Commonwealth gained 90,393 by immigration; during 1916-9, 24,016.

A preliminary census count of the census of 1921 gave the population of the Commonwealth as 5,419,702, an increase of 955,721 since 1911. The federal statistics are as follows: New South Wales 2,096,393, increase 449,669; Victoria 1,530,114, increase 214,813; Queensland 755,573, increase 149,760; South Australia 494,367, increase 72,113; Western Australia 329,226, increase 82,474; Tasmania 213,572, increase 22,316.

The population included 2,751,781 males and 2,665,921 females. In Victoria there was an excess of females over males of 22,224. Fertility, as measured by births, also shows a larger increase from country districts than from the cities. The proportion of whites to the coloured race is almost equal; but the proportion of whites in the territories being insignificant. In accordance with these returns New South Wales would gain an extra seat in the House of Representatives, and Victoria lose one.

Social Conditions.—The Australian people are almost wholly British in character; 97-5% of the total are of British origin, 1-21% come from France, and 0-44% from German, Italian, and other European countries. The average standard of education is high and illiteracy almost unknown. The wage rate is generally high. The cost of living in Australia compares well with the cost in most civilized countries. In 1871 the statistician to the Commonwealth Government, Mr. G. H. Knibbs, instituted an enquiry into the cost of living. Taking four sets of family budgets, (a) of families with £200 a year and over, divided into families of four members and under four members, (b) of families with less than £200 a year, divided similarly, he found that the average percentage of income spent on housing was 13-70, on food 29-10, on clothing 12-72, on fuel and light 3-46, on rent 2-10, on insurance, education, and charities 2-72. Last year the total income was £4,700,000, of which £1,923,074 was spent on the functions of government, the United Kingdom, and a general average of over 50% in all other countries for which statistics were available. The cost of living showed in Australia a lower increase consequent upon the war than in most countries. For example, taking £72 as the index number for Sydney in 1913, that index number had risen to 268 (not much more than 50%) in 1919.

The marriage rate was 28-25 in 1913 and 23-75 in 1919. The marriage rate (number of marriages per 1,000 of mean pop.) was 7-88 in 1919. The celebration of a marriage is more easily effected in Australia than in England. There is much family life for divorced persons, and various states, divorces being granted more readily in New South Wales and Victoria than in the other states. The total of Australian divorces in 1915 was 721.

A striking feature of Australian social life is the preponderance of the urban over the rural population. In South Australia more than one-half of the total population of the state (380,000 sq. m. in extent) is concentrated in the city of Adelaide. In Victoria 50% in New South Wales 41% of the total population is in one city, and in the whole Commonwealth 42% of the population is contained within six cities. The charm of the cities is great; the conditions in the out-of-town districts are often hard. The Australian goes to town for his wages and city for his recreation. The habits of the farmers' goods, by pushing such of the conveniences of civilization as are under state control as far forward as possible, and by other means, much more sanguine of control than the centrality of the cities. It finds very much of its own resources and its future. The total urban population in 1911 was 1,591,708.

Public Health.—Though part of Australia is within the tropics, there is practically no tropical disease, and there is an absence of small-pox, hydrophobia and other diseases which are known in some parts of Europe. The death-rate from all causes in 1919 was 12-8. It was rising last year, but it is determined not to be allowed to go on. It has been a betterment in regard to the infantile death-rate, which the hot summers ruling over the greater part of the Commonwealth make the chief cause of public health anxiety. In 1901 it stood at 154 per 1,000 births. In 1909 it was 60 per thousand. The Commonwealth Government pays a maternity bonus of £3 for every child born of a white woman resident in Australia. All the states have public health organizations to deal specially with infant welfare. Apart from European, the other chief items of public life are tuberculosis, cancer, diseases of the heart and violence.

Education.—The Australian system of elementary education is free and compulsory to all. The secondary education is not free, but a generous system of bursaries makes education to the stage of a university degree available to the poorest in most states. There is also a good system of agricultural and technical colleges. The residential college at the University of Queensland is an international religion taught in the state schools; but private denominational schools exist, being maintained especially by the Roman Catholic Church.

Production and Industry.—The early stage of the federation was marked by a period of depression which lasted for a time the development of prosperity. From 1905 the growth of prosperity was very great until the check given by the World War and another severe drought. The disturbance to economic conditions caused by that war takes away a great deal of the value of comparative figures. The following figures appear, as regards 1918, more favourable than they really are since the value of £25,000,000 of produce in 1914 had depreciated seriously since 1914. Total Commonwealth production: 1909 £174,195,000; 1913 £218,103,000; 1918 £298,669,000. Australia is chiefly a pastoral country and her pastoral products represent nearly one-half of the total value of production. Her exports in the pastoral industry in 1918 last were valued at £75,624,791. Drought is still a serious enemy of this industry and the effects of recent droughts are quite apparent. The tremendous increase in the value of the wool in 1918-19 was at the expense of the sheep industry, which showed a fall of 6 million sheep. This fall to 69 millions in 1915, grew to 87 millions in 1918 and in 1919 fell to 84 millions. Cattle have done better and in 1919 had reached the highest record number, nearly 13 millions. The wool produced during the year 1919-20 amounted to a little over £1,000,000, 1918 produced £58,000,000, and in 1918 produced £53,000,000.

The manufacturing industries of Australia progress each year, and it is clear that the British and American manufacturer must reckon on strong Australian competition in Pacific markets. In 1909 the manufacturing industries produced £40,000,000, in 1918 £75,000,000. (i.e. added that value to raw materials).

In spite of the drain upon manpower and capital during the World War Australia's industrial development has continued, under the influence of a strongly protective tariff, is entering each year on new fields of industry. In the iron and steel industry one new concern is producing 300,000 tons of steel a year. In shipbuilding Australian costs are producing at the present moment lower than those of Great Britain; in 1923 a protective duty of 25% is to be imposed on British ships and of 30% on foreign ships coming to trade in Australian waters. Australia is making a vigorous effort also to encourage the wooden textile industry, and there is mooted a project to give Federal Government assistance to raise a capital of £14,000,000 for textile mills. Easily accessible coal on the mainland and excellent water power in Tasmania favor large development of a great mining industry. In 1912 the Australian Government offered bounties for Australian-cured fish. Nothing material resulted.

Trade and Commerce.—After federation the overseas trade of the Commonwealth increased at a rate of 40,000,000; the recent figures have been—

The bulk of Australia's trade is with Great Britain, and a preference of treating with Australia is desired by Great Britain and as opposed to foreign trade. As a consequence of the war there was a very marked decline of British imports. The following figures of Australian imports will illustrate—

This is chiefly a war result. Whilst British industry was to a large extent paralyzed, the United States and British possessions captured a larger share of the Australian markets. But a slight (very slight) decline in British imports was noticeable before the war and after the granting of a preferential tariff. It is hardly reasonable to expect that British imports will ever go back fully to their old position in the Australian market. Australian imports are of a very large kind showed a dwindling proportion of the total before the war. War regulations, confining the export of certain products to Great
Australia

British, temporarily arrested that decrease. Taking quintennial periods from 1899, the first would show an average of 49-56 of exports to the United Kingdom, the second an average of 46-88, the third an average of 45-14. The war period 1914-9 showed an average of 53-12.

Australia's trade with Asiatic countries develops steadily; exports to these countries were valued at $4,500,000 in 1901 and $19,000,000 in 1919.

Communications.—There has been a great railway development in Australia since the foundation of the Commonwealth. In 1901 the total railway mileage was 10,123; in 1919 it was 25,657. Nearly all the lines are owned by the Commonwealth, or the states. The main railway line from the Australian railway from Port Augusta to Kalgoorlie was opened, and the five capital cities of the mainland are now linked by rail. The distance between the farthest points, Port Augusta and Sydney, is 6,475 miles. Another trans-Australian railway, crossing the continent from N. to S., is contemplated. Unfortunately there are four different gauges in use on Australian main lines in the various states; the question of the standardization of gauge is under consideration, a capital cost of the Commonwealth-owned railways had reached to $9,095,000 in 1919; revenue did not meet working expenses. The various state-owned railways by the same cost had $243,975,000.

On these working expenses absorbed 72-26% of the gross revenue, and the net revenue gave a return of 3-01% on the cost of construction. It has to be kept in mind that all the Commonwealth lines and also a small part of the railway area are quite new, and that they were built in advance of the settlement which would make them payable. The Commonwealth adopted a policy of Government-owned shipping and of closer control of private shipping. Up to 1912 Australiawas a considerable contributor of revenue in the acquisition of Australian coastal trade as much as possible for Australian ships, and insisted that all ships engaging in Australian coastal trade should observe Australian conditions in regard to wages, etc., etc. The Commonwealth also considered that the cost of the war left the shipping in Canada in a condition barely sufficient to meet its obligations. The fact that there was no shipping of the United States at this time and the need for closer control of the shipping trade led to the establishment of the Commonwealth-owned lines. The Commonwealth Government因而 bought for the Commonwealth 15 steamers, each of about 7,000 tons, and a local building programme for 48 vessels was announced, with an additional programme for 12 ships. Subsequently the local building programme was cancelled as regards 22 of the vessels; the local building programme for steel vessels (24) was continued, and six of them were running in 1921. In addition the Commonwealth Government had 18 ex-enemy steamers and one ex-enemy sailing vessel under its control.

In Feb., 1917, a Commonwealth Shipping Board was set up to control all Commonwealth shipping matters; it has two committees, one for the trade within the Empire, and one for interstate trade with headquarters at Melbourne. It has, inter alia, powers to divert privately-owned interstate shipping to overseas services; it has powers to impose and collect duties; it has the power to regulate the State ownership of shipping or the close State control of shipping, and there are indications that it may be abandoned. The total overseas shipping entered and cleared in Australia in 1913 was 1,572,015 tons; in 1919, 2,106,482 tons. Australia's tonnage in foreign trade was 75% of the total in 1913 and 78-90% in 1918-9. Two ports of Australia, Sydney and Melbourne, exceed in shipping tonnage entered the figures for all British ports except London and Liverpool.

Finance (Public).—The Commonwealth Government, which at its inception had a share of the customs and excise as its only great source of taxation, now collects customs and excise, land tax, probate duties, income tax, entertainments tax and special war taxes. Its revenue from taxation and from services was $21,741,000 in 1913-4 and $44,716,918 in 1918-9. The rate of revenue collected per head had increased from 4-9s. 1d. to 8s. 17s. 9d. The Australian, in addition to the usual state taxes, has a federal duty of 3d. per head of adult males on incomes over $500, a state taxation per head is 6d. 11s. 6d. and the total taxation per head 50s. 9s. 3d. Out of the customs and excise revenue collected by the Commonwealth a fixed sum of 25c. per head per year is paid to the states as a contribution to the electoral funds and land tax of the states to duties and probate duties. Out of the Commonwealth revenue is met all defence votes and costs of Federal services.

The first Commonwealth Government and the state Governments both have power, and exercise it freely, to raise funds by public borrowing, but all the states except New South Wales admit some control on the part of the Commonwealth of their borrowings. The World War brought a financial crisis to the Commonwealth. The Government owed $24,600,000, of which $22,800,000 was held in Australia. The various states owed $5,060,000,000, of which $5,160,000,000 was held in Australia. The balance in each case was mainly held in the United States. The Australian debt, both Federal and state, was fully represented by revenue-producing assets such as railways. That could be said of the total ($37,900,000) in 1914 but not of the total in 1920 ($572,000,000), the difference being mostly represented by unproductive war expenditure. Of the state debts a total of about $55,000,000 was due to the Commonwealth Government, and that sum should be deducted from the $722,000,000 to calculate the actual debt load on the Australian people. In 1910 the Commonwealth Government took over the payment of the state debts and secured the right to take over all the state debts and consolidate them into one Federal issue. The power had not yet been exercised in 1921.

A Commonwealth bank of issue was opened in 1912. Its operations received a credit in 1913 when the Commonwealth Parliament granted it to purchase the bank business and has a "Savings Bank" section. It issued notes to the value of $57,000,000 by 1920 and held a gold reserve of 41-17% against them.

Finance (Private).—There are 21 private banks trading in Australia, of which four have their head offices in London. In 1919 their paid-up capital totalled $5,566,000, and their reserved profits $2,000,000. Their total liabilities were $275,634,000, and their total capital and reserves were $277,950,000. Depositors in savings banks numbered 2,914,000 (more than half the population) and the average deposit was $43 12s. 7d. or $25 per head of the whole population.

Government.—Under the Federal constitution the Commonwealth is governed by a governor-general appointed by the British Crown and acting on the advice of a Cabinet which is responsible to an Australian Parliament of 70 Houses. The Senate represents the states and is composed of six members from each state, elected for six years by the adults of the state voting in mass every three years to return three senators; the House of Representatives is about double the Senate in numbers (73), represents the people numerically, and is elected every three years by the adults of Australia voting in single-member electorates, which are approximately equal in population. The commonwealth Parliament has no control over the powers set forth in the constitution. The High Court is the final court of that constitution and may veto any legislation, either of the states or of the Commonwealth, which is sultus virens.

Political History

The Commonwealth of Australia was formed in 1901 by the union of the six states of New South Wales, Victoria, Queensland, South Australia, Western Australia and Tasmania. The first Government of the Union was formed by Sir Edmund (later Mr.) Barton (born in N.S.W. 1849, d. 1920). Mr. Barton entered the N.S.W. Assembly as member for the university of Sydney in 1879. His enthusiasm was aroused for the cause of the Federation of Australia. After the death of Sir Henry Parkes he assumed the leadership of the Federal movement. The convention which framed the Federal constitution had recognized Mr. Barton's services by electing him as its leader. Now as Federal Prime Minister he called to his side the premiers of all the federating states; with one exception they responded; and this ministry of all the talents appealed to the people for support on a non-party form.

The Early Parliaments, 1901-7.—The first Federal Parliament was however divided into three parties, that following Sir Edmund Barton, that following the Free Trade leader, Sir George Reid (born in Scotland in 1845, d. 1918), and the Labour party, under the leadership of one of the remarkable men of Australian public life, Mr. J. C. Watson. Born of poor Scottish parents in 1867 while on the voyage to Australia, Mr. Watson was in boyhood deprived of nearly all the advantages of education, but taught himself enough to become a printer. Suggestive, taciturn, conciliatory, he came into politics from the Associations. Mr. Watson was Prime Minister and was elected first leader of the Federal Labour party. The success of the Labour party under his leadership at the polls was extraordinary. The first Parliament of the Commonwealth, divided as between the Government followers and Mr. Reid's Opposition party almost equally, had the Labour party holding the balance of power. This made a position of difficulty for the Government. The common-sense and moderation of Mr. Watson saved the situation to some extent. He gave a general support to the Government and assisted them in their most pressing tasks. Nevertheless the first Parliament was compared by party factions in the Opposition and the party of the Labour party over to their side, and the Government being forced to postpone a good deal, to modify a good deal, in order to keep in office. Sir Edmund Barton was deeply disappointed. He had looked to a first
patriotic Parliament completing without any "scuffling on the steps of the temple"—to use his own phrase—the measures necessary for the stability of the Federation. He experienced a first Parliament in which party rancour was extraordinarily rife. He retired to accept a Federal judgeship, and Mr. Deakin (born in Victoria in 1836, d. 1915) took his place (Sept. 1903).

Mr. Alfred Deakin met the second Parliament of the Commonwealth in 1904 with his own following reduced, the following of the Labour party increased. In April 1904 Mr. Deakin went out of office and was succeeded by Mr. Watson. In Aug. of the same year Mr. Deakin gave his support temporarily to Mr. George Reid, and Mr. Reid's administration supplanted Mr. Watson's. This lasted through a long recess and a few days of parliamentary life, and in July 1905 Mr. Deakin came back to office with the support of Mr. Watson. Mr. Watson was at that time determined on resignation from political life as he could not keep pace with the extremist elements in the Labour party. But he was strongly convinced that a measure of tariff reform was necessary, and resolved to remain in Parliament until it was effected. The first Federal tariff had had to make concessions to Free Trade sentiment. The second tariff was completely protectionist, and introduced a new principle into Australian politics by granting a "preference" to British imports. At the third general election in 1907 the Labour party again improved its position, mostly at the expense of its allies.

Mr. Watson kept the leadership of the Labour party, and kept that party solidly behind Mr. Deakin, until the tariff was settled. Then he retired and Mr. Andrew Fisher took his place. Born in Scotland in 1852 Mr. Fisher was brought up as a coal-miner. He went to Queensland in 1885, entered the state Parliament and later the Federal Parliament. He had been included in Mr. Watson's Cabinet. Now, assuming the leadership, he very quickly gave Mr. Deakin notice to quit, and in 1908 formed his own administration. It lasted little more than six months. Mr. Deakin then formed a coalition with the remnants of the Free Trade Opposition, no longer led by Mr. George Reid but by Mr. Joseph Cook (born in England in 1886), and the Deakin-Cook administration came into office. One of its first acts was to send Mr. George Reid to London as a first High Commissioner for the Commonwealth; Mr. Reid, on assuming this office, accepted a knighthood. Mr. Cook, like Mr. Fisher, had been a miner. He entered the New South Wales Parliament as a Labour member, drifted away from his party and entered the Federal Parliament as a Free Trader. He now joined with Mr. Deakin to oust the Labour party from office, one ground of attack being their lack of proper sympathy with the cause of Imperial defence.

Australia's War Forebodings.—This was at the time of the European crisis over Austria's annexation of Bosnia-Herzegovina, when public interest throughout the British Empire was being stirred over the question of maintaining British supremacy at sea and of strengthening the hands of the Imperial Government in view of increasing international complications. New Zealand had promptly offered to provide a "Dreadnought cruiser type" of ship for the British navy. It was objected that Mr. Fisher had not done likewise. He claimed that his Imperial patriotism was not wanting, but that in his judgment more useful action could be taken by hurrying on with the creation of an Australian navy. This navy, he stated in a despatch to the British Government, would be organized and controlled by Australia in times of peace, but on the outbreak of war would automatically pass to the control of the British Admiralty. Amid bitter party wrangles the third Australian Parliament closed its life in Jan. 1910. The general election of 1910 resulted in a victory for the Labour party under Mr. Fisher. The peace party was defeated in both the Senate and the House of Representatives. The decision which gave Australia's destinies completely into the hands of the Labour party (and that not the Labour party of Mr. Watson, but of Mr. Fisher—much more of a "party" man) was influenced very largely by negative considerations. The people disliked deeply the coalition of Mr. Deakin with Mr. Cook, who had before seemed to represent absolutely irreconcilable ideas in politics; and a vote for the Labour party was in many cases a vote of non-confidence in the coalition rather than actually an endorsement of Labour policy. An indication of this fact was given a little later, when the Labour Government (May 1911) submitted to a direct poll of the people certain amendments of the Federal constitution, without which it could not carry out its Labour policy. These amendments sought (a) to give the Commonwealth Parliament full power to legislate with respect to trade and commerce instead of the limited power it had under the constitution (the limitation stood in the way of Federal legislation dealing with the conditions of labour); (b) to give the Commonwealth civil list, criminal jurisdiction in all parts of the Commonwealth; (c) to give the Commonwealth Parliament specific power to deal with the wages and conditions of labour and with labour disputes; (d) to give the Commonwealth Parliament power to deal with all combinations and monopolies. A further proposed amendment of the constitution was to give the Commonwealth Parliament power to declare that any business was a "monopoly," and, following such declaration, to acquire it, paying on just terms for any property used in connexion with it. By a majority of about 250,000 votes in a total poll of about 1,450,000 votes the people declared against these amendments in any form.

The Fisher Government soon cleared itself very completely of any suspicion of a lack of earnestness regarding the defence of Australia and the Empire. In 1909, whilst Mr. Deakin was Prime Minister, an Act of Parliament had been passed enforcing military training on all able-bodied male citizens. This enactment of universal service had not been opposed by the Labour party. Indeed their criticism was that the system proposed to be enforced was not thorough enough; and the Government of the day promised that an expert from Great Britain should be asked to report on the system. Field-Marshal Viscount Kitchener accepted an invitation to visit Australia, and his report came before the Parliament of 1910 with a Labour Government in power. That Government not only accepted all his recommendations but in some cases crossed his "i's" and dotted his "t's." There was established a system of universal training for military defence which Lord Kitchener guaranteed as adequate and with which the Fisher Government enforced against various protests with a resolute courage. In the matter of naval defence the Fisher Government was equally firm in dissociating itself from any falttering policy. A Commonwealth Navy came into actual being as a fleet unit in 1913 when the battle cruiser "Australia." ("Dreadnought cruiser type") and the light cruisers "Melbourne" and "Sydney" arrived in Australian waters.

The same year the King laid the foundation-stone in London of Australia House, the splendid headquarters of the Commonwealth High Commissioner. A further step in the organization of the new nation was the appointment of the Inter-state Commission, which, under the constitution, has power to adjudicate on and administer all laws relating to trade and commerce. It acts as a sort of a commercial High Court. Among its powers is that of preventing any preferential or discriminatory rates on the state railways.

The general elections in 1913 were unfavourable to the Fisher Government, and Mr. Joseph Cook took office with a majority in the House of Representatives but not in the Senate. His Government kept office under very difficult circumstances almost until the outbreak of the World War. On July 30 1914 the governor-general dissolved both Houses of Parliament, and in the general election that followed the Labour party won a majority both in the House of Representatives and in the Senate. The Labour party, with its "extremist" policies and its war work, was not very popular; but the general election of 1914 was not successful and Mr. Fisher formed his fourth administration in Sept. 1914. He gave up the Prime Ministry shortly afterwards to become High Commissioner in London and was succeeded by Mr. W. M. Hughes, his chief colleague. Mr. Hughes (born in Wales in 1864) on coming to Australia was forced to many strange shifts to make a livelihood. But entering the N.S.W. Parliament as a Labour member of the "extremist" kind he soon proved himself to have ability and
fighting force of a rare order. Though subject to weak health, and later handicapped by deafness, he fought his way to the front rank by sheer grit. Sold down the river for volunteers at the coming to the head of the Government in war-time he had fine scope for his combative genius. He earned bitter hatreds as well as generous praise in Europe and in his own country from 1914 to 1921.

**Australia in the World War.**—The gallant deeds of the Australian naval and military forces in the World War cannot be separated conveniently from the general history of the campaign, and there will be noted here only the political and civil developments. Australia entered the war with an enthusiasm of patriotism, which obscured for a time any open sign of the fact that there was a section of the population which reflected closely the opinions of the Irish Nationalist party. About a third of the Australian population is of Irish origin; of this third the majority were (and are) more Australian than Irish in their national outlook, but a fraction of them have always inclined to give a first place to their Irish sympathies. Some dignitaries of the Roman Catholic hierarchy (which is largely Irish in origin and in education) have done much to encourage this fraction. As the war developed and an opposition to the British cause grew up in Irish circles, the Government and Mr. Hughes held that it was sufficient to stand in the way of a whole-hearted prosecution of the war; nor did Irish Australians as a class refuse to take their share of the war's perils. But it was sufficient to prevent in 1916 and again in 1917 the passing of a referendum to enforce conscription for service overseas because it was able then to enlist on its side a genuine Australian feeling, partly made up of an objection to conscription as under the circumstances supererogatory, and partly arising from personal hostility to Mr. Hughes.

A full understanding of the Australian character is needed to reconcile some apparently conflicting circumstances from 1914 to 1918. At the outbreak of the war Australia had a fleet being developed which was at once transferred to the British Admiralty and did most useful work in the Pacific and in European waters. There was never a suggestion to tie it down to home waters nor to limit its best strategic use as determined by the British Admiralty. On the military side Australia had instituted a compulsory National Defence system for home defence, and this system was far enough advanced to be of some use in the recruiting of an Australian army. But the nation relied, as did Great Britain at the outset, on voluntary enlistment for overseas service. There was no partiality on the part of the Government to force the enlistment of the Aborigines. By the end of the year Australian forces had seized the German Pacific possessions, troops had been offered for service abroad and 31,000 had left Australia for Egypt. In 1915 the Australian Expeditionary Force went through the unhappy Gallipoli campaign, and in 1916 was taking a distinguished part in France and in the Near East. The number of Australian divisions serving abroad represented a full quota of its manhood (five divisions to represent five million people).

When in 1916 conscription was proposed, that section of the Irish Australian people which, following the unhappy course of events in Ireland, had become hostile to Great Britain, opposed it (as did some other sections of the people). Their influence was sufficient to defeat this proposal, partly because it was understood that Mr. Hughes, the Prime Minister, would resign if his proposal were defeated, and many wished him to resign; but chiefly because the Australians felt that—to use their own vernacular—they were doing a fair thing, anyhow. Since, in all, Australia sent 329,683 troops abroad, and they suffered 317,933 casualties (58,961 killed) and incurred war expenditure totalling £288,000,000 it cannot be said that there was any half-hearted Australian participation in the World War, though the result of injudicious political action was at one time to give that impression. Indeed the Australian national character came out of the test of the war very well. The Australian troops, the "Anzacs," as they came to be known from the initials A.N.Z.A.C. (Australia-New Zealand Army Corps), won a splendid reputation for courage and steadfastness. The Australian civil population bore without murmuring the heart-breaking losses of the Gallipoli expedition and the devastation—smaller as regards loss of life but more cruft in its needless sacrifice—of the outbreak of venereal disease following the location of their young troops near the source of Cairo. When an Australian corps was formed in France under an Australian leader, Lt.-Gen. Sir John Monash, and did really conspicuous service in 1918, Australian pride knew no bounds. Lt.-Gen. Sir John Monash was one of the figures of the war. Born of Jewish parents at Melbourne 1865 he graduated at Melbourne University as a civil engineer. In 1887 he received a commission in the Australian militia as a lieutenant and thereafter took a passionate interest in military history and military science. At the outbreak of the war he was at first appointed military censor in Australia with the rank of colonel. Later he served throughout the Gallipoli campaign and in Egypt, and then as G.O.C. the Third Australian Division in France. Finally, in May 1918 he was given command of the Australian Corps. In this command he proved conspicuous ability and energy. His first operation at Hamel, July 4 1918, had the distinction of being made the subject of a special staff brochure by the British General Staff.

Sir John Monash tells his own story of the campaign in *The Australian Victories in France in 1918*, British military opinion of this book was described as "the standard work for all Australians.

Australia has made generous provision for her ex-service men. Pensions payable for total disability range from £2 2s. to £3 a week according to rank, with extra provision for a wife and all children under 16. A totally disabled soldier with wife and five children gets £3 17s. 6d. a week. Ex-soldiers and sailors are helped liberally to re-establish themselves in civil life. Cooperating with the state Governments the Commonwealth Government has made available farming lands, and grants and loans for houses, working capital, etc.

Before the war German trade and industry had strong footholds in Australia, German shipping lines and German metal companies in particular. Indeed the Germans had almost a monopoly of the treatment of Australian base metal ores. On the outbreak of war, steps were taken to extirpate all German interests in Australia, and the legislation against enemy property, and for the internment of enemy subjects, was far more severe than in Great Britain at the time. The German had never been popular in Australia as a trader, and there was some reflection in the vigour of the special war legislation of old hostility to a people who came under the suspicion of "not playing the game." Australia and the Peace.—Mr. Hughes as Minister for Defence during the war many political crises to face. His war attitude—which was ultra-vigorous—was very warmly approved by Great Britain by those who thought that Mr. Asquith's Government was somewhat slow in taking the necessary steps. This approval, expressed as it was with perhaps an excess of zeal, did not make things easier for Mr. Hughes with some Australians, who conceived the suspicion that he was "playing to the London gallery," No more deadly charge could be brought against a colonial politician than that. The Australian people are fervent in their Imperial loyalty, but they have always been jealous of "Downing Street interference," and somewhat suspicious of a London popularity for their leaders.

Internal dissensions forced a reconstruction of Mr. Hughes's Cabinet in Nov. 1916. Mr. Hughes and the Labour party drifted further apart and in 1917 he broke with them definitely, and, after an appeal to the country, formed a new ministry mainly from the ranks of the Opposition and including only three of his old Labour colleagues. A later appeal to the electors at the end of 1919 was destructive to the power of the Labour party (which was actively assisted by the "Irish party") both in the Senate and the House of Representatives, but brought into being a new group, "the Country party," which represents chiefly agricultural interests. Mr. Hughes formed a new Government in Jan. 1918, but up to 1921 it had had a somewhat precarious existence and had been subject to serious internal dissensions. None of these home political troubles, however, diverted Mr. Hughes from his campaign against the German enemy and against British elements which he considered to be not earnest enough.
in their antagonism to Germany. He was in London for a long term during the war, and in 1919 was in Paris as the Australian representative to the Peace Conference. One result of the World War had been to define the character of the British dominions as that of independent nations under the Crown. Mr. Hughes at the Peace Conference took full advantage of this new status, and vigorously fought for his idea of a peace much more punitive in terms to Germany than that actually agreed to.

He was always in opposition to Mr. Wilson, often in opposition to Mr. Lloyd George. He wanted from Germany a full indemnity covering all war costs. He objected to any authority being granted to the League of Nations over ex-German territories in the Pacific which, he contended, should be straightforwardly annexed to Australia. Curiously enough, in this attitude of hostility toward Germany, which was more than merely a question of sectioning of the British public by his Australian constituents. He was acclaimed by many of these latter, but, returning to Australia, did not find the nation united under his leadership. His Cabinet was afterwards in a constant state of crisis, and early in 1921 it was rumoured that he would give up the Prime Ministership and come to London as High Commissioner, an office which Mr. Fisher had just vacated. But Mr. Hughes attended the Imperial Conference in London in June 1921 as Prime Minister.

The Constitution and the High Court.—The Federal constitution, in so far as it grants power by the Federal Parliament to declare, by the power of the states from trespass by the Federation, necessarily set up a system of conservative check. But the full extent of that check was only understood when a High Court began to interpret various statutes and declared the constitution as to which only the amount of the legislation of the Australian Parliament has been declared ultra vires by the High Court. Some of the decisions affecting the constitution were such that it was not only sought to amend the constitution so as to facilitate "Labour" legislation, but this effort failed. The power to amend the constitution is subject to many safeguards. A proposed amendment must first have the approval of an absolute majority of both Houses of Parliament; it must then be submitted to a poll of the people, and to pass must secure (a) a majority of the total votes cast; (b) a majority of the votes cast in a majority of the states. If the three largest states voted "Yes" and the three smallest states voted "No," the proposed amendment would still fail.

In 1906 the Australian Parliament had passed an "Excise Act" which was intended to enforce what was called the "New Protection," a high protective duty. It was on the power of the states to impose taxes on commodities imported locally, with the provision that the excuse duty should be remitted if the manufacturers paid "fair wages." On June 26, 1908 the High Court declared this Act invalid, on the ground that it was not what it purported to be—a tax Act, but rather an Act to regulate wages within a state, a thing which the Federal power was not competent to undertake under the constitution.

The first two Australian Parliaments devoted much time to discussing the question of control of federal state servants, which included control state railway servants. This inclusion was nullified by a High Court decision that it was an unconstitutional interference by the Federal power with the affairs of the states. In the Trade Marks Act the Australian Parliament gave trade unions the right to register what is known in the United States as the "Union label," a mark showing that certain goods were manufactured by trade-union labour only. The Australian High Court (Aug. 1908) set this part of the statute aside on the ground that such a "Union label" was not a genuine trade mark, and the proposal to register it as a trade mark was really a subterfuge to assume control of labour conditions which were controlled by the Commonwealth of the Continent.

Not only Federal legislation but state legislation has been vetoed. An Arbitration Act in N.S.W. had sought to give the wildest powers of regulating industrial disputes. In a series of five judgments the High Court of New South Wales nullified a section of the Arbitration Act that it was more than half destroyed. (The High Court is the only court of appeal in cases affecting the constitution, and is with the Privy Council an alternative court of appeal in all other cases.)

A federal amendment to the Constitution which would legalize for the future the labour legislation which the High Court had nullified was then submitted to referenda and, as interpreted by the High Court, remains a barrier against any great development of socialistic enterprise on the part of the Commonwealth Government. In its working the Australian constitution is the most conservative instrument of Government within the British Empire.

Industrial Disputes.—Australia has elaborate machinery in Commonwealth and state Arbitration Courts for the settlement of industrial disputes without strikes. But strikes are very frequent and do grave damage to the development of the country. They are directed against the state as an employer as well as against private employers. The strike on the Victorian state railways in 1903 was followed in 1908 by a strike on the Sydney state tramways. Both strikes were settled after long disputes. In 1910 the New South Wales Government let go of all the tramways and the railways and state employees were in 1912 out of work due to disputes. Stern measures were taken by the New South Wales Government to repress these strikes, and the leaders in the strike movement were arrested and some of them punished with imprisonment. At present there were several strikes in New South Wales and of transport workers at Adelaide (S. Aust.). In 1912 the tramway employees of Brisbane came out on strike because of a slight grievance; their strike was at first supported by many of the public and had some sympathy. There was an attempt to pass a Bill by the Queensland Government to declare the strike "syndicalist" lines, calling out the workers in every industry with the avowed object of preventing all business. Serious riots accompanied the strike. The state Government first acted to stop these disorders and the Bill was crushed and the syndicalist movement defeated.

The World War did not stop strikes. In 1914 and again in 1916 there were serious coal strikes. Working-days lost through strikes in successive years were: 1913, 625,000; 1914, 1,000,000; 1915, 810,000; 1916, 1,675,000; 1917, 4,500,000; 1918, 580,000; 1919, 5,652,000. The losses in wages through strikes during the period 1913-9 were certainly not at all, and giving roughly but some of the total pop. is only 5,000,000. The statistics as to the method of setting strikes force the conclusion that the legal industrial arbitration machinery is not effective—of 460 disputes settled in 1910 only 38 were decided after court action. There were 642 cases under the Arbitration Courts and nine by the Commonwealth Arbitration Courts.

The Tariff.—The Australian tariff is protective, with a rebate on some of its rates for British productions. The first tariff passed in 1860, which extended a protective duty to the fields of manufacture, was rather strongly protective but made a "preference" concession to British manufacture. Successive changes since have been always in the direction of increasing protection, but the tariff has always been straightforwardly protective. The principle of the preferential system is "Free Trade within the British Empire, a tax on all others." The principle of the preferential system is "Free Trade within the British Empire, a tax on all others." Britain was always a major factor in the tariff changes. The Tariff Board was established in 1903 under the Commonwealth Act and in 1917 acted as a tariff board in Australia also. The 5,700,000 is the number of the tariff. The tariff is based on the principle that the object of a tariff is to give the British Empire an advantage over all other British Empire, and that it is chargeable to the British Empire as a whole, and not to any one of the dominions. The British Empire is the most valuable asset of any British Empire.
forces another class of exemption; the residents of the far “Outback” areas and other rural training for which funds are not present are left out of the scheme. A Staff College in the Federal Territory is provided for the training of officers, and its organization is on severely practical lines. Cadets are accepted after examination. The course, under the direction of the senior instructors, is divided by those who are expert in the use of arms, and parents are forbidden to supplement the mess allowance by private pocket-money. Even railway fares to and from the college are paid. The student’s daily fare is about £4 2s. 6d. as are also all costs of uniform and equipment. A severe but not unwholesome discipline is exacted; the drinking of alcoholic liquors and cigarette smoking are both forbidden in the college. The needs of cadets in the college are met largely by a subsidy from England or in Asia, after which graduates are available for staff appointments in Australia and New Zealand (the latter dominion shares in the carrying of the college). During the World War the entire building was occupied by a force of British cadets, some of whom were specially graduated for service at the front. The college provides for 150 cadets.

As, after training, the citizen soldier passes into a reserve, the potential military resources of the Commonwealth in the future are only to be calculated by the total number of males of “military age,” minus those who had been exempted from training. On the basis of the present population there would be 366,000 males between the ages of 18 and 26; 330,000 between 26 and 35, and a further 614,000 between 35 and 40. Exemptions, at a broad guess, might be 25%. The organization of an army is clearly of the first importance. Australia was represented at an Imperial Defence Conference in 1909, which showed a remarkable change of opinion on the subject of “local navies” on the part of the British Admiralty. They brought down to the Conference, as a substitute for an Australian subsidy on the British navy, a proposal for the building of an independent Australian fleet unit with a help of a British subsidy of £250,000. This scheme was ultimately dropped in 1911, except that it refused to accept the subsidy and decided to put the whole cost on the Australian taxpayer. Under this scheme Australia was to provide a fleet unit with a “Dreadnought” cruiser as its centre piece.

In March 1911, at the request of the Australian Government, and at the close of a visit to Australia, Admiral Sir Reginald Henderson reported on the naval needs of the Commonwealth. His report was actuated by the desire of the people of the Commonwealth for defence. In 1919 Admiral of the Fleet Lord Jellicoe visited Australia to advise the Commonwealth as to their naval programme in the light of the lessons of the war. In 1921 a special conference was held at Singapore to consider the Pacific naval position. It was announced by the British Admiralty early in 1921 that British naval policy (especially in regard to a battleship programme) would not be finally decided upon until after discussion with the dominions. Thus the wheel had come full circle from the British Admiralty attitude of 1907, which discountenanced any dominion naval action except a financial support for the British navy, to the decision that the Australian navy must be not finally settled without consulting the dominions.

The Australian naval organization has a naval college at Jervis Bay for the education of naval officers. The scheme follows that of Great Britain exactly except that all expenses of the cadets are met by the Commonwealth Government and parents pay no fees. There is also a training-ship at Sydney for the training of other ranks. The Australian naval organization is not large, and is for the protection of the navy station. It has a fleet of 30 surface warships headed by the battle cruiser "Australia," six submarines, and various auxiliaries.

Australia’s defence expenditure (naval and military) in 1905 was £1,564,590 and in 1919 £2,002,631. In 1905 it had 53,184 regulars and 12,588- the fleet of 38,000,000, and the estimates for 1919-20 were for £1,629,000.

The visit of the Prince of Wales to Australia in 1920 was marked by a great enthusiasm and many demonstrations. An effort was made by the Irish party and an extremist Labour section to strike a discordant note. It failed completely. The Australian soldiers in France had been won by the Prince’s qualities of courage, dutifulness and charm to what may be called without exaggeration a devoted admiration. They gave the lead to Australian public sentiment in the welcome of the royal visitor.

NEW SOUTH WALES

The area of New South Wales is computed at 309,472 square miles. The state has progressed rapidly since federation. The pop. in 1890 was 1,364,990 and in 1919 2,002,631. In 1908 New South Wales re-established a system of assisted immigration. The city of Sydney has shown a remarkable growth since federation, and in 1912 a "Million Club" was formed to foster the growth of the city, which has 1,000,000 inhabitants. In 1890 it was £25,750.

Politically, New South Wales was the original headquarters of the Australian Labour party; its state Parliament is usually controlled by the Labour party and the Premier in 1921 was the Hon. John Howey, leader of the Labour party. At the time of the Union, New South Wales was the centre of anti-federation, and its hesitancy to throw in its lot with the other states caused some delay in realizing the Federation. A certain anti-federal spirit persists, and is shown in the fact that the state8 has not subscribed to many of its borrowings. No state has benefited more from the Union, the effect of which tends to group most of the great industries of the Commonwealth around the New South Wales cities. A recent development of great importance was the foundation of steel manufacture at Newcastle.

Besides Sydney (the greatest port of Australia and the chief export for the American, the Asiatic and the Pacific trade), New South Wales has notable cities in Newcastle—the centre of the coal mining industry—Broken Hill, a great silver, zinc and lead-mining city on the f.w. of the state; Tamworth, Bathurst, Goulburn, Wagga and Albany. As, by the time of the Census, the state was 2,430,000.

The governor in 1921 was Sir Walter Davidson.

VICTORIA

Since Federation the pop. increased from 1,107,296 to 1,495,938 (1919). State-aided immigration was never extensively practiced. The vigorous policy of closer settlement has been adopted. Before the Union Victoria had established by a high protective tariff a lead in the manufacturing industries. That lead has now passed to New South Wales. Victoria is, however, developing with energy her agricultural interests, and has lately made good progress with intensive fruit-growing on the banks of the river Murray. The area under all crops in 1919 was 3,942,000 acres. Victoria is a centre of the Commonwealth. As temporary seat of the Commonwealth Government, Melbourne (pop. 743,000), the capital of Victoria, is also the political capital of Australia, and the housing of the chief Federal departments there has given some impetus to the city’s growth. Since the inauguration of the Federation it has been improved greatly in appearance by a scheme of tree decoration applied to the river banks and the chief streets.

The governor in 1921 was Sir Archibald William Weigall.

SOUTH AUSTRALIA

S. Australia has an area of 380,970 sq. m. and a pop. in 1919 of 426,914, having been relieved of the care of the Northern Territory. The state is facing the development of its dry belt, where wheat-growing has been found to be possible with a very low average rainfall. In 1919 the area under wheat was 1,713,157, in 1919 1,893,349 acres.

In politics South Australia has always been very progressive in spirit. It was the first state to enfranchise women and most of the "social reform" legislation of Australia originated here.

The governor in 1921 was Sir Francis Newdigate Newdegate.

WESTERN AUSTRALIA

The pop. was 331,660 in 1919. The state has had for many years a system of state-aided immigration. The backwardness in development of this, the largest of the states, is being met by a vigorous land settlement policy. The state had 1,605,000 ac. under crop, mostly wheat. The gold yield is dwindling. In 1918 it was 876,512 oz. compared with 1,955,770 oz. in 1909. But W. Australia is still by far the largest producer of gold in Australia.

The governor in 1921 was Sir Matthew Nathan.

QUEENSLAND

The pop. was 725,220 in 1919; the state has progressed greatly since federation. The Produkt of Queensland to the Australian states it develops its railways from several maritime centres instead of from the one capital city. The sugar industry is a great source of Queensland wealth, and some anxiety was formerly felt as to whether the "white flour" policy of the Commonwealth would not ruin this industry. That anxiety no longer exists.

Politically the state is one of the strongholds of the Labour party, and in 1919 its Labour Government was strongly criticized to Great Britain for passing a budget which was widely believed to be repudiating the conditions under which British capital had been advanced for pastoral development.

The governor in 1921 was Sir Matthew Nathan.
AUSTRALIAN LITERATURE—AUSTRIA, UPPER

TASMANIA
With a very mild climate, in which drought is unknown, Tasman (pop. in 1919, 216,757) is destined to be the garden, orchard and small-culture farm of the mainland. A vast area, now being developed is that of the production of electricity from water-power. A great industrial future is promised from the utilization of the Great Lake water-power, and there has been talk even of carrying electric power by cables across to the mainland.

The governor in 1921 was Sir William Altadice.

(A.F.F.)

AUSTRALIAN LITERATURE.—Australia's beginning was from a literary standpoint unfortunate. The primitive aborigines had no history and no legendary lore which, finding expression through some of the first colonists, might have added to the world's stock of romance. The exploring of the continent—the siege of the Blue Mountains with their baffling natural fortifications, the conquest of the great fastnesses of the sun on the dry inland plains—might have inspired an epic, but no one of the explorers nor of their contemporaries attempted more than a bare record.

The soiled convict crew inspired one book—For the Term of his Natural Life (1874), by Marcus Clarke—which is made notable by its subject rather than its treatment. The bush-ranging era inspired another—Robbery Under Arms (1888), by "Rolf Boldrewood" (T. A. Browne)—of which the same may be said. Those are the two master works of early Australian letters. Yet neither is distinctively Australian in the sense of showing a different outlook on life or a different sense of literary values, to that of the average contemporary English writer. The same may be said of the poems of Adam Lindsay Gordon, who wrote in Australia of Australian subjects from the standpoint of an English aquire.

At a later epoch, when there was less promise of Australian letters, there came the beginning of a Canadian Australian literature giving great promise which as yet has not been fulfilled. The people—bred from the wilder and more enterprising of English, Scottish and Irish stock, responding to the influence of the bountiful, sometimes fierce, sunshine, and to conditions of life which are singularly free from any bonds of convention and tend to the levelling of social conditions—have departed somewhat from the home type. They are gay and debonair, whilst a little inclined to be cynical, irreverent and vainglorious; enduring and brave, even to the point of being somewhat ruthless. The qualities of these new people, the Australians, begin to show in their literature, which is as yet more impressive in quantity than in quality. There are at least one hundred minor poets of some skill and originality of thought in Australia (with five million inhabitants), and nearly that number of prose writers of distinction—all showing to the close observer some signs to distinguish them from writers of the same class in Great Britain and in America.

A hedonistic joy in life, a disrespect for authority, a wit tinged with cruelty, a freakish humour founded on wild exaggeration—those are the qualities which outcrop most often in exploring the fields of contemporary Australian literature. There is to be found, too, a tinge of mystic melancholy, a sense of bitterness—a loving bitterness—inspired by the harsh realities of life in the "bush" where Nature makes great demands on human endurance before permitting her conquest, and enslaves her woors by her very cruelty.

This modern Australian literature owed very much to one man—J. F. Archibald (1858-1919). He was of partly Scotch, partly Irish, partly French forbears, with a touch of Semitic blood. Editor for a quarter of a century of a notable Australian periodical of the Great Lake water-power, and young Australians to write of the life that was peculiar to Australia. He was a wit with a fine flair for a phrase; a sentimental cynic; and passionately Australian. Mainly under his aegis there came forward a young school of writers which included Henry Hertzberg Lawson (b. 1867), who has given in short stories and verse faithful, sometimes terrible, glimpses of the "bush"; and Arthur Benton ("Banjo") Paterson (b. 1864), a singer of the rackets, horsey life of Australian sheep stations; George Louis Becke (1848-1913), who pictured South Sea Island life; Arthur Hoey Davis (" Steele Rudd"), (b. 1868), who writes broadly, rightly and yet sympathetic studies of life on the small farms of Australia; Roderic Quinn (b. 1860), and the late Victor Daley (both of Irish extraction and giving in their verse two different and yet both characteristically Australian modifications of Celtic melancholy); Edwin James Brady (b. 1869), writer of sea songs; Ethel Turner (Mrs. H. R. Curlewis, b. 1872), English-born but Australian by education, a graceful novelist of Australian childhood; Bernard O'Dowd (b. 1866); Barbara Baynton, Mary Gault, James Francis Daywer (b. 1874) and many others. Some of these owed much, some little, directly to Archibald and his newspaper. But without a doubt he was the chief founder of a new Australian literary movement.

Within the decade 1910-20 there was very little that was characteristically Australian in the literary product of the southern continent. An exception must be made for The Sentimental Blake, by C. J. Dennis, a collection of verse which showed original qualities of humour and sentiment. A distinctively Australian literary magazine, The Lone Hand, faded away after a period of apparently vigorous life.

Australian letters suffer from diffused energy. There are numberless writers of some ability, but no commanding figures. The future holds out a hope of Australian work of the first rank, inspired perhaps by the "bush"—the mysterious Neolithic-age forests, hills and plains—perhaps by the giant work of the early explorers, perhaps by the extremely fluid social conditions of a young country full of self-confidence as it grapples with the old, old problems of civilization.

The Australian newspaper press reproduces with close fidelity British press characteristics. The Melbourne morning journals, the Argus and the Age, followed into 23 districts and 3 capital cities, the municipalities of which are autonomous, viz.—Vienna, the capital, (pop. 1920) 1,842,005; Wiener-Neustadt 35,000, and Waidhofen an der Ybbs 4,740. Important foreign towns are: Baden (pop. 8,688; and with its suburbs 21,005); Bruck an der Leitha 6,007; Schwechat 8,528; Korneuburg 7,736; Stockerau 10,274; Krems 13,593; Mödling 17,704; Neunkirchen 17,059; St. Pölten 23,061; Klosterneuburg 13,341.

Of the total area 96.4% is productive, and of the productive area 45.3% is arable, 35.5% forested, 13.6% gardens, meadows, grazing-lands and 1.9% vineyards. The neighbourhood of Vorarlberg in Lower Austria is the chief industrial district of the new Austrian republic.

The Wiener-Neustadt—Vienna canal is now no longer used. At Graz, near by, are the only large coal-mines now belonging to Austria. In the hill country to the E. are lignite deposits, now mostly on-Hungarian territory, but partly in the Burgenland. Korneuburg is proposed as the starting-point of the projected Danube-Oder canal.

AUSTRIA, LOWER (see 3.1).—Lower Austria is bordered on the E. and N. by Hungary and Czechoslovakia; on the W. by Czechoslovakia and Upper Austria and on the S. by Styria. As the result of the losses of 1919 (Stadt-Felsberg and other places), Lower Austria extends over an area of about 7,639 sq. m. only. The pop. of the present Lower Austria was in 1910 3,525,904, but in 1920 it was reckoned at only 3,313,155 (434 per sq. m.). In 1910, 91.6% of the population were Roman Catholics, 5.2% Jews, 2.6% Evangelicals and most of the remainder belonged to the orthodox Greek faith. For administrative purposes, the province is divided into 23 districts and 3 cities, the municipalities of which are autonomous, viz.—Vienna, the capital, (pop. 1920) 1,842,005; Wiener-Neustadt 35,000, and Waidhofen an der Ybbs 4,740.

Important foreign towns are: Baden (pop. 8,688; and with its suburbs 21,005); Bruck an der Leitha 6,007; Schwechat 8,528; Korneuburg 7,736; Stockerau 10,274; Krems 13,593; Mödling 17,704; Neunkirchen 17,059; St. Pölten 23,061; Klosterneuburg 13,341.

Of the total area 96.4% is productive, and of the productive area 45.3% is arable, 35.5% forested, 13.6% gardens and meadows, grazing-lands and 1.9% vineyards. The neighbourhood of Vorarlberg in Lower Austria is the chief industrial district of the new Austrian republic.

The Wiener-Neustadt—Vienna canal is now no longer used. At Graz, near by, are the only large coal-mines now belonging to Austria. In the hill country to the E. are lignite deposits, now mostly on-Hungarian territory, but partly in the Burgenland. Korneuburg is proposed as the starting-point of the projected Danube-Oder canal.

AUSTRIA, UPPER (see 3.2).—Pop. in 1919, 583,005; in 1920, 587,734 (185 to the sq. m.). For administrative purposes, this territory is divided into 15 districts and two autonomous municipalities, Vienna, the capital (pop. (1920) 9,457 and 1925 (pop. 9,234). Other important places are: Melk (pop. 15,427); Bad Ischl (pop. 9,085; the town itself 5,291; Gmunden...
and not vigorous enough in their methods (Bach period, 1850-60).

A third experiment took the form of distributing over many harks a burden too heavy for one. In 1867 the Magyars accepted with alacrity this role in Hungary, the eastern half of the Dual Monarchy, while in the Cisleithanian territories the coöperation of the Poles was also sought. But this way too had to be given up, since even the smallest nationality would not allow itself to be absorbed and during the administration (1878) the idea came into favour of treating each nationality, and allowing it to grow, according to its own idiosyncrasies; they were only to be restricted so far as the unity of the state rendered it absolutely necessary. What Austria desired to be was a state at once conciliatory and just, and it opposed no national demand which did not overstep the limits of state security; but this loosing of bonds unchained at the same time a number of national passions before which the state retired step by step.

As to the details, the following observations may be made for the last phase of the empire which expired in 1918. The Germans had for long just given up all efforts to assert; their watch-word was "maintenance of the national status quo"—that is to say, not an aggressive but a defensive principle. It was in Bohemia that they had assumed the task of opening the way for national separation and protection against the Czechs of the territories which they had inhabited since the Middle Ages. The Germans of the Alpine lands were less ready to carry out the same resolve; in Tirol and Carinthia they were leading a divided policy of conciliatory and national independence. The reign of terror which followed the battle of the White Mountain was intended to remove all possibility of a fresh rising in the future. The Czechs rightly refer to this period 300 years ago when they describe themselves as a once oppressed nation. But in more recent times the position was different; the conquered race recovered, and a learned work, Die böhmische Nation, published in 1916 by the intellectual leaders of the nation, enlightens us as to their position. Dr. V. Zdenko Toloka, leader of the "Young Czechs" (i.e. the party which had frustrated the efforts of the Old Czechs for a reconciliation with the Germans) comments magnificently on the combined efforts of artists, industrial leaders and writers of Czech nationality, supported by a national subsidy; it can therefore be accepted as a trustworthy Czech autobiography. This comprehensive book describes the collection of the "Böhmisches Nationalmuseum", as the "nationalist" element in contrast to their present appellation of the Czechoslovak state.

It describes its material development, "its physical constitution and economic processes", of which "the measures and methods which have been made for its intellectual progress. In the sphere of education attention is drawn to the fact that 90-95% of the population of the Sudetic territories can both read and write: Our education is, next to the German, the best organized and stands decidedly the highest (p. 122).

Next follow chapters on the literary renovation of the nation, its progress in art, mathematics, chemistry and natural science; the magnificent development of agricultural, industrial, modern, commerce and finance; and in particular its flourishing self-government, "which will be exercised in the fullest freedom, and in which the communal organization embodies in the highest degree the union of self-government by every single district and the sphere of activity unlimited in its fundamental principle" (p. 235) in that "State control is exercised seldom and discreetly" (p. 236).

The control which is exercised over the land is in Czech hands since the country, as a result of the territorial changes, "is attached to a central part belonging to our nation" (p. 242). The influence of German culture is also remembered with gratitude. Of Palacky, the father of the nation, it says: "It was under the influence of Palacky that Palacky was able to turn his imagination, the national spirit of the Czechs in a national direction to this conscious Bohemian ideal of his. To cut oneself off from external cultural influences, especially from German ones, he declared to be a mistake." Besides mentioning the enormous legacies which it has bestowed, Goethe, Heine, Raumer, etc., on Czech poets and scholars, the book gives an appreciative account of the Emperor Joseph. The article on Jakubel on "the literary renaissance" says: The Prague theatre, which "first cultivated a more intimate and civic tone" under the reigned of Joseph II. into a powerful instrument of culture. Joseph's
enlightened despotism preserved to the Bohemian people at once an astonishing number of distinguished and progressive spirits. In Prof. Kadner’s annual address on liberation we read an organization which was bestowed by the famous May education laws of 1809. It was the liberal-minded Germans who were instrumental in the first place in getting them passed; while the Slavs from the beginning could not understand how and why a body of people—a House of Deputies—had been able to take a positive attitude towards the establishment of these laws. It should be difficult, after the copious details of this autobiography de luxe of the Czech nation in the year 1916, to speak of it historically as an opponent of Austria.

The Polest were, together with the Ruthenians, the youngest Austrian nation; the repeated partitions of Poland since the 18th century brought them unwillingly into the Austrian Empire. After the restoration of Poland (which was highly beneficial to the country), Galicia received after the Constitution of 1867 an exceptional position which was gradually consolidated; the German officials were removed, and the Polish language was introduced, which (by the 77 votes) held the balance between the parties, which brought Galicia, without any effort, great financial advantages at the cost of the other Crown territories. Up to the World War there was actually no articulate irredentism among the Austrian Poles; they were more contented than their co-nationals in Russia and Germany, and this explains their attitude of vacillation and indecision during a long period of the war.

The Lithuanians,—just as the Czechs had a majority in Bohemia, so had the Poles in Galicia; and they used their strength against the Ruthenians. The Austrian Government being largely dependent upon the Polish assistance of the Lithuanian schism, could not stand on the same footing on account of the far-reaching autonomy of the Galician Territorial Government. And so Russophil agitation found a fruitful soil, especially among the clergy and intellectuals. The Ruthenians were the only Austrian Empire, driven to the wall under the counter-revolution, without opposition, by the Polish authorities, who were interested in making the whole Ruthenian people suspect of irredentism. A grand campaign of agitation by the Russian Count Bobrinsky, whose watch-word was that the Russian banner must wave over the Carpathians, though winked at by the Polish governor, led to a great political trial (Dec. 29 1913) for high treasons to whom had been seduced in the Austrian Empire.

The Southern Slavs were divided among four countries: Austria, Hungary, Serbia and Montenegro. Ban Jelencze, though loyal to the Emperor, had given expression to their aspirations towards unity, and this was not only towards the end of the war that the Austrian Government, in response to the wishes of the Ruthenians, began to come round to the idea of a separate status for Eastern Galicia; but it was then too late, and the six million inhabitants of this province were left in their own hands.

The Southern Slavs were divided among four countries: Austria, Hungary, Serbia and Montenegro. Ban Jelencze, though loyal to the Emperor, had given expression to their aspirations towards unity, and this was not only towards the end of the war that the Austrian Government, in response to the wishes of the Ruthenians, began to come round to the idea of a separate status for Eastern Galicia; but it was then too late, and the six million inhabitants of this province were left in their own hands.

Of the three Latin races, Italian, Ladin and Rumanian, national fragments were to be found in Austria. The Italians and Ladiis, treated as a separate nation, were in the Austrian official statistics treated as a single national group (like the Czecho-Slovaks and Serbo-Croats), but even then only totalled together 2.75% of the population of the empire. The claim set up by the Italians to a university of their own within the territory inhabited by them led to certain compromises with the Germans and Southern Slavs. The Ladiis, who formed about a quarter of this group, were not affected by irredentism, but looked rather towards German culture, and were thus unimportant in the Austrian State. The Italian bourgeoisie of the towns, thanks to the force of attraction exercised by Italy, was all the more conspicuously irredentist, since the country population maintained an attitude of comparative opposition to the demands of the Ladiis, who inhabited the Southern states (Austria, Hungary and Rumania), the desire long prevalent for union within the monarchy, and Austria could only have had to stretch out their hand to them; but the Magyars would not have taken it. In the city of Trieste, the seemingly indivisible core of the Trieste Slovenes, who shared with the Rumanians, offered the spectacle of a German administration in which without any compulsion German was the only medium of communication; and nothing to the idea that the Germans nor language controversies were to be found. The Rumanians for years had proved themselves loyal to the State.

Constitution.—The establishment in Austria of universal suffrage in 1867 had as its aim the creation, in the place of the old Parliament, which was crippled by the strife of nationalities, of a Chamber in which social and economic interests should prevail over national ones. It had been believed that it was property owners and intellectuals who placed the question of nationality above all others, while behind them stood a solid mass of working people who were uncorrupted by nationalist chauvinism. The Social Democrats in particular had always expressed their willingness to adopt the Constitution of 1867, as evidenced by the March 30th law that year, when 77 deputies, of the 251 members, of the Social Democrats voted for the Constitution. The House of Deputies consisted of 516 members, of whom 221 were of Slav nationality, 277 of German nationality, and 87 Social Democrats, so that in every national controversy the latter could carry a decision in accordance with their principles. In spite of this, the calculation was defeated; for in Europe every true democracy at once becomes national, and hence the national problem infected the working-classes so soon as they won parliamentary power; the "International" split up into national groups, just as the bourgeoisie had done before it. Thus the motive force of nationality proved itself stronger than that of Socialism.

With the introduction of universal suffrage the stormy suffrage agitation came to rest, although one of its demands was unfilled, namely female suffrage for the Austrian House of Deputies. Active committees for women's rights were, it is true, set up in the territorial capitals. The election of a woman as a deputy to the Diet, which took place prematurely through their influence in Bohemia in 1912, was annulled by the governor as illegal. Women's activity was, for the rest, kept free from demonstrations and excesses. They were not, however, without quiet success, for these committees worked so intensively to create public opinion that the women's vote was immediately after the proclamation of the Austrian Republic in 1918 the vote was unanimously conceded to women, even the conservative parties agreeing to this.

It might have been expected that the concession of universal suffrage in the case of the House of Deputies would have led to the abolition of the class system of voting for the legislative bodies of the several territories and this did occur as a result of the demand of the three-class system of voting—established on the Russian model—in the case of the election of municipal representatives. This was all the more probable owing to the fact that since the Constitution of 1867 there had been a certain analogy between the franchise for the Reichsrat, the Territorial Diets, and the elected commercial bodies. The Social Democratic party endeavoured, indeed, to remove the last remains of the old electoral privilege in town and country; but the urgent moment in which they brought in to this effect as early as July 8 1908 broke down, owing to a not unfounded anxiety lest in the Crown territories of mixed population the vote should pass into German hands. There was only a cautious and gradual extension of the right to vote in Diet and municipal elections in the several territories; and it was not till Jan. 20 1918 that the Government was induced to adopt the principle of national voting for the Reichsrat, and to confirm an extension of the franchise, as established in the case of elections to the Reichsrat, to the communal elections also, but with reservations intended to guard against "the undesirable reaction of nationality in districts of mixed population." The principle of full equality of electoral rights in all three spheres was not carried out till the republic.

Parliament.—The activity of the Austrian Parliament can best be characterized as a continuous inactivity. The two great recurring "necessities of State," the budget and the authorization of the contingents of army recruits, regularly occupied a large part of the sittings; the budget was generally passed only in instalments in three or six monthly grants, and the Law (then) provided for a "cabinet law on the budget" (Law 1906) and provided for indispensable requirements in its absence by emergency decree.

The procedure of emergency decree was based upon Par. 14 of the constitution, which provided that: "When presssing necessity for such measures presents itself at a time when the Reichsrat is not sitting, they may be promulgated by imperial authority in so far as they do not produce any expense to the State treasury." The current administration could, it is true, be provided for by this means, but new commitments could not be entered upon. This resulted, indeed, in a fairly economical administration, but nothing could be done on an imposing scale. Par. 14 of the constitution also contained a safety valve which enabled the Government to carry on current business for a time without the cooperation of the Parliament. The Government repeatedly exposed itself to the charge of proroguing
AUSTRIAN EMPIRE

Parliament in order to avail itself of these emergency paragraphs. This procedure has often been blamed as unconstitutional; but the excuse must be taken into account that a constitution which provides such a course of action, can be credited as a very rare and extraordinary occurrence. The situation was often such that Parliament would not work, and the Government was faced with the alternative of stopping the machine of State or availing itself of the emergency powers of the Austrian Parliament. By an average every two years.

The Reichsrat's right of control was secured after the event by the fact that the Government was bound, the next time it assembled, to lay in its hands before the Reichsrat any commission or report issued within the last six months; and that it could not refuse ratification. But before the war the Reichsrat never exercised this right, and thus each time the Government's proceedings were whitewashed. It was only in 1917 that the emergency decree of the Austro-Hungarian Reichsrat and the purely military order of the Emperor of Austria, which was promulgated, failed to receive ratification, in retaliation for the suppression of trial by jury by a military trial and the extension over civilians of the jurisdiction of the military courts, decrees which were thereafter restored. On July 26 1914 Stirlígh had Parliament altogether, and non-parliamentary absolutism reigned for three years. At last Stirlígh's second successor again summoned the Reichsrat; but since its six years' mandate was expiring, it was prolonged by a special law towards the end of 1918. On the break-up of the State in 1918 the German deputies of this rump Parliament assembled to form the constituent national assembly of German Austria, while in the Bohemian and Lower Austrian states there were committees from which the German and Italian deputies were excluded, which proceeded to take measures toward a federal state.

Organized obstruction of parliamentary business by a section of members has been, of course, not confined to Austria. But it was in Austria that this singular procedure was first brought to technical perfection by the combination of the Reichsrat with the Departmental Chambers (Reichsrat). The Reichsrat from the first was an instrument which served this end. This was that every party had cause to fear parliamentary opposition at the hands of other nationalities, and this was why it was long impossible to reconcile the principal parties in the House to any effective remedy. It was not till the end of 1909 that this was achieved by a tightening of the standing orders.

The standing orders under which the business of the Reichsrat was conducted (1860) were intended for a dignified assembly of which each member aimed at avoiding disturbances. With the extension of the suffrage and the growth of nationalist conflicts, the powers of the president were no longer sufficient to control the unruly or unruly officials. Many of the problems of the house were of even a small group. At last, on Dec. 17 1909, after an 86-hour sitting, entirely occupied with debates on emergency motions, an emergency motion as to the new standing orders proposed by the Polish parish was passed; on the following day the Upper House adopted these resolutions, and on Dec. 20 1909 the new law was promulgated. By its provisions communications from the Government and the other House, and reports of commissions, had to take precedence of other business; further, the president could postpone to the end of the session formal motions, interpellations, emergency motions, and other obstructive measures. In the long run, however, every measure was to pass, on the work of the House being finished. A new stiffening of the standing orders was voted, which sufficed in effect during the later period of the Parliament.

Language Question.—There was no law regulating the question of which language was used in the parliamentary debates. Every deputy might speak in his mother tongue; but custom had brought it about that, in order to be understood by the whole House, the ministerial speeches were translated into the language understood by all. The Government that it became a frequent thing for individual Slav deputies to speak in their own language. These speeches were generally not recorded by the stenographer; the Slavs protected themselves against this by gradually getting it accepted that all speech of the ministers of the State should be translated into the Slavic tongue. Hence got stenographers should be appointed, that their speeches should be translated, and that they should be added as appendices to the parliamentary reports in the correct national language; finally it was resolved that the English, and especially the Slav speech in the parliamentary reports, in the language in which they were delivered. The Upper House agreed, but expressed its misgivings as to the procedure.

Administrative Commission for Bohemia.—In June 1913 the Government considered itself justified by necessity of the State in adopting a measure which in many respects was held to be a breach of the fundamental law of the State. The basis for this act was the presence of a large number of members of the Commission who were nominated by the State, to deal with the autonomous affairs of this country. Since the last election in the spring of 1908 the Bohemian Diet had been unworkable over a long time, and the Office of the Bohemian Diet, which had ceased to be a real Diet, was now a body of governmental officers, who saw themselves handed over hopelessly to the Czech majority, until a rearrangement of the voting groups (curia) should afford them a better chance of existence. This was the reason of the petition that each nationality should pay the costs of its own educational and cultural institutions, as otherwise one nationality would have to bear the expenses of the other, and vice versa. When the Czechs refused this request the Germans responded with more obstinate obstruction. The representative assembly now ceased to work, and since no legal expedient could in consequence be found by which legislation and current business could be carried on, the Government stepped in and appointed a mixed commission of Germans and Czechs, which should, as it was, administer the affairs of the lower house, and provide a permanent substitute for the other House. The new commission was admitted to have exercised its functions with impartiality as a matter of fact; but as a matter of form it stood on a basis of national representation. In consequence, the members were thereby deprived of their weapon of obstruction, and the Czechs were bringing their majority to oppress the Germans. The Czechs declared this to be a breach of the constitution; but the courts recognized the plight of the administration in this matter, and the commission was finally constituted in law. And so it subsisted until the break-up of the monarchy.

Administration.—The organization of the administrative system in the Austrian Empire was complicated by the fact that between the States and the ministries of the administration, the central authority was divided into three branches: (1) the States, which as early as the 18th century worked together in a common body of State administration; (2) the Localities (Landen); the State administration comprised all affairs having relation to these and similar matters, and common to all territories; (3) all other administrative tasks were left to the localities. The State authorities were divided on geographical lines into central, intermediate and local, and side by side with this there was a division of the offices for the transaction of business according to the nature of the business. The administrative system was based on the principle that the administrative tasks were divided among the authorities, which as early as the 18th century worked together in a common mother cell of the State chancery, became differentiated so soon as the question of administrative reform became discussed; in 1869 there were seven departments, and in the concluding decrees of the Austrian Empire there were set up Ministries of Labour, Food, Public Health and Social Care. Under these ministries came the State, administrative bodies and committees, which were called administrative organs (Kroned); but the immense variations in area of the Crown territories made a uniform and consistent intermediate administrative organization practically impossible. The lowest administrative unit was the political sub-district (Bezirk) under an official (Bariat, kaiypmann), who united nearly all the administrative functions which were divided among the various ministries according to their nature.

Side by side with the State administration certain Crown territory administrations also existed in the 17 Crown territories, carried on by selected honorary officials, having under them a staff of professional officials. Among the officials of these states there had great similarities with those of the State, so that their spheres of activity frequently overlapped and came into collision. This administrative organization was in itself double track, as it was called, led, it is true, in many cases to lively emulation, but was on the whole highly extravagant. The evils of this complicated system are obvious, and easy to condemn. They can be explained, partly by the origin of the State for the most part through a voluntary union of countries possessed by a strong sense of their own individuality—partly by the influence in Austria of the Germanic spirit, well understood by the Slavs, which has nothing of the Latin tendency to reduce all questions of administration to clerical administration as part of a clerical system. Like the English administrative system, the Austrian presented a rich variety, a variety indeed so rich that it clammed for a comprehensive reform.

Bienert's last act as premier in May 1911 was the appointment of a commission nominated by the Emperor, to draw up a scheme of administrative reform. So early as 1904 Korber had declared a comprehensive programme in the parliament of the State, to be in harmony with the spirit of the crops. But the machinery of State were to continue working. After seven years of inaction, however, this imperial rescript was pitched in a far lower key. The continuous progress of society, it said, had made increased demand on the administration, that is to say, it was assumed that reform was not demanded so much by the defects of the administration but by the progress of the times, not because the administration was bad, but because life was better. It was an attempt to reform the administration without actually changing the administrative system. A reform commission without a programme naturally first occupied itself with reforms about which there was no controversy. After a year or two, one by it, the commission was challenged by its critics, and the new officials. After another two years it had indeed brought to light carefully prepared material for study, which was of great scientific value; but its proposals, though politically of importance, did not extend to the practical administrative problems which were then pressing. The War broke out the commission dispersed without practical results, leaving behind it an imposing array of folio volumes of great scientific interest. It was only till March 1918 that the Seidler Government decided upon a programme for administrative reform, which was, however, never carried into effect. Education.—The organization of the Austrian elementary schools was based on the principle of compulsory school attendance, the imparting of public instruction in the child's own language. Side by side with these existing private schools. The proportion of children attending private schools to those attending the public elementary schools in 1912 was 11,000 to 12.5 millions; for the lower grades it was a thirteenth part. Hence the accusation of denationalizing children through the Schulvereine must be accepted with caution. The
all these ministries may be characterized as Cabinets composed of Government officials. Not one of their heads was drawn from the Chamber of Deputies. The Government was no longer the expression of the majority of the House, but had to be a non-party Government standing outside the House. An objective and non-party application of the laws, and equal rights for all nationalities, were in consequence the ever-recurring heads of the demands of those parties. The two most important ministries required a majority for the budget. They tried to arrive at it by negotiations with the parties, and by admitting to the Cabinet representatives of every nationality willing to coöperate. By this means the Cabinets acquired at least a measure of control over Parliament. A representative of Polish interests was generally to be found in every ministry, and usually too a minister of Czech and of German nationality. The political characteristics of these ministers are hardly distinguishable one from another; they all took their stand on a middle course of loyalty to the state and party impartiality. Beck, however, was held to be a shade more Slavophil, Riemer Germanophil, Gautsch dynastic, Stárghk a Conservative Socialist; Kibrka and Seidler were more officials, Clam-Martinitz an old aristocrat, Hussarek and Lammash-Clericals. They regarded it as their principal task to bring about a compromise between the nationalities, and this again depended on the outcome of the German-Czech negotiations which were always being started anew. In this none of these Austrian ministers succeeded.

Beck’s Ministry.—With the carrying through of suffrage reform the Beck Ministry, which started in June 1906, had exhausted its strength. On June 17 1907 a promising speech from the throne opened the first universal suffrage Parliament and promised “to leave to the peoples as a secure heritage the integrity of their national territories”; “to solve the language question... on a foundation of equality of rights”; “to organize education with an equal consideration for all races”; “to introduce insurance against old age and infirmity... social reforms with regard to female and night labour, and an extension of the participation of the State in the exploitation of the coal-mines.” Beck’s next success was in reaching an understanding as to the language to be employed in Parliament. He also succeeded (July 12 1908) in bringing about an imposing procession in honour of the Emperor as an opening to the festivities of his diamond jubilee (Dec. 1848-1908). But apart from this celebration the second period of the Beck Ministry was attended by unfortunate incidents. On April 12 1908 Count Potocki, the governor of Galicia, was shot by a Russian student. Then there was the Wahrmund affair. The Clericals started an agitation because Wahrmund, the professor of canon law at the university of Innsbruck, subjected the dogma of the Immaculate Conception to critical examination. They demanded from the Liberal Minister of Education, Marchlet, that disciplinary measures should be used against him. The Minister endeavoured on the one hand to safeguard the principle of freedom of instruction, and on the other hand to avoid anything resembling a Kulturkampf. A general strike at the universities was averted by a compromise, by which Wahrmund was transferred from the pious land of Tirol to Prague, which was more than he had desired. In July a Pan-Slavonic congress took place at Prague, accompanied by anti-German excesses which had a serious sequel in Liiabach. The Germans thereupon paralyzed the Prague Diet by means of obstruction, upon which the Czech members of the Beck Cabinet left it, and the prime minister, seeing himself abandoned by both Germans and Czechs, resigned on Nov. 14 1908. Shortly before this Beck had introduced yet another bill dealing with industrial insurance, to supplement the already existing sickness and accident insurance. The bill only received the assent of Parliament just before the break-up of the monarchy.

1 Baron Max Vladimir Beck (b. 1854) entered the service of the State in 1876; in 1900 became head of a section in the Ministry of Agriculture, in 1906-8 Prime Minister; in 1907 he got universal parliamentary suffrage accepted; he was responsible also for far-reaching measures of railway nationalization.
Bieniérth Ministry.—Beék’s successor Bieniérth 1 attempted to rule by means of a Cabinet of mere officials, in which under-secretares of State were appointed as temporary directors of their respective departments. Moreover the three chief nationalities, the Germans, Poles and Czechs, were each represented by a so-called national minister (Landsmanns-Minister). Bieniérth’s policy was to confine himself in a purely objective spirit to the execution of the laws until such time as he had gradually gained the confidence of the nation. The Germans made their cooperation contingent on various conditions. They insisted that the Government should introduce proposals as to the official language of functionaries, for they feared a return of the procedure used by Badení, which by means of a Government ordinance had altered the received usage and upset the national balance of power; that in Bohemia the purely German sub-districts (Bezirke) should be included in German districts (Kreise), and in like manner the purely Czech sub-districts in Czech districts, so that there would then be a relatively small number of territories of mixed nationality, which would have to be governed bilingually; that minorities should be protected by law; and that in appointing to posts in the offices of the autonomous Bohemian territorial Government, proportionate consideration should be given to the Germans, attention being paid to the fact that in Bohemia more than a third of the population were German, and that they paid more than half the taxes, but that the Czech national majority had appointed more than 90% of Czechs and not even 10% of Germans in the Government offices. In purely German territories moreover it was claimed that only German officials should be appointed, just as in purely Czech territories the appointment of Czech officials was already uncontroversied and looked upon as a matter of course. Finally the old wish was put forward for a separation of nationalities in the education of the young inhabitants, which they feared would result in the Czech population being gradually assimilated to the German population and the German students in Prague, in order that neither of the two nationalities should oppress the other in the internal affairs of Bohemia.

These German demands, which were exactly analogous to those formerly put forward by the Czechs, so long as they were still in a minority, now roused violent opposition among the latter. They called attention to the fact that the Germans in earlier days were deaf to such requests; they saw in them a “dismemberment of the country,” and asserted that in the central public departments of Vienna, too, the Czechs did not occupy a number of official positions in proportion to their population, whereas the corresponding positions were wholly German population and the German students in Prague, where, on the very day of the imperial diamond jubilee, the Government had to proclaim a state of siege.

The Reichsrat, which reopened under such conditions in Nov. 1909, stood under the threat of a paralyzing Czech obstruction. This time the Poles came to the rescue of the Government in its hour of need, by getting a form of standing order approved which rendered obstruction somewhat more difficult, and in this, curiously enough, they were helped by the Czechs; for obstruction had brought about ever since an impasse, since their financial requirements had not been met. Thus the latter strengthening of the standing orders was carried through by an ad hoc combination of Poles, Czechs and Christian Socialists. But the freedom of parliamentary activity did not last for long. On Feb. 13 Bieniérth went part of the way to meet the German demands by introducing a bill dealing with the rearrangement of the administrative districts (Kreise) in Bohemia. According to the statistical returns there were 139 administrative sub-districts where only Czech was spoken and 95 speaking only German, as opposed to only five bilingual ones. These 239 sub-districts, according to the bill, were to be grouped in 86 in Kázy, six German and four bilingual, in which provision was to be made for minorities throughout the whole land through official translation bureaus. This bill was intended to be a solution of the language question, which should take into account the actual conditions of the population as well as practical needs. The excitement with which the Czechs opposed this measure was extraordinary. They brought about a scene in Parliament which ended in hand-to-hand fighting and assaults, whereupon the Government immediately closed the Parliament.

In other directions, too, Bieniérth’s period of government was filled with hostile nationalist proceedings. The Italian students desired to revive the question of an Italian university, which had come to a deadlock, and in Nov. 1908 set on foot a great demonstration at the university of Vienna, in which the usual fairly harmless fighting with sticks was replaced by revolver alarms. In spite of this, Bieniérth, with the consent of the Germans, introduced a bill in Jan. 1909 which was to set up an Italian faculty of laws provisionally in Vienna.

At this time the Czechs were trying to gain a foothold in frontier lands which had hitherto been considered solely German. They alleged as a reason that two small country communes of Lower Austria, Ober- and Unter-Thermenau, had a mixed colony of Czechs and Croats; it was further advanced on their side that a considerable annual migration to Vienna took place, which became Germanized in the second generation, and so acquired a larger Bohemian nationality. Vienna, with over 195,000 Czechs, was actually the second largest centre of Czechs in Austria, and a really still clearer diminution of the Czech population of Vienna was noticeable; according to the census of 1900, out of 1,674,000 inhabitants there were 102,970 Czechs, i.e. 6.1%; in 1910, out of 2,030,000 inhabitants, 98,400 Czechs, i.e. 4.8 per cent. The Czech colonies in Vienna endeavoured, by means of the so-called “Komensky schools” (from the Czech form of the name of Komensius, the educationalist), to protect themselves against fusion with the indigenous population. The Viennese Czechs saw in this a danger to the hitherto peaceful common life of the population of Vienna. On Sept. 3 1909 the Lower Austrian Diet, in opposition to the Government amendments, tried to establish German by law as the language of instruction in all the public schools of Lower Austria, in correspondence with the actual state of affairs hitherto. On Oct. 7 Burgomaster Luenger insisted that Vienna could only be an unilingual city, as otherwise she would have to speak nine languages; and on Jan. 18 1910 this resolution received the force of law. Analogous laws were promulgated in the three other purely German Crown lands.

After the Tobacco railway had been built for the Alpine countries—without, it is true, any particular pecuniary help from the Federal Government, to which the money was raised by the Austrian Government, as the Czechs had been paid for this work, and indeed they had become so passively interested—the Poles demanded a complete carrying into effect and extension of the waterways law, with a larger State subsidy. It was over these demands in connexion with the waterways, which the Minister of Finance declared to be impossible of fulfilment to the extent required by the Poles, that Bieniérth’s mainstay failed to support him; and on Dec. 12 he sent in his resignation, which was, however, followed by a renewed Bieniérth Ministry, composed of Germans, Poles and officials. By means of this coalition the Ministry succeeded, indeed, in passing the military service reforms on April 24 1911 (reduction of the three years’ service to two years, combined with an increase in the contingent of recruits); but this completely exhausted its parliamentary strength, and the first parliamentary suffrage Parliament ended with but poor results in the midst of unsolved national problems.

Since 1910 a meat shortage in Austria had made itself more and more felt, especially in the towns, owing to their rapid growth, the decrease of cattle-raising in the Alpine lands, and the reduction in the imports of Serbian meat through the anti-Serbian agrarian policy of Hungary. The Christian Socialist party, from being originally an urban party, which had become purely an urban and partly a peasant party, and the Minister of Commerce, Weisskircher, 2 who had come from its ranks, had

1 Baron Richard Bieniérth-Schmerling (1853-1919) was made Minister of the Interior in June 1906; Prime Minister Nov. 1908–June 1911; and till 1915 he was Statthalter for Lower Austria.

2 Richard Weisskircher (b. 1861 in Vienna) entered the municipal service in 1883 and became in 1903 president of the town council; 1905-11 Minister of Commerce; 1912–8 Burgomaster of Vienna; a deputy from 1896 onwards; and in 1907 president of the Chamber of Deputies. He was a disciple of Luenger, a Christian Socialist, and framed a new municipal statute and associations based on the Christian view of society.
only to reckon with the opposition of Hungary but also to pay particular attention to the peasant voters, in the question of buying meat abroad and importing frozen meat from the Argentine. On this account, especially after the death of Lueger (on March 10 1910), a dominating personality who had held all parties together, opinion in Vienna and other towns turned against the Christian Socialists, who were accused of refusing all active measures of relief. Thus it happened that the elections to the Reichsrat in July 1911 were characterized by a temporary coalition of the German Liberals with the Social Democrats against the Christian Socialist party; this led to heavy losses on the part of the latter, especially in the towns. In Vienna especially they lost every seat except that of Weisskirchner, in which the Chamber had found itself deprived of all parliamentary support. He resigned, and with him the head of the Cabinet; the ground had slipped from beneath his feet, and on June 19 1911 Bienert resigned for good.

Gautsch Ministry.—The Bienert Government was succeeded by that of Baron Gautsch. He too could attempt nothing more than to take up as objective an attitude as possible above parties. His first task was to try to set in motion again the negotiations for a German-Czech compromise in Bohemia. The Czechs, however, had realized that at need they could get along without a Diet; and they had every reason to be convinced that in the absence of his co-nationals the principle of State authority, which Gautsch claimed to be that of State authority, had recourse to severe measures of punishment and discipline, which had as their result a revolver attack on the Minister of Justice from the gallery of Parliament.

On Oct. 28 somewhat unexpectedly the prime minister resigned, partly because this series of unfortunate incidents had shaken the Emperor's confidence, partly because his secret efforts to persuade the Czechs to join his Cabinet had made him suspect to the other parties. But the Czechs not only demanded two Czech ministers, but also a number of headships of departments and annulling of each department's dismissals they had led to an introduction of the national divisions into the central administration, and if similar claims were put in by other nations the principle of a purely objective Government transcending nationality would have been done away with. So Gautsch would have nothing to do with it.

Stürgh Ministry.—Count Stürgh (b. 1859), the Minister of Education, was next entrusted with the formation of a Cabinet. He composed his Cabinet of colourless officials and confessed adherents of the various nationalities. His programme was to be an honourable mediator in the German-Bohemian quarrel, to extend the railway system, and to satisfy the wishes of the Poles in the waterways question by an expenditure of 73-4 million kronen on canal construction in Galicia, to which Galicia was to contribute only 9-4 million kronen, the State finding the other 64, and by an expenditure of 125 millions on river improvements, 99 of which would be contributed by the State.

Early in Stürgh's Ministry prominence was taken by the Catholic marriage question. While in Austria the marriage of non-Catholics could be dissolved, so as to make a new marriage possible, paragraph ii. of the civil code provided that "the tie of a valid marriage between Catholic persons can be dissolved only by the death of one of the parties." This shall be the case even when only one party was attached to the Catholic religion at the time of the conclusion of the marriage." Thus Catholic and mixed Catholic marriages were indis Solvable even in the event of a change of creed. The desire of a numerous divorced persons for a change in the law which prevented their remarriage was manifested in repeated demonstrations before Paul Gautsch especially in that of Dec. 1911, in which it was asserted that the lives of half a million divorced wives were affected. In spite of the reform of the civil law in other respects (June 1 1911) these provisions remained in force until the republic. Owing to the opposition of the Christian Socialist party, they were even then not abolished; but they were relaxed by numerous dispensations in individual cases.

It was while Stürgh was Austrian premier that the World War broke out (see under Foreign Policy, p. 327). At the beginning of hostilities too the war as a whole in Hungary, by the raising of the Austrian Empire was somewhat unexpectedly loyal to the state. The immediate cause of war—the murder of the heir to the throne—had profoundly impressed all the Austrian peoples, and the belief that efforts were being made from without to destroy the old empire produced among them a strong reaction in favour of its preservation. Enrolment in the army proceeded everywhere without friction, and much more expeditiously than the military authorities had expected. It was only to be expected that the Germans, whose very existence was in question, should show themselves to be patriotic. But it was somewhat surprising that even after Italy's declaration of war the majority of the Austrian Empire sang Die Wacht am Rhein together in the streets, and the burgomaster, a Czech, made a speech in German before the town hall in which he called for cheers for the Emperor William and the fraternization of Germans and Czechs. On Oct. 24 1914 the Czech Union solemnly declared: "It is true that we have been against one Government or another, but never against the state." On Nov. 13 the Czech parties in Moravia issued a patriotic manifesto. The procedure of the Poles was similar; all the Polish parties united in a joint central committee which issued a manifesto in favour of performing their duty to the state (Aug. 15). On Aug. 27 the Ruthenian Metropolitan, too, issued a protest against "Tsarism," and in like manner the Ukrainians protested (Nov. 1) against Russian oppression of freedom of conscience. On Nov. 23 30,000 Rumanian peasants of the Bukovina got up a great manifesto in favour of the emperor and the empire, and on Dec. 1 patriotic protestations from the Rumanian Club followed. These proclamations on the part of all the Slav peoples of Austria proved that imperial sentiment was more deeply rooted than Austria's enemies had believed.

These evidences of patriotism continued for a long time during the war; even after the declaration of war the majority of the Italian deputies in the S. Tirol issued a loyal declaration, "in the name of the overpowering majority of the population," as they asserted (June 14 1915). On the other hand the efforts made for years by Panslav idealists, Russophil agitators, Serbian propagandists and Italian irredentists, were naturally not without effect. Isolated instances of relations being established with co-nationalists in the enemy camp were recorded from the beginning. The question was repeatedly raised as to why the prime minister did not take advantage of this patriotic spirit to obtain a corresponding parliamentary demonstration; but it had surprised him, as it had many, and he shrank from the serious responsibility which would have resulted if the experiment had turned out badly; the aged Emperor's need of quiet, and the conviction that the Reichsrat, if summoned ad hoc, would, as for so long before, be of no active use, also played their part. The population had not been consulted as to the declaration of war, and their opinion was no more listened to now; but by giving up the cooperation of Parliament the prime minister at the same time abdicated his power in favour of the military authorities. Since there was no longer a Parliament, or any personal immunity, the military authorities established an unlimited police rule, which seemed to be obsessed with terror of its own citizens; anyone who seemed to them suspect was subjected to internment in concentration camps. This ruthlessness towards their own citizens, who were arraigned before military courts in trials for high treason, stood in curious contrast to the considerate treatment of "enemy aliens," who were comparatively little molested. For example, even many
AUSTRIAN EMPIRE 319

months after the beginning of the war advertisements were to be read in all the papers, in which English and French people offered to teach languages or instruct children even in English and French, stating their nationality and address—a proof that the authorities did not put any particular difficulties in the way of these foreigners, and that the people did not take advantage of knowing their addresses to molest them.

The political impotence of the prime minister was plainly evident in the military proceedings against Kramarz, in which Stürghk shook hands with the accused and gave evidence in his favour, but without being able to avert the death sentence passed by the military court, though he did at least prevent the execution of the sentence.

During the later part of the Stürghk Ministry it is no longer possible to speak of an internal policy, for the military alone ruled. Towards the end, however, Stürghk was actually endeavouring to bring about a reassembly of the Reichsrat, when he was shot by the Independent Socialist Dr. Friedrich Adler (Oct. 21 1916).

Körber Ministry.—The object of the murder of Stürghk, namely, to lead to a powerful demonstration in favour of the summoning of the Reichsrat, was not attained; at a meeting held between some deputies and members of the Upper House (Oct. 23 1916) no definite proposal to this effect was brought forward, and the Körber Ministry, which was summoned on Nov. 1, ruled during its eight weeks' period of activity without Parliament. On Nov. 14 Körber set up an office for food control (Volkswohlfädenverwaltung) which later became the Ministry of Food (Jan. 1917). Little else was done; the approaching death of Francis Joseph (Nov. 21) prevented any far-reaching plans. When the worn-out old Emperor was succeeded by an immature boy, the serious, positive and somewhat "schoolmasterish" Körber did not strike the right note with him. Charles I. could not forgive Körber for prevailing upon him to promise to take the oath to the constitution, since the constitution was no longer tenable and Stürghk had already prepared constitutional amendments; on the other hand Charles's assumption of the supreme command of the army was opposed to Körber's taste. When Körber declined to carry through the Ausgleich with Hungary without consulting Parliament, and made it a question of confidence the young Emperor on Dec. 20 1916 lightly dismissed his best adviser.

Clam-Martinitz Ministry.—Körber's successor, Clam-Martinitz,1 who belonged to the violently Czech feudal nobility, tried to form a national coalition Cabinet, including two German politicians. The political event of the moment was President Wilson's note (Dec. 11 1916) and the Entente's answer (Jan. 12 1917) as to the liberation of the "oppressed" peoples of Austria. It called forth sharp counter-manifestoes on the part of those who were to be "liberated." A resolution adopted unanimously on Jan. 17 1917 by the Croatian representatives proclaimed, as a condition of the national existence and the cultural and economic development of the Southern Slavs, that they should remain under the House of Habsburg. The Czech Union rejected, by a unanimous resolution of its governing committee, the suggestions of the Entente, as being insinuations based on erroneous premises, and deprecated by a reference to their secular allegiance "the interference of the Entente Powers" (Jan. 23 1917). Koroschek, the Slovene leader, wrote to the minister in the name of his party that "these hypocritical assurances have called forth nothing but indignation among the Southern Slavs" (Jan. 1 1917). The Rumanian Club made a similar declaration on Jan. 24.

The hope of achieving parliamentary cooperation on the basis of such loyal declarations as these soon vanished. The Germans demanded, as a condition precedent to the effective participation of their nationality in the affairs of the state, an alteration of the constitution by imperial ordinance (Obròto), which should define the boundaries between the nationalities in Bohemia, rearrange the districts (Kreise) accordingly, declare German to be the language in which the business of the Reichsrat was to be conducted, and lay down more stringent rules of procedure. The Slavs, on the other hand, demanded the "unconditional" summoning of Parliament. The Germans yielded, and the Reichsrat met on May 31. Both the Southern Slavs and Czechs immediately made constitutional declarations; the former demanded a national union of the Southern Slavs, the latter a territorial union of the lands S. of the Sudetic Mountains, while the Germans opposed any transformation of the monarchy into a federal state. In the face of this uncompromising display of opposition there could be no hope for the Coalition planned by Clam-Martinitz for the creation of a new Austria, and on June 19 he resigned.

Seidler Ministry.—On June 24 1917 the Emperor appointed as prime minister his former tutor, the Ritter von Seidler,2 who summoned a Ministry of mere officials, just to carry on business for the time being; any constitutional reorganization was still postponed. On July 2, on the occasion of the Crown Prince's birthday, the Emperor proclaimed a wide measure of amnesty, in which on July 10 even Kramarz and his confederates were included. This precipitate action aroused the mistrust of the Germans, and, in view of the ambiguous attitude of the prime minister towards the Czechs, led to a vote of censure being passed at a meeting of the German national council at Prague on July 15.

Seidler now resolved to undertake the reconstruction of the crumbling body politic, with a reorganized Cabinet (Aug. 31 1917). A great economic and social programme was announced, including the extension of waterways, the exploitation of electricity, an improved system of communication, industrial insurance, and a department for public health. Politically the organization of the state on the fundamental principle of national autonomy was to follow; he hoped to get round the nationalist obstacles in Bohemia by a rearrangement of districts with local delimitation according to nationality. This bold plan met with no success; the economic programme in particular did not come into force; it was an empty promise, which was not taken seriously. But the political programme, on the other hand, let loose a violent attack of the Slav nationalities on the state. The Polish committee, which had been formed on a political basis, was dissolved after unprecedented stormy negotiations, due to discontent at the cession of Chelm (Kholm) to the Ukraine; the Poles threatened the rest of Austria with a boycott of food, and abstained from voting on the budget. The action of the Czechs was even more dangerous to the state; on Jan. 12 1918 a meeting of their deputies at Prague unanimously accepted a resolution to the effect that the Bohemian question was to receive an international solution at the Peace Congress. Seidler regretfully pointed out in Parliament on Jan. 22 that this resolution was totally opposed to that of May 1917, which could still be reconciled with the fundamental conceptions of patriotism. The Germans rejoined with a demand for a province of their own, German Bohemia, separate from Czech Bohemia (Jan. 22). Similarly the Ruthenians demanded that East Galicia should be erected into a separate Crown land under the name of the Ukraine (March 3). Since the Northern and Southern Slavs had abstained themselves and the Poles were in opposition, the Reichsrat was adjourned (May 3), and the Germans now again demanded the grant of a revised constitution, with German as the language of State, a special status for Galicia and Dalmatia, access for the Germans to the Adriatic, and the partition of Bohemia. Seidler granted indeed a rearrangement of districts in Bohemia (seven Czech, four German and two mixed); but he could not make up his mind to go further, and tried the expedient of summoning a fresh Parliament on June 16. But the day before

1 Count Clam-Martinitz (b. 1865), an hereditary member of the House of Lords, and chairman of the Committee of Privileges in it, had been head of the Ministry of Agriculture from Oct. 31 1916; up to June 23 1917 he was Prime Minister, then Governor of Montenegro till 1918.

2 Ritter Ernst von Seidler (b. 1862 at Schwetz, near Vienna) was secretary to the Chamber of Commerce in the mountain town of Leoben; then an official in the Ministry of Agriculture, and from June 1 1917 Minister of Agriculture; he was also a university reader in constitutional law.
the Czechs had set up a national committee, with Kramarz at its head, which opposed the programme of "a Czechoslovak State, sovereign and independent." They proposed the impeachment of the minister responsible for the nomination of the chiefs of the districts, and declared that they would take no part in revising the constitution. His plans having thus been completely shipwrecked, Seidler resigned on July 22 1918.

Hussarek Ministry.—Hussarek, 1 who was appointed prime minister on July 24, declared his programme to be parliamentary government, with reconciliations of the nationalities, and constitutional and administrative reform. The Czechs, however, declared that, so far as they were concerned, nothing had been altered. Hussarek got through a 3 months’ provisional budget with the help of the Poles against the votes of the Ukrainians, a proof that he had shelved the partition of Galicia. Immediately afterwards the Reichsrat adjourned for the summer holidays (July 26), without having ventured on any steps towards the solution of the great problems of State.

The process of dissolution advanced rapidly, when England on Aug. 17 recognized the Czechoslovaks as an allied nation; to which the Austrian Government replied with the declaration that no such state existed, but only individual traitors. In a communication to the press on Sept. 4 Hussarek insisted that there was no opposition of peoples in Austria, that on the contrary her constitution assured to the several nationalities a status of equal rights like that of no other state on earth, and he gave a warning against its destruction—a vain appeal to reason. On Sept. 18 the Czech National Council had already imposed some taxes. On Oct. 1 Hussarek again gave the Reichsrat a chance; he recognized expressly the right of the peoples to free self-determination, adopted the standpoint of national autonomy, championed Polish independence, and announced the union of all the Southern Slavs of Austria by constitutional means. This programme met with a cool reception; the Poles by now were expecting a new organization from the Peace Congress; the Southern Slavs desired union with those of their race in Hungary also; the Czechs opposed the division of the administrative commission into two parts; they did not want autonomy for their nation, but incorporation of the German Bohemians in their State, and refused all negotiations.

The Emporior made a last despairing attempt; a manifesto of Oct. 16 proposed the conversion of Austria—not of Hungary. It is true—which into a federal state composed of free nations, each with the territory which it occupied. This was far from resulting in any cooperation of the nationalities in realizing their formal ideal; on the contrary, they felt themselves free from all constraint, and formed Governments having no connection with the old state. On Oct. 19 the Ukraine National Council was set up in Lemberg, and the Slavene-Croat in Agram; on Oct. 20 the Czechs followed suit in Prague, on the 21st the German delegates in Vienna, on the 25th the Magyars in Pest.

Lammash Ministry.—The summoning of the last Ministry of the Austrian Empire, under Lammash from Oct. 27—31 1918, could only be regarded as an attempt on the part of the impotent Monarch to bring about a friendly liquidation between the peoples who were separating from each other. But since the non-German nationalities were not prepared to accept such a peaceful settlement, the liquidation between the monarchy and the new republic was confined to German-Austria, and Lammash’s friendly offices might certainly be thanked for the fact that in this quarter the settlement was achieved quite bloodlessly, in favourable contrast with the two years of fighting between Czechs, Poles, Ruthenians, Magyars, Rumanians, Southern Slavs and Italians. Lammash and his ministers shared their official premises peacefully with the new secretaries of state of the Austrian Republic, and his last official act was to send out posters with an appeal for peace and quiet. (For the later history, see AUSTRIA, REPUBLIC OF.)

BIBLIOGRAPHY.—The Österreichische Politische Chronik, published by Neisell (Vienna 1910—8), contains among other things an account of the most important transactions of all the public bodies (Parliament, the Delegations, etc.); Neuer Gesetzgebung Östreichs nach den Reichstagnordnungen (Vienna); H. Kelsen, Reichsverwaltungsordnung (1907); Hauptprobleme der Staatsrechtshfte (1911); Verfassungsgehege (1910); R. ECONOMIC CONDITIONS

Pre-War Period.—During the years 1910—4, immediately preceding the World War, economic conditions in Austria showed no uniform tendency, for in many fields the signs pointed to a crisis, while in others developments seemed full of promise. These conditions were undoubtedly determined by the critical political situation from 1908 onward, which made it probable that, sooner or later, the Habsburg Monarchy would have to fight for its right to exist. It is true that nobody could have foreseen coming events; but things kept on occurring which counselled prudence, and threatened the economic situation from without. Added to this was the state saw itself compelled, in view of the political situation, to increase its expenditure on armaments; and since this expenditure grew at a rate with which the revenue could not keep pace, the Government had constantly to raise large sums by borrowing in the open market, and in 1912 had even to raise a big loan in America. All this, combined with the stringency of the international money-market, meant a heavy burden on Austrian national economy. Voices were not lacking which, in view of Austria’s relatively small share in foreign investments, ascribed the deterioration of the trade balance to the fact that the public bodies were living beyond their means. (For later literary works on economic conditions see Table.)

According to the census of 1910, out of 16 million persons following an occupation 8.5 millions were engaged in agriculture and forestry, 3.6 in industry, 1.6 in commerce and transport, 2.5 in the public services, liberal professions, etc. Agriculture is thus the basis of economic existence for the greater part of the population; and the favourable crop statistics for the last years preceding the war, and especially the record harvest of the year 1912, must have had a beneficial influence upon the economic situation. The production of the most important crops for the whole of Austria is shown in Table I.

We must consider, in this connection, that the prosperity of certain industries depends directly upon the results of the harvest. It was only in years when the harvest was most favourable that Austria-Hungary was able to provide for her own requirements in corn; for export purposes, the output of crops was insufficient, while wheat, and above all, of recent years, maize had to be imported. In Table II. is shown the excess of imports of grain over exports (+), or of exports over imports (−).

The very cheapening of many commodities in 1913, side by side with which went also a cheapening of many manufactured articles, was indicated as the sign of a decline in the power of consumption of the population. It may here be mentioned that according to the savings bank returns there was also a decline in the amount of deposits. The deposits and withdrawals were respectively, in thousands of kronen:

After the heavy withdrawals of 1912 the decline in deposits, together with a continuance of heavy withdrawals in 1913 is with good reason a sign of economic depression. The economic situation of Austria shared in this respect in the general development of world affairs, in which also, after a period of prosperity, a reaction set in in 1913. It is only surprising that in 1912 the reaction already showed itself more sharply in Austria. The year 1914 soon showed signs of a coming relaxation of the economic crisis; but this development was interrupted by the World War.

The War Period, 1914–18.—The outbreak of war meant the almost complete paralysis of industry in Austria. Only the very narrow range of goods manufactured in peace-time found buyers, and these were used exclusively for the equipment of those going to the front. The bulk of industry found itself faced with the impossibility of disposing of the goods previously manufactured, and acted in consequence as best suited the interests of the moment: there were general dismissals of workmen, and enterprises were restricted or suspended. Numerous industries were almost entirely dependent upon export trade (e.g. the glass and porcelain industry in Bohemia), but foreign relations were to a large extent broken off through the closing of trade-routes and the entry into the enemy camp of countries which had been important markets. Thus during the first weeks of the war there was very great unemployment in parts of the industrial regions, since the dismissals far exceeded the proportion of casualties in the army, while agriculture, which was already occupied with the harvest, suffered from a serious shortage of labour.

The Government had not prepared in advance any measures...
for setting industrial production going again in any way. Its first steps in war economy were confined to the sphere of finance and credit: the bourse was closed, and a moratorium announced. With regard to the latter, however, the requirements of industry were limited to a certain extent, in that the withdrawal of money from the banks was allowed, so far as it was necessary for paying wages and for the provision of working capital.

There was no revival of industry until the orders of the military authorities began to come in, which gave lucrative employment. In a short time, and without any pressure from the Government, but solely as a result of the favourable prices it offered, industrial conditions were completely transformed so as to meet the exigencies of the war. At first indeed, since the war was only expected to last a short time, there was little disposition to incur the heavy expenditure necessary in order to secure a share in the manufacture of war material; but as the war dragged on and within six months factories everywhere had been adapted to the supply of munitions and all the variety of other things required by the Government for the armies. Industry was thus in many ways compensated for the paralysis of trade with private buyers in the home market and for the closing of foreign markets, and it would have been able to continue quietly on the old lines but for the emergence of a new factor which fundamentally altered the conditions. This factor was the rupture of communications with foreign countries, due in the earlier stages of the war to the limitation, and at one time the prohibition, of exports by neutral countries, the passing over of some of these countries to the enemy, and lastly the blockade by the enemy Powers, which increased in efficiency and made it more and more difficult to import the most essential commodities, until in the end it was almost impossible to obtain from abroad anything, needed either for the soldiers or the civilians.

In this respect Austria found herself in the same position as the German Empire; in fact, her position was in many respects considerably worse; many richly productive territories were temporarily occupied by the enemy; and as Austria was far less well provided with raw materials than Germany she was less in a position to produce goods for exchange. In addition to this there was another quite exceptional source of difficulties which had the most serious consequences for Austria, namely her relation with Hungary, due to the peculiar constitutional structure of the Austro-Hungarian Monarchy. The Hungarian Government could claim the right to take independent economic measures for her own territory in war-time; a joint arrangement was only possible for the territories of the Dual Monarchy—which were united for tariff purposes—by agreements between the Austrian and Hungarian Governments; and since neither Government was exclusively concerned to carry out an adjustment of economic conditions in accordance with what was necessary for waging war and holding out with the supplies at their disposal, but each had also to champion the interests of one half of the monarchy against the other, the negotiations between the two Governments were often attended with the greatest difficulties, and constantly ended unsatisfactorily. Hungary, in accordance with her economic situation, had always the advantage in these negotiations, since she was incomparably richer than Austria in foodstuffs, and the latter was constantly thrown back upon Hungarian supplies; and this superiority on the part of Hungary became more and more definitely pronounced in proportion as the provision of the necessities of life for the army and civil population became a steadily-increasing anxiety.

The more complete the economic isolation of the monarchy the more the lack of raw materials made itself felt, both for the manufacture of indispensable war supplies and for the feeding of the civil population. To prevent the war being brought to a premature end by dearth of supplies, the Government took measures, modelled on those adopted in Germany, for ensuring that necessary goods should be supplied to the proper quarters—whether the army authorities, manufacturers of war material, or consumers—and at a moderate price.

The quantity of raw materials which Austria had been in the habit of importing from abroad, and the quantity stored in the country at the outbreak of the war, were comparatively very small. The Austrian and Hungarian ports were of little importance as ports of entry for raw materials, the goods stored there being mainly from the Levant. On the other hand, wool, cotton materials, etc., which came from overseas, were imported through German or Dutch ports, and were stored there, though often already in Austrian ownership. It was of the first necessity to assure the transport through Germany of these Austrian-owned goods, and an agreement with the German Government securing this was made. Agreements were also concluded by which a share of the goods owned by Germany was conceded to Austria.

It was next necessary to organize the purchase of goods in neutral countries. This was at first left wholly to private enterprise; but, as Austrian buyers not only competed with each other but also with buyers of other countries, this was bound to send up prices, while the interests of the State were subordinated to private gain. To meet this situation Germany set up central boards (Zentralen), and Austria followed suit, partly at the request of the German Government, which wished to avoid the competition of Austrian agents. Since the functions of these organizations were commercial, for which the regular Government officials were unsuited, they were established as commercial joint-stock companies under peculiar conditions adapting them to the service of the State. Any dividends earned by them above 5 or 6% on their capital were to go to the State (in the first place to the Minister for War, to be applied to war purposes). In Austria the Government did not subscribe any of the capital, but the central boards were subjected to State supervision and their power of fixing prices was in many ways limited. These boards were now given the monopoly of the right to import certain wares (sometimes private buyers were allowed to purchase, but only on condition of selling the goods imported to the board); they were also entrusted with the reception of the instalments of raw materials already mentioned as released from bond in Germany. The activity of the central boards as purchasers in neutral countries did not last long; it came quickly to an end in 1915, especially after Italy's entry into the war.

Fresh tasks were, however, soon imposed upon them. The virtual stoppage of all supplies of raw materials from abroad necessitated the strictest economy in the use of those available at home, and this led to an elaborate system of Government control. Since expert advice was absolutely essential to the efficient working of such control, the task of carrying out the regulations as to the distribution of materials, etc., was entrusted to central boards under the form of war associations (Kriegsverbände), or economic associations (Wirtschaftsverbände), each controlling certain materials. The associations, to which the manufacture of war was to be confined, were directed by elected committees; at the head of each was an expert appointed by the Government, which was represented on the board by a commissioner exercising the Government's right of supervision. In addition to regulating the distribution of raw materials these boards exercised other useful functions, such as discovering fresh sources of supply, improving methods of production, etc. They also acted as receiving centres for goods imported from neutral countries, allied states or occupied territories. In this way there arose central boards for wool, cotton, oil and fat, hides and leather, and various metals—to name only the more important materials.

The control exercised by these boards was limited in scope and touched only comparatively narrow classes. It was otherwise with the control of foodstuffs, which was all-embracing. The problem in Austria, as elsewhere, was to keep the prices of the necessaries of life at a level low enough to enable the people to live. The attempt to fix maximum prices broke down, owing to the temptations to secret dealing, and, as in England, the card system had to be introduced.

Early in 1915 an institution was established for regulating the traffic in grain during the war (Kriegsgesche-VerschV-Anstalt); it included as a rule only the maize board, established to control the distribution of the maize contributed by Hungary.
The new institution was registered as a trader and was to be conducted on commercial principles, its expenses being covered by its receipts, and the State only guaranteeing it against eventual loss in order to secure the credit of the company. The principle of balancing expenditure and receipts was, indeed, soon abandoned, the State making advances to the institution in order that bread-stuffs might be sold under cost price. This institution, in the form of a holding company, which officials and experts appointed by the Government took part, had complete control of all grain, flour, mills and bakeries. Its activities in fixing the price and quality of bread, etc., and in rationing, closely resembled those of the food controller in Great Britain (see Food Supply and Rationing).

This system of State control prevented industries which used grain as their raw material from buying in an open market, and in their case too it was found necessary to regulate supplies by means of an organization analogous to that of the economic associations already mentioned. In many cases these boards were established in connexion with the already existing trade associations (e.g. the Central Brewery Board in connexion with the Central Association of the Austrian Brewery Association), which set up their own distributing-stations and divided the raw material among producers according to a scale fixed by the Government, charging the producers a commission, in addition to the cost price, in order to cover costs. These boards also undertook other functions, such as introducing new methods of manufacture and supplying the workers in the beverage factories with beer. Sugar and alcohol were also placed under the control of central organizations, which took over the work of the old boards, in connexion with existing organizations but with a certain independence: for instance, the Sugar Kartel ceased to exist, while the Central Sugar Board continued. The latter also managed the export of sugar, in return for which certain wares were imported.

Of particular interest were the purchasing associations formed during the war. In the autumn of 1915 the Ministry of the Interior established the "Vom Ministerium des Innern legitimierte Einkaufsstelle m. C. H." (Purchasing station with limited liability licensed by the Ministry of the Interior), known as the "Miles," which was charged with the buying of goods in neutral countries. At first this organization acted as agent of the newly-established "Approvissement" departments; it was only later that it received the monopoly of the right to import certain articles, the Government at the same time placing at its disposal certain wares with which to pay for them. The prices fixed by the Miles for the sale of its wares were not at first interfered with; it was only later that its dividends were limited to 6%. It was then transformed into the "OZEG" (Oesterreichische Zentral-Einkaufsgesellschaft: Austrian Central Purchasing Company), which was the very type of an "autarkic company." In addition to the dividend 3% was allowed for commission, office expenses and risk. By agreement with the Ministry of the Interior, as soon as the reserve exceeded by 16% the working capital (which was partly in shares, partly in bank advances) the company was to sell food under cost price; and this actually happened.

The system of regulation by central boards was severely criticised for inexperience and even for corruption, and sometimes justly; but on the whole it was amply justified by the urgent necessities of the times and by its results. Many other measures had also to be resorted to in order to maintain the industry of the country. Briefly, the duty of maintaining industries was made obligatory, and in the last resort the military authorities were empowered to take them over, though this was not likely to happen as long as the high prices continued and the Government supplied raw materials. Tillage was also made compulsory, but this had little effect on production owing to the shortage of labour, draft animals, manures and agricultural implements, together with the oppressive restrictions caused by the fixing of maximum prices.

All these measures could not alter the fact that the national economy became less and less equal to the tasks imposed upon it by the war. So soon as State control was applied to any article it could be taken as a sign that the supplies would soon come to an end, or at any rate were very restricted; and thus it was impossible to prevent the equipment of the army from becoming gradually more inadequate, and the provision both of the army and of the population behind the lines with all kinds of necessaries from being altogether insufficient; only wholly unsatisfactory substitutes could be provided, and the available provisions could hardly be made to go round. When the war came to an end Austria was almost completely stripped of many important commodities.

No better picture can be obtained of its overwhelming economic impoverishment than by studying the figures which show the decline in the crop returns for Austria, and taking into account the fact that imports from Hungary and the territories under military occupation naturally fell far below the proportion of foodstuffs formerly imported. Table X. gives the returns of the principal crops for Lower Austria according to the statistics of the Ministry of Agriculture.

*Average.

In the other Crown lands the crops declined in the same proportion. The production of fodder also declined steadily, the number of cattle fell, and the army horses were insufficiently fed.

To these purely economic difficulties was added the growing opposition of the population to the measures of compulsory. This in part depended on national factors, which became more clearly visible as the situation of the Central Powers became more and more unfavourable, but it was in part due simply to the exhaustion due to economic need. Thus the spirit of the labouring classes became more and more inflamed, and at the beginning of 1918 the Government had the greatest difficulty in suppressing an anti-war agitation among the working classes, which assumed a threatening form. Movements were now unchained which were bound after the end of the war to leave their impress upon the political events and internal economy of the young Austrian republic (see Austria, Republic of).

Finance and Banking.—The third licence granted to the Austro-Hungarian Bank expired on Dec. 31, 1910, and thus at first extended provisionally, as it was impossible to reach a settlement about the controversy between Austria and Hungary regarding the continuance of common currency and banking arrangements. In Hungary a strong majority, which the Government could not afford to ignore, insisted on the formation of an independent Hungarian bank; on the other hand the advantages accruing to Hungary through the community of the financial and banking organization were quite obvious. There was an important divergence of opinion between Austria and Hungary concerning the constitution of the bank. Since the closing years of the 19th century the Austro-Hungarian Bank had pursued a policy which had in the main the object of making the Austrian krona a gold exchange standard. It was decided, however, by the Austrian financial authorities that the obligation of the Austro-Hungarian Bank to convert its notes into gold on demand should remain suspended. The new bank was authorized to issue its own notes, to which the term "krona" was applied, and which were allowed to circulate at par with government bonds. The issue of notes was limited at the rate of 3 mark on 2 kronen, and the amount of the bank's tax-free issue of notes was raised from 400 to 600 millions of kronen, and the conditions formerly attached to the issue of 10 and 20 kronen notes were slightly relaxed.
AUSTRIAN EMPIRE

A 4% bank-rate had been uninterruptedly in force from May 8 1908 to Oct. 23 1910. From Oct. 23 1910 to Feb. 3 1911 it was 5%; on Feb. 3 1911 to May 31 1911 it was reduced to 4%, and on Feb. 23 1911 to 3% and from Sept. 22 1911 to Oct. 25 1912 the bank-rate was again 4% on Oct. 25 1912 it was increased to 5% and on Nov. 16 1912 a rate of 6% came into force and so remained until Nov. 23 1916, when it was lowered to 3% falling on Jan. 20 1914 to 5%, on Feb. 3 1914 to 4½% and finally on March 12 1914 to 4%.

These changes in the bank-rate show that Austria passed through a financial crisis and credit difficulties in 1912-13. These difficulties were due to the circumstances of the war. The stringency of the money market and the crisis had their commencement as early as the spring of 1912. The Balkan War, which broke out in the autumn of 1912, did not occasion the crisis, but it made it more acute. The number of trade insolencies in Austria-Hungary had reached its height in 1912. The Vienna Creditors' Association, the representative organization of creditors in the capital, reported on its 11th fresh failures with liabilities of 45, 40 and 33 millions of krones respectively. In 1912 the value of fresh claims involved rose to 12 millions of krones; in 1913 it still amounted to 73 millions. One obvious sign of a crisis was the demand for loans against security from the Austro-Hungarian Bank, which was the result of the unfavourable position of investments on the bourse. In each of the five years, ending Dec. 31, from 1909 to 1913 the loans granted by the Austro-Hungarian Bank against securities amounted to 90, 149, 187, 355 and 311 millions of krones successively. The bank-note circulation rose in proportion. Notwithstanding the fact that the bank-note issue was increased by the tax-free issue note in 1911 from 400 to 680 millions of krones, in 1913 the bank was unable to avoid incurring tax payments for notes issued in excess of the amount allowed free of tax, a state of affairs which had no parallel in the bank's history. From Aug. 23 1913 to Jan. 23 1914 the bank return showed no tax-free reserve of notes.

On July 23 1914 the gold reserve of the Austro-Hungarian Bank amounted to 1,288 millions of krones, its silver to 261 millions. In its balance sheet were shown amounts of 760 millions of krones, and at the end of 1914, 1,288 millions of krones. It had loans on security outstanding to the amount of 186 millions, and the bank-notes in circulation amounted to 2,130 millions of krones.

The outbreak of the World War compelled the bank to raise its rate on July 27 1914 from 4 to 5½% on July 31 to 6%, and on Aug. 2 to 8%. The public rushed to the bank to obtain advances by pledging their securities. The Act was in its original form an imperial ordinance having the force of law. In this manner the bank was converted into an institution which could supply the Government, by fresh issues of notes, with loans to an unlimited extent. The legal forms under which this source of credit was insured were various, but the actual result was in every case the same. The bank-rate was reduced to 6% as early as Aug. 20 1914, and the granting of credit on depositing securities was facilitated by extending the limits of the securities accepted.

The note issue was as follows:

<table>

</tbody>
</table>

In proportion to the increase of the notes in circulation prices and wages rose, and the krones depreciated on the foreign exchanges. This depreciation was to oppose the rise of prices by the increase, of the krones, and in public attributed the rise of foreign rates to speculation. A Central Securities Board (Devisenzentrale) was set up on Feb. 24 1916, and regulations were issued on Dec. 19 1916 and June 18 1918, attaching a series of conditions to dealings in foreign money, bills and securities, which amounted actually to a monopolizing of all such operations by the Devisenzentrale. These measures had no success. The value of the American dollar, in terms of Austro-Hungarian paper krones with legally fixed value, varied in fact, as shown by the Swiss exchange market, as follows:

State Finances.—The revenue from taxation rose year by year, partly owing to the increased profits of industry, partly to fresh increases in taxation. From the year 1902 to the financial year 1914-5 the State revenues doubled, rising from 1,730 millions of krones to 3,530 millions of krones. But this increase in the revenue was not achieved by placing an extraordinary strain on the taxable capacity of the country. In the financial year 1913 the amount of estimated exacted revenues was 1,608 millions of krones. Of the total revenue of 2,162 millions of krones, 432 millions (20½%) came under the head of receipts from direct taxation, 905 millions (43%) under the head of receipts from indirect taxation and taxes on commerce, while 294 millions (14%) were the proceeds of State property and State institutions. Of the direct taxes the land tax produced 52 millions, the house taxes 127 millions, the taxes on industry 127 millions, and the income taxes 158 millions. Of the indirect taxes on consumption the spirit tax produced 95 millions, the beer duty 85 millions, and the sugar duty 175 millions. The State debt amounted to 3,530 millions, and with the issue of the war it was at first impossible to contemplate meeting the cost of the war by raising existing taxes or by imposing fresh taxation. The costs of the war were in the first place met by loans and the assistance of the note-issuing banks. In the second place the State, as the former austro-Hungarian state, came under the necessity of carrying the debt of the war by placing the State becoming the debtor of the Austro-Hungarian Bank, in so far as credit was concerned.

The debt of the Austrian State to the Austro-Hungarian Bank in direct loans was by the latter to the State amounted at the end of 1919 to 25,068 millions of krones. But besides this, the bank had also afforded credits to the State in other forms. In return for bonds produced in the case of the State they issued Treasury bills, and transferred the proceeds from them to the two finance departments. The total amount of such Treasury bills in circulation at the end of 1918 was roughly 7,400 millions of krones. The Post Office Savings Bank was also made a bear share of the financial needs of the State. Whenever a war loan was impending it accepted advances from the members of the Banking Consortium, which had to place the war loans, and as soon as the subscription was closed they were compensated for the underwriting. At the end of 1919 these advances still amounted to 2,605 millions of krones.

Foreign credit also was laid under contribution by the Austrian State. On Oct. 23 1914 the outstanding debts incurred abroad during the war were as follows:

- 2,666 millions of German Reichsmarks
- 47 ½ million Deutsch florins
- 206 million Danish kroner
- 70 ¼ million Swedish kroner
- 3 ½ million Hungarian forint
- 3 ½ million Bulgarian levas

The home money market was approached by the Government through the issue of war loans. The total number of such war loans reached 53 million in amount. They both were a great issue took place on Nov. 1 1914, and from that time onwards a fresh war loan was issued about every six months. In this way a State debt of 35,609 millions of krones was accumulated.

In Sept. 1915 advances in taxation were introduced in Austria, except a slight increase in the duty on beer; neither any new taxes created. Even the reform of taxation carried out in the autumn of 1915 (modification of the inheritance and donations duty and taxation on capital) as it was then intended, should not be regarded strictly as war taxes, as they had been planned a considerable time before the outbreak of the war and had only been delayed by the inability of Parliament to continue its work. It was not until 1916 that increases took place in every field of taxation. The price of tobacco and the tariff of the State railways were considerably increased, special war increases were introduced in the direct taxes, and in April 1916 an entirely new tax was imposed—the "war profits tax," the name of which was subsequently altered to "war tax." But all these taxes and increases of taxation were quite inadequate to meet the enormous expense of conducting the war. War finance was not able to dispense with the printing of notes.

Art and Literature, 1910-21

Art.—All the Austrian artists who had been most characteristic of the age of Francis Joseph died about the year 1890. Thereafter the art of Austria was built around the names of provincial towns. The keynote of their style might be described as Austrian imperial sentiment. This common quality was also true of the decadent period of this style, which reached its height in 1900; and even after the World War it still had its representatives. Notable in this class were, among architects, Karl König (1841-1915); among sculptors, Karl Kundemann (1858-1919) and Kasper Zumbusch (1850-1913) in Vienna, and Josef Myslbek (b. 1848) in Prague; among painters the Czech Brožík (1851-1899), the Pole Jan Matejko (1838-1893), and the Viennese portrait-painters L. Horowitz (1843-1917) and Heinrich von Angeli (b. 1840). Others, such as the painter Adalbert Hynais (b. 1854) of Prague, and the Viennese sculptor Eduard Hellmer (b. 1850), or the Viennese engraver Ferdinand Schmutzer (b. 1870), displayed symptoms of a transitional style, dominated by an international influence. Austrian artists now sought every kind of contact abroad; many studied and lived in Munich, Berlin and Paris. As examples may be cited the Czech painters Antonín Slavíček (1870-1909) and Max Svařinský (b. 1873), the Pole Jacek Malczewski (b. 1853), and the artists who in 1897 founded the Viennese Independents (Wiener Secession). Evidence of their success in bringing new life to a dead tradition was given by the painter Rudolf Alt (1812-1919), who in
AUSTRIAN EMPIRE

spite of his great age brought about a transformation, and the architect Otto Wagner (1841–1918), who, though his roots were set in the age of Francis Joseph, became the leader of the moderns in Vienna.

Side by side with these artists, who, in spite of their international features, devoted their talents to Austria, were others who split away from their native land and became completely identified with foreign art, for example: Alphonse Mucha (b. 1860), who became a French decorative artist; the painters Charles Schuff (b. 1870) and Emil Ortik (b. 1870); the sculptors Hugo Lederer (b. 1871) and Hans Metzner (1870–1910); and the architect Josef Olbrich (1867–1905), who have all more importance in the development of German art in general than of Austrian art.

Meanwhile there arose various national schools, which developed with energy their racial peculiarities. The young Poés, united in the society called the Zunku, endeavoured to depict Slav gaiety in a riot of gaudy colour (Chelmsin, Melofter, etc.); in like manner the Slovak Jozu Upka (b. 1862) exploited his native lands, his materials being peasant customs and the peasant's love of colour. Frantisek Bilek (b. 1872) mirrored in mighty contours the ardent faith of the Slav peoples, while Jan Stursa, endowed with equal power, refi-

ned it into an art of truly European quality. In contrast with these two Czech sculptors may be placed the highly gifted Southern Slav Mestrovic, who expressed in his art the refractory energy and wild fanaticism of his race. Among German-Austrian artists the originality of the Tirolese Albin Egger-Lienz (b. 1868) deserves special mention, for in it the Tirolese element plays an important part. In it the leading personality of his generation was Gustav Klimt (1862–1918); his very delicate decorative art, his subtle taste in colour, his inclination towards industrial art, make his painting so Viennese that it would hardly be comprehensible in other surroundings. A pendant to him is the architect Josef Hoffmann (b. 1869), who originated in the school of Otto Wagner, whose stiff principles he softened, however, by his richertaste (e.g. the Stoellet House in Brussels); the tendency towards decorative and industrial art which Klimt had revived in Vienna was turned into a systematic school by Hoffmann. In theatrical decoration, in domestic architecture, in all branches of the handicraft, Vienna became a leading centre of the moderns, the "Viennese Workshops" (Wiener Werkstatte) and the "Austrian Craft Guild" (Österreichische Werkbund) being the centre of their activity. A leading figure among the younger generation of artists, after the war, was Oskar Kokoschka (b. 1888).

(H. T.)

Literature and Drama.—Between 1910 and 1920 new tendencies and personalities came into the literary foreground in Austria, and moreover death made many gaps in the ranks of the leading representatives of the older traditions. In 1916 died Marie von Ebner-Eschenbach (see S.845*). Born in the same year as Francis Joseph (1836), she had continued her literary activity to the very end of her life. In 1915 she published the sketches entitled Sterle Welt, and from her literary remains appeared in 1916 Erinnerungen an Grillparzer und Bliitter aus einem seltsamen Tagebuch; prose satirical on Ibsen, Hauptmann and the modern school, for whom she had no sympathy. Her enthusiasm for Tolstoy was correspondingly great, and among her successors she marked out for special praise Enrica Handel Mazzetti, with whom she carried on a correspondence which was published under the title of Der Dichterinnen stiller Garten. In 1915 died the Strian dramatist Peter Weibsteufel (see 1917–1934). He too delighted in creation till the end of his life, and he was occupied in revising his collected works for an edition in 40 volumes.

Rückblicke auf den Schauspiel des Lebens: Abenddämmerung appeared posthumously in 1919; it deals with questions of time and eternity, religious, social and political problems, and the characters of eminent people, e.g. Schiller and Francis Joseph. His greatest successor as a dialect poet he held to be the Tirolese dramatist Karl Schönherr. During the decade several other notable writers died. Count Albrecht Wickenburg (1838–1912), husband of the poetess Almasy-Wickenburg, was a fine lyrical poet who made a masterly translation of Shelley's Prometheus. Freiherr Alfred von Benger (1853–1912), important as an essayist and playwright, founded the Deutsches Schauspielhaus at Hamburg, and ultimately became director of the Burgtheater. Max Burchard (1857–1912), a distinguished jurist, who was director of the Burgtheater for eight years, was a champion of Ibsen, Hauptmann, Schützler and Anzengruber, and patron of the greatest of the authors of the rising generation—Heinred Bleibtreu, Lotte Medelsky, Mittwoch und Kaiz; he was active as a critic, dramatist and story-teller, but the artistic merit of his work was unequal. In 1917 died Bertha von Suttner, author of the novel Die Waffen niedern, well known as a protagonist of the League of Peace, and winner of the Nobel prize. The Zionist Hugo Zuckermann (1881–1917), whose song, Driiben am Wiesenrand sitzen zwei Doller, was much sung at the beginning of the World War, fell in battle. Peter Altenberg (1859–1910) died at the age of 60; he was equally original in his life and his art, and his books, Wie ich es sehe, Was der Tag bringt, Sonntags- etc., have a highly personal touch.

In spite of these losses there was no lack of talent in Austrian literature, for many followed in the footsteps of their predecessors but most of them sought and found ways of their own. The creations of Ibsen, Zola, Maeterlinck, Dostoievsky, Tolstoy, Shaw and Strindberg had their influence on the younger genera-

tion. Modern and ultra-modern tendencies, the new romanticism, symbolism, occultism, expressionism, took the place of realism, naturalism and impressionism. The partisans of Stürner and Nietzsche, the Sturm und Drang school, lost all sense of reason and moderation. Far removed from these wandering fires, and yet receptive to the subtle innovations of Ibsen and Hauptmann, there developed the most powerful of contemporary German-Austrian writers, Karl Schönherr. Born in 1830 at Axams near Innsbruck, the son of a schoolmaster, he spent his life in Tirol, going to the university of Vienna, where he qualified as a doctor. In 1895 he first appealed to the public in his dialect poems, Innthaler Schoruss, and his sketches Althand Kreuztöpf. His drama, Judas von Tirol, was an unsuccessful attempt to represent the betrayer of Andreas Hofer on the stage. Die Bildschnitzer and Sonnenwende met with success both at the Volkstheater and the Burgtheater. In 1907 followed the tragicomedy Codex, and then, that of the old peasant Grutz, was splendidly played by Josef Kainz, and is a finely conceived type. The character was so convincing that the original of old Grutz was looked for in every walk of life and mistakenly supposed to be Francis Joseph, since he kept the impotent heir, Francis Ferdinand, waiting in vain for the throne. After a fairy play, Das Königreich, Schönherr composed his tragedy, Glaube und Heimat, a national-historical drama which gave a vivid picture of the Reformation and Counter-Reformation and the proscription of Protestants in the Alpine regions, and in spite of ultramontane agitation was played hundreds of times with the greatest success. In 1915 Schönherr completed his technically unique drama for three characters only, Der Weibstuhl; it was violently attacked by ecclesiastical fanatics, and its morality was defended by the poet in an indignant answer to the bishop of Munich. In the middle of the war Schönherr published the drama on the subject of Hofer which he had begun in 1900, Volk in Not, a German heroic poem, which represented so impartially the light and dark sides of the Tirol's struggle for freedom that the military censorship of Berlin and Vienna, on trilling pretext, for years prevented this masterpiece from being produced. Schönherr's remaining plays, that of the old peasant Kindertag, the tragedy of a childless peasant woman; the Kindertag, again for three characters only; and two pessimistic pictures of academic life, Narrentspiel des Lebens (1918) and Der Kampf; ein Drama geistiger Arbeiter (1920). Schönherr's stories, Caritas (1907) and Aus meinem Merkbluch (1911), are worthy to rank with his plays, and in their sober form, grim humour and tragic reticence bear the true impress of the Tirolese race.

Fundamentally different in method and art is the most notable Austrian dramatist next to Schönherr, Arthur Schnitzler.

* These figures indicate the volume and page number of the previous article.
AUSTRIAN EMPIRE

Schönherr in his substance and method everywhere proclaims himself of the Alps; Schnitzler always shows himself a citizen of the Viennese capital and a man of the world. Schönher is a moralist, Schnitzler a sceptic. Whether in jest or in earnest, both as a writer of short stories and verse drama, he is principally preoccupied with the love motive; Anatol, a set of dialogues representing the world of pleasure and inspired by an exuberant wit recalling Maupassant, was published in 1895 by his best youthful production, Liebeli, and by a series of plays which discuss in sophisticated dialectic the problems of love and marriage. In Litteratur der Bohéme and Contes oun Mizz he attacks with exuberance and wit the highest Austrian aristocracy. In the grotesque Der grüne Kokakos he shows an avenging doom ready to break forth boldly over the unconscious ancien régime from a low drinking-den, on the day of the storming of the Bastille. The world-wide form of Der Dinge Madame, he published during Napoleon’s stay at Schönbrunn; it is a picture of the times, in which he does not fail to include the episode of Napoleon kicking his hat. Professor Bernhardi is a satirical picture, drawn by a master hand, of Austrian university and parliamentary life; it was played hundreds of times in Berlin, but under the Habsburg Monarchy it was forbidden by the censor owing to its only too true reflection of insignificant ministers and party leaders; it was not till the republic that the ban was removed from this comedy. As a story-teller Schnitzler achieved uncommon success when most haplessly inspired (Lebemann, 1901; Masken und Wunder, 1912). His novel, Der Weg ins Freie (1908), has the Jewish question as its subject.

The Jewish problem was also treated, with far deeper penetration, by Schnitzler’s friend, Richard Beer-Hofmann, who had been silent since the appearance of his Graf von Charolais half a generation earlier, in his Biblical drama Jaksobs Traum, which both in its form and content is of lasting value. Another close friend of Schnitzler, Hugo von Hofmannsthal, the much-feted leader of the aesthetic school of lyrical poets, wrote the libretto for Richard Strauss’s Elektra, Der Rosenkavalier (1911), Joseph, Ariadne auf Naxos (1912), Die Frau ohne Schatten and so showed in the worldwide fame of the musician. He gave a new version of Alcestis and of the mediaeval play Everyman (Jedermann). Widely read in the literature of the world, he formulates his opinions in refined though sometimes over-elaborate prose: the earlier collections of shorter works were supplemented after the war by several volumes of Rodammer Nachträge. The former protagonist of this group, Hermann Bahr, suffered from an excess of enthusiasm. The theatrical success of his much-acted Concert (1909) was not repeated in the case of any of his later pieces. In his Erinnerung an Burchard (1913), Auflauf für Religion und Philosophie, Inventur, Expressionismus (1917), and The Dramaturgy of his Tagebücher aimed at being an index to all the vicissitudes in and art and life. He sprang from one extreme to another; once a follower of Marx, a free-thinker and an anarchist, after the World War he was for the moment preaching reaction in science and uncompromising Catholicism. Hans Müller (b. 1882) is a writer of verse drama whose downright methods hit the taste of the masses. His drama Könige (1915), which enjoyed the special patronage of the German emperor and dealt ostensibly with the feud between Louis of Bavaria and Frederick of Austria, but in reality with the rivalry of the Hohenzollerns and Habsburgs, was one of the most popular successes. He modelled himself on Sudermann in one piece, Der Schäffer, the hero of which is the self-confident inventor of a serum; a weaker effect was produced by his play Sterne, which explains Galileo’s retraction as due to timidity. On the other hand his Flammru (1920–1), which represents on the stage the life of the demi-monde, ran for months in the great theatres of Berlin and Vienna, in spite of all the objections of the critics.

Austrian achievements in lyrical poetry were no less noteworthy than in the drama. According to the testimony of the German Soergel, the young lyric poets of the time venerated above all others two poets, Dohm, the poet of will, and Rainer Maria Rilke (b. 1875), the poet of mood. They regard Rilke’s bewitching melodies, his delicacy of observation, his mystic ardour, his absorption in God, as the highest revelation of their kind. Rilke himself, in his autobiographically-coloured Aufzeichnungen des Maltes Luardis Brige (1910), thus defines his poetic mission: "Verses are not sensations, as people think—they are experienced. For the sake of a single verse one must see many towns, men and things, one must know the animals, one must feel how the birds fly and in what wise the little flowers open in the morning."

Regardless of Rilke, Stefan George, or Hofmannsthall, the singers of the older generation continued to write lyrics in the traditional form: for example, the Styrian pastor Ottokar Kernstock (b. 1878), canon of Varaždin, 1878, Out of the Zwergergürtellin, and with Rosegger, Strickerischer Waffensegel (1915), Schwerzülfellen aus dem Zwergergürtellin, Kriegsgedichte. In Tirol too there was an ecclesiastic, Brother William (Müller), who wrote patriotic songs during the World War. Arthur Bernhardi (b. 1866) and Franz Karl Ginzkey (b. 1871) also preserved their old skill. A new note was struck both in war and peace by Anton Wildgans (b. 1881), who put forth, in quick succession to his first work, Herbstfrühling (1909) and his self-revealing Sonette an Ead (1913), Infanterie, Mittag, and several dramas with a lyrical quality, Armut, Liebe, and Dies Ira, which led to his appointment as director of the Burgtheater.

The greatest talent among the younger poets was Franz Werfel (b. 1890), who in his version of the Trojan Women of Euripides (1917) vividly pictures the curse of war, and afterwards, like Albert Eulenberg (b. 1898), taught himself to be a violent opponent of militarism. But the most outspoken condemnation of the war party, military or civil, was pronounced by Karl Jeremias Kraus (b. 1874), editor of the review Die Focke, a very considerable satirist and an unshrinking adversary of social abuses in his books, Stütlichkeit und Criminalität (1906), Die chinesische Mauer (1910), Pro domo et mundo (1912), Kultur und Presse (1913). In 1910 he displayed, as in a mighty fresco, "the last days of humanity." (Die letzten Tage der Menschheit), a series of scenes arising during the World War, which, changing from place to place, mock the awful tragedy in the cities. The action misdeeds of army commanders and diplomats, the credulity of the masses, the barbarity of military justice, the brainlessness and heartlessness of those in high places. Exaggerated in some details, and on the whole over-severe to his native land, Die letzten Tage der Menschheit is none the less, in spite of all reservations, a conceivable literary achievement, a picture of the times having the value of a document.

Among the older generation of Austrian novelists we may mention Emilie Mataja (Emil Marriot, b. 1839) for descriptions of ecclesiastical and social life; Adam Müller-Guttenbrunn (b. 1852) for novels dealing with life in the Habsburg Empire; Friedrich Scherbarth (b. 1872), the successor of Pötzl and Chiavacci among Viennese humorists. Among the most remarkable artistically are Enrica Handel Mazzetti (b. 1871) and Rudolf Hans Bartsch (b. 1873). Baroness Handel, who had been given a strictly religious education by the “englsche Fräulein” at Sankt Pölten, gave in her principal works—Meinad Helmpergers denkwürdiger Jahr (1900), Jesse und Marie (1906), Die arme Margaret (1910), Stephana Schwärder (1913), Ein deutscher Held (1920)—propagandist stories in which free-thinkers, Protestants and blasphemers are led by their tragic experiences to become Catholics. The action takes place against the background of the first 18th century, sometimes at the time of the Counter-Reformation, and in Ein Deutscher Held in the days of the Archduke Charles. Capacity for drawing convincing historical pictures here goes hand-in-hand with the gift of dramatic intensity. Her Catholic ideas do not make the author unjust to heretics, but she has a fatal taste for spiritual and physical torture, and wallows in scenes of blood and torment. Bartsch, originally an officer, won his first success with Zwolf aus der Steiermark, which was followed by many others, the greatest of which was Schwammerl, a novel about Franz Schubert. More closely knit in his technique is Jakob Wassermann, born at Fürth in 1873, a precise in form and a virtuoso in language; and richer in ideas is Erwin Guido Kolbenheyer (b. 1858), notably in his novel about Spinoza and Paracelsus.
Up to the end of the World War the Vienna Burgtheater had still the ambition of ranking with the Comédie Française as the first theatre of the continent of Europe. The dialect drama, to which Raimund, Nestrey and Angerszuber had contributed, still had the reputation of being, as Platen said, a popular form of comedy which is more comic than the whole of the German theatre. In the meantime the Burgtheater lost its brilliant Louis Bernhard Baumeister (1828-1917), and its greatest master of declaration, the famous emotional actor, Josef Kainz (1858-1918). Finally Alexander Girardi (1859-1918) died too, the popular Viennese comedian, whose gift for music and improvisation showed him no unworthy representative of the Italian tradition.

See Albert Soergel, Dichtung und Dichter der Zeit (1916); Oscar F. Walzel, Die deutsche Dichtung seit Goethes Tod (1919); Alfred Maderno, Die deutsch-österreichische Dichtung der Gegenwart (1920).

AUSTRIAN EMPIRE

History.—During 1910-20 the influence of the work of Theodor von Sickel (1826-1908), and of the Austrian Institute for Historical Research, which had been brought by him to a high pitch of excellence, was shown in a marked way in the writings of Austrian historical writers. In the footsteps of Sickel, and also of his great contemporary Julius von Ficker (1826-1902), came their disciples Engelbert Mühlbacher (1853-1904) and Emil von Ottenthal (b. 1855); Oswald Redlich (b. 1858), with his Rudolf von Habsburg; Alfred Dopsch (b. 1868), with his Wirtschaftliche Entwicklung der Karolingzeit (2 vols., 1912-13) and Wirtschaftliche und soziale Grundlagen der europäischen Kulturentwicklung (2 vols., 1918-19); Ludo Moritz Hartmann (b. 1865) with his Geschichte Italiens, etc.

A number of the historians who came from the school of Sickel turned to modern history under the influence of Ottokar Lorenz (1832-1903). Distinguished among them by his gift for vivid exposition was Heinrich Friedjung (1831-1920), notable for his Der Kampf um die Vorherrschaft in Deutschland (2 vols., 11th ed., 1910), Oesterreich, 1848-1860 (2 vols., 4th ed. uncompleted), Das Zeitalter des Imperialismus, 1832-1914 (vol. I, 1910), Gesammelte Aufsätze (1910). A rich literary activity was displayed by August Fournier (1852-1920), whose biography of Napoleon (3rd ed., 1913, Eng. trans. 2nd ed. 1914) became widely known even beyond the sphere of the German-speaking public. From the pen of A. Fournier, appeared, among others, the second volume of Die englisch-oesterreichischen Staatsverträge (1913), and Die geheimen politischen Staatsverträge Oesterreich-Ungarns 1879-1914 (1920; English trans. by A.C. Coolidge, 1920).

Worthy of note among the younger historians trained at the Institute were Hans Uebersberger (b. 1877), with Russlands Orientpolitik in den letzten Jahrhunderten (vol. I, 1913); H. R. von Strib (b. 1878), with Wallenstein's Ende (1920); Wilhelm Bauer (b. 1877), with Die öffentliche Meinung auf historischer Grundlage (1917); Viktor Bibl (b. 1870), with Der Tod des Don Carlos (1910); H. Kretzschmayer (b. 1870), with his Geschichte Ungarns (2 vols., 1909). The methodical research into texts inaugurated in Austria by Sickel and Ficker produced valuable fruits in the sphere of German and Austrian legal and constitutional history. Prominent among the workers in this field were Arnold Luschin von Ebengreuth (b. 1841); H. von Voldettis (b. 1862) and Siegmund Adler (1813-1920).

Among historians unconnected with the above-mentioned movement, Josef Freiherr von Helfert (1820-1910) was distinguished by a rare devotion to work; a man of great talents, he crowned his second, by History in two volumes of the Austrian Revolution of 1848. Ludwig von Pastor (b. 1854) continued his widely read Geschichte der Päpste (5th vol., 1920); Eugen Guglia (1855-1918) published a book on Maria Theresa (2 vols., 1917). In the sphere of Slavonic history the unfinished Geschichte Serbiens of J. Jirecek (1857-1918) is also worthy of note. As an economic historian Karl Grünberg (b. 1891) established his reputation during the decade.

The eminent Viennese professor of constitutional law, Josef Redlich (b. 1869), widely known abroad through his masterly works on English local government and English parliamentary procedure, published in 1920 the first volume of Das oesterreichische Staats- und Reichsproblem, a history of the internal policy of the Habsburg Monarchy from 1848 to the break-up of the empire. This first volume brings the account down to 1861.

(A. F. Fr.)

FOREIGN POLICY, 1909-18

Austro-Hungarian foreign policy in the crucial decade which, through the World War, led to the downfall of the empire, can now be understood by recalling the main historical problem that confronted the old monarchy.

Since the foundation of the German Empire and the kingdom of united Italy an extension of Austria-Hungary towards the S. and W. of Europe had become impossible. Only in the S.E. could she still count on an expansion of her territory and power. Thus from the seventies of the 19th century onwards the policy of the leading Austro-Hungarian statesmen had taken the direction indicated by geographical conditions. In this Austria had to reckon with the opposition of Russia, which, with the pressing back of Turkish supremacy, had become her great rival in S.E. Europe. In order to maintain herself as a Great Power, make her frontier secure against hostile attacks, and suffer no restriction on her further development, she could not allow another Great Power to command the Danube and its mouths, and arrogate to itself the hegemony of the Balkan peoples. This political and economic opposition between the Habsburg Monarchy and Russia was reinforced by opposition of an ethical and cultural nature. In view of this struggle against a competitor far superior in population and military strength, Austrian statesmen had sought an alliance or understanding with those European states whose interests appeared to run parallel with their own. It was to the benevolent attitude of Germany and England that Austria had owed the occupation of Bosnia and Herzegovina and the right of maintaining garrisons in the Sanjak of Novibazar—the door to the Near East and the first step towards an expansion of Austria-Hungary's sphere of influence in the Balkans, which promised rich prospects, but at the same time an increase in Russian hostility.

From the early eighties of the 19th century Andrássy's successors did indeed try to arrive at a modus vivendi with Russia. They were leisurely studying this in this effort by Prince Bismarck, who wished to hold the balance between his two allies. Numerous crises were successfully overcome, but the conflict of interest remained, and was especially heightened after the Russo-Japanese War (1904-5) had ended unfavourably for Russia. Russian statesmen denounced the policy, which they had followed for a time, of getting to the "warm ocean" in the Far East, and returned to the one which had been followed by Peter the Great and Catherine and never entirely given up, the goal of which had been the conquest of Constantinople and the command of the Bosphor. The constantly increasing differences between Germany and the Western Powers and the advances made by the latter towards friendship with the court of the Tsar, led in 1907-8 to a close entente between Russia and England, and hence to the development of the long-standing alliance between Russia and France into a Triple Entente.

Baron Aehrenthal, who from the autumn of 1906 had directed the foreign policy of the Habsburg Monarchy, recognized the threatening danger, which became greater and greater as the internal affairs of the Turkish Empire assumed a more and more critical aspect. This was more especially so when in the event of its final liquidation he was firmly determined to safeguard the interests of Austria-Hungary. It was above all necessary to make sure of the possession of the occupied prov-

1 The article under EUROPE, written from a British historian's point of view, should be read for a somewhat different perspective of the European situation which resulted in the World War. See also SERBIA. The account given here naturally reflects, in various aspects, the point of view of an Austrian historian.—(Ed. E. B.)
inches of Bosnia and Herzegovina, which had been under Austro-Hungarian government for 30 years past. The Young Turk Revolution, in July 1908, served as a pretext for carrying into effect the annexation of these territories, which had been planned long since. It happened opportunely that at this very time Russian statesmen wished to effect the realization of their designs on the Dardanelles. Isovsky, who directed Russian foreign policy, knew indeed that it would not be easy to win over Great Britain to his plan. But since he believed himself sure of Russian support, he hoped to achieve at least his immediate aim, the opening of the straits to Russian ships-of-war, so soon as he had come to an understanding with the Central Powers, and especially with Austria-Hungary. During the negotiations entered upon, on Aehrenthal's initiative, between the Cabinets of Vienna and St. Petersburg, Isovsky expressed his consent to the annexation of Bosnia and Herzegovina in the event of the Vienna Government's falling in with his plans as to the straits question. Aehrenthal seized upon this proposal, for he hoped that the annexation of these provinces would enable him to take active moves in face of the Greater Serbia movement.

At the beginning of July 1908 Isovsky handed in at Vienna a memorandum which guaranteed to the Habsburg Monarchy, besides Bosnia and Herzegovina, the greater part of the Sanjak of Novibazar as well. Aehrenthal accepted Isovsky's offer in so far as it applied to the annexation of Bosnia and Herzegovina; but he demanded the same right for the warships of Rumania and Bulgaria as for those of Russia, and in addition a guarantee against an attack on Constantinople by a Russian fleet entering the Bosporus. In return he was ready to give up the Sanjak and the rights appertaining to Austria-Hungary in Montenegro, and to accept the plan of an advance on Salonika, the seizure of which Andrassy had had in view as the next objective in Austria-Hungary's policy of expansion in S.E. Europe. On Sept. 15 Aehrenthal met Isovsky at the château of Buchtal in Moravia, informed him of the impending Austrian annexation of Bosnia and Herzegovina, and promised him in return a free hand in his proceedings with regard to the question of the Dardanelles. The two ministers promised each other mutual support; Aehrenthal renounced the Sanjak of Novibazar, as a set-off for which Isovsky gave a promise that Russia would not take possession of Constantinople. A European conference was given its sanction to their settlement. A binding written agreement was contemplated, but was not arrived at on this occasion.

When, however, at the beginning of Oct. 1908 Francis Joseph publicly announced the annexation of Bosnia and Herzegovina as a fait accompli, a storm of indignation burst forth in many quarters. It was insisted, especially in England, that agreements, settled by international treaties could only be modified with the agreement of all the contracting Powers. Both in Paris and in London, where Isovsky had betaken himself in order to obtain the consent of the Western Powers to the measures which he had concerted with Aehrenthal, he met with a decided refusal. Disappointed in his expectations, he now declared that he had been led astray by Aehrenthal.

Serbia lodged a protest against the annexation of Bosnia and Herzegovina, demanded autonomy for these territories under the guarantee of the Great Powers, and a port on the Adriatic for Serbia, with a strip of territory to connect it with Serbia. Since Austria-Hungary showed no inclination to take these demands into consideration, Serbia now began to strengthen her military forces. At the same time a violent anti-Austrian movement began to make itself felt. Protests were coming from Austria-Hungary were boycotted, and Austro-Hungarian traders living in Turkey were subjected to annoyance. Bulgaria, whose prince, Ferdinand of Coburg, had assumed the royal crown on Oct. 5 1908, also took sides against Austria-Hungary. Aehrenthal had made himself personally offensive to that country, which now entered into negotiations with Russia and Serbia. In Italy, too, a hostile tendency towards Austria gained the upper hand. Victor Emanuel III. described the annexation of Bosnia and Herzegovina as a stab at the Treaty of Berlin, and Tittoni, who had spoken on Oct. 7 in terms favourable to the annexation, declared in his great speech in the Consulta at the beginning of Dec. 1908—in contradiction with the tenor of a letter which he had addressed to Aehrenthal on Oct. 4—that he had entered into no engagements with regard to it. The nationalist press and the irredentists fanned the flames, and in the Austrian Parliament the Slavs, and above all the Czech leaders, raised loud complaints.

But Aehrenthal remained firm. He was convinced that Russia, which had had the better of the Russo-Japanese War, was not likely to draw the sword, and that he would therefore succeed in achieving his ends without bloodshed. His own efforts were directed towards the preservation of peace. In this point of view he was at odds with a powerful party, led by Conrad von Hotzendorff, chief of the Austro-Hungarian general staff, which was in favour of a decision by force of arms. In order to meet Russia's views Aehrenthal expressed his consent to the convening of a European conference, but insisted at the same time that he could only promise Serbia and Montenegro economic compensations, and made it a condition that the question of Austria-Hungary's sovereignty over Bosnia and Herzegovina should not be discussed at the conference, but only taken cognizance of by it. Aehrenthal's attitude aroused violent indignation in London and Paris. But since Germany resolutely took its stand on the side of the Habsburg Monarchy, France, with an eye to her Moroccan interests, only gave a lukewarm support to the Russian demands; and Isovsky found himself compelled to beat a retreat. As early as Dec. 1908 he agreed that the conference should recognize the annexation of Bosnia and Herzegovina after a previous discussion of the matter had taken place between the several Cabinets. Meanwhile Sir Edward Grey, the English Secretary of State for Foreign Affairs, advised the Turkish Government to give their consent to the annexation of Bosnia and Herzegovina to be bought by a proportionate cash indemnity. Aehrenthal fell in with a suggestion in these terms, and on Feb. 26 1909 concluded an agreement with Turkey which secured to the Sultan, in return for his recognition of the annexation of Bosnia and Herzegovina by Austria-Hungary, a considerable sum of money in compensation for Ottoman State property in the annexed provinces. In the course of the month of March the negotiations as to the annexation of Serbia were brought to a conclusion. It was to be effected by official declarations on their part, a European conference being avoided. On March 24 declarations in this sense were handed in at Berlin and Vienna by the Russian Government; those of England followed on March 28.

The danger of an Austro-Serbian war, which for some time had appeared inevitable, had fortunately passed by. Even after the settlement of the Austro-Turkish conflict the Serbs remained stubborn; Aehrenthal, however, wanted to avoid war, and now, as before, hoped to reach his goal by calm firmness and conciliation. At the beginning of March 1909 he declared that Serbia, in order to avoid the humiliation of having her fate settled by the statesmen of Vienna, might submit to the decision of the Great Powers. But the Serbian Government declined, and continued to arm. The Cabinet of Vienna then decreed that the troops in the S.E. of the Monarchy should be reiniorned. Isovsky now saw that Francis Joseph was in earnest. Since he could not venture on war, he accepted the proposal of the German Imperial Chancellor, Bülow, that Russia herself should use her influence over Serbia in the direction of moderation. On Great Britain's initiative negotiations were entered upon with the Government of Vienna, which led to the drafting of a note which should secure to Austria-Hungary the satisfaction which she demanded.

After overcoming great difficulties it was possible to effect an agreement. On March 31 the Serbian Government handed in a note at Vienna in which it declared that Serbia had not suffered any injury to her rights through the annexation of Bosnia and Herzegovina by Austria-Hungary, and promised to change the attitude which she had hitherto taken towards the Habsburg Monarchy, to maintain
good neighbourly relations with the monarchy, and to reduce her army to the footing of the previous year (1908). In so doing Serbia submitted to the behest of the signatory Powers, but at the same time to the will of Austria-Hungary. Montenegro thereupon followed suit. The event was a victory for Aehrenthal, but a pyrrhic victory, in that through it was effected the cleavage of Europe into two hostile camps. Russia now broke definitely with Austria-Hungary and became increasingly favorable to the German policy, with more success. He was at last persuaded to relinquish with increasing clearness the significance of the Southern Slavs in the struggle against Ger-

Aehrenthal succeeded by Berchtold.

Austro-Hungarian foreign minister was Count Leopold Berchtold, who had formerly been ambassador at St. Petersburg.

The Italo-Turkish War, and especially the closing of the Dardanelles at the instance of the Turks, had done severe harm to Russian trade, and increased the desire of Russian statesmen to gain command of the Black Sea. It was widely held, too, that this was a favourable opportunity to form a Balkan alliance under Russian leadership, which should make it possible for Russia, as protector of the Slav peoples of the Balkans, to take possession of Constantinople. Hargtwitz, the Russian minister in Belgrade, was particularly active in this direction. Other circles, led by Charykov, the Russian ambassador in Constantinople, thought it possible to attain the same end by other means. They wanted to preserve Turkey, but to make her Russia's vassal. She was to be admitted to the Balkan alliance and, in return, to allow the Russian fleet a free exit to the Mediterranean. But Charykov's efforts failed. Turkey refused; and in March 1912 Charykov had to leave Constantinople. The old plan of forming a Balkan alliance against Turkey was now taken up again. The greatest difficulty in its way was the jealousy between the Bulgarians, on the one hand, and the Serbs and Greeks on the other. Bulgaria would not hear of conceding to these peoples the extensions of territory which they claimed in Macedonia. It was not till March 1912, when the Russophil Guacheff-Daneff Cabinet came into power in Sofia, that the Serbo-Bulgarian treaty was concluded, which was indeed aimed in the first place against Turkey, but also had the Habsburg Monarchy in view. Two military conventions (of May 22 and July 17 1912) further developed this Serbo-Bulgarian alliance. Bulgaria now undertook, in case of war, to occupy the Sanjak of Novi-Bazar, to contribute 250,000 men towards a war with this Power. On May 29 Ferdinand of Bulgaria concluded a treaty with Greece against Turkey. But at the same time he handed in peaceful declarations at Vienna, Berlin and Constantinople, and let himself be feted in Vienna as a friend of the Habsburg Monarchy.

At the beginning of July 1912 the Tsar Nicholas II., at his meeting with the German Emperor at Balsiki Port (Port Balcic), in Estonia, laid stress upon his peace policy. But as early as Aug. there began the long-prepared conflict of the Christian peoples of the Balkans with Turkey, leading to bloody local struggles, in which there was no lack of atrocities on either side. In vain did the Central Powers endeavour to bring about an intervention of the Great Powers of Europe. On Sept. 30 1912 the order for mobilization was issued in Sofia, Belgrade and Athens. In order to have her hands free in this direction, Turkey thereupon determined to bring to an end the war against Italy by sacrificing Tripoli and Cyrenaica, and on Oct. 18 1912 the treaty of peace was signed at Lausanne. In the meantime the Balkan States had completed the last preparations for war. On Oct. 8 the Montenegrin declared war on Turkey, and soon after, on Oct. 17 and 18, Serbia, Bulgaria and Greece did likewise. To the astonishment of the European Great Powers they gained decisive victories over their opponent from the outset. The battle of Kirk Kilisse (Oct. 22) went in favour of the Bulgars, that of Kumanovo (Oct. 26) in favour of the Serbs. The Turkish troops, falling back rapidly, did indeed defend themselves successfully on the Chatalja lines against the oncoming Bulgarians, and thereby saved their threatened capital. But since none of the Great Powers would take active measures in their favour, they could not hope to recover the lost provinces. On Dec. 14 1912 an armistice was concluded between Turkey and Serbia, and between Turkey and Bulgaria. Greece took no part in it, but continued the struggle. The success of the Balkan States against Turkey meant a marked weakening of the prestige of Austria-Hungary in the Balkans. The entry of the Greeks into Salonika (Nov. 8 1912) and the advance of the Serbian troops to the Adriatic produced a particularly painful impression in Vienna. But consideration for the Slav peoples of the monarchy, who hailed with joy the victory of the Christian states of the Balkans over Turkey, and the dread of
inciting the open enmity of Russia by an energetic intervention
on behalf of the Sultan, held the Vienna Government back and
disposed it, as early as the end of Oct. 1912, to modify its
demands. Albania was to be allowed to develop freely; Serbian
aspirations towards the Adriatic were to be rejected, and
Rumania's claims to an extension of territory to be considered.
Bercichold demanded no more than security for Austro-Hungarian
economic interests in the Balkans. On this account he refused in
the most decided terms to consent to the proposal of the French
Government that Austria-Hungary, like all the other Great
Powers, should express her déclaration de flanc in the events taking
place in the Balkan peninsula.

In so far as his plans concerned Albania and Serbia, Bercichold
found Italy at first in favour of them, since they saw in the
spread of the Slav peoples to the Adriatic a danger to
Italy, to oppose which in good time seemed to them
more important than any further check to the in-
fluence of the Habsburg Monarchy, divided as this
was against itself. The common danger brought about a rap-
procheement between the two Cabinets, which was considerably
strengthend by Italy's annoyance at the attitude of France at
the time of the Libyan War. Thus it happened that as far back
as Dec. 1912, in spite of violent opposition on the part of the
nation, the Italian Government declared the more important section of the press,
and of Italian public opinion, in favour of the Tri
ciple Alliance was renewed once more for another six to twelve years, the period being
reckoned from 1914 onwards.

But the moderation displayed by Austria-Hungary in her
Balkan policy did not produce the effect which had been hoped
for at the Ballplatz. It weakened rather her credit
in the Balkans, disappointed the few partisans she had there, and encouraged the hopes of her many
opponents. Paying no attention to Bercichold's declarations,
the Serbs continued their efforts to extend their power to the
Adriatic. On Nov. 10 1912 Serbian troops reached Alessio.
At the same time Serbian politicians laboured to incite
the other Balkan peoples against Austria-Hungary, since it was
only at her expense they could hope to find compensation for
the concessions which they had made in the March treaty with
Bulgaria. In St. Petersburg, too, they left no stone unturned
create opinion against Austria-Hungary. And, in fact, in Nov.
1912 the Russian Cabinet declared itself in favour of the cession
of an Adriatic port to Serbia, and was supported in this by France
and England. The Russian trial mobilisation increased the dan-
ger of a bloody collision. The Vienna Government on its side
proceeded to prepare for war. The French, who had been
Hatzendorf was again entrusted with the position of chief of the
general staff, which he had had to give up a year before because he
had spoken in favour of an active military policy, showed
the V1st year had increased its influence at the Court of
Vienna.

But the disinclination of the three emperors to conjure up
a world war for the sake of Albania or Serbia, together with
the influence of Great Britain, proved stronger than the urgency
of the war parties either in Vienna or St. Petersburg. In opposition
to Austria-Hungary, Bethmann Hollweg, the German
minister, and Kiderlen-Wächter, the German foreign
minister, energetically upheld the point of view that a com-
promise with Russia was both desirable and possible. And in a
like sense William II, when the Archduke Francis Ferdinand
tried to convince him at Spinge (Nov. 23 1912) of the necessity
of an energetic course of action against the demands of the Serbs,
insisted that, while he was in favour of using firm language, he
was anxious to see all steps avoided which might lead to a rupture
with Russia. In order that no doubt should arise as to the policy
of the German Empire, Bethmann Hollweg, in announcing in the
German Reichstag (at the beginning of Dec. 1912) the successful
renewal of the Triple Alliance, add the remark that Germany
must leave it to her Austrian ally to realize her aspirations alone,
and would only join in a conflict in the case of a war of aggression
against her, for the preservation of her own position in Europe
and the defence of her own future and security.

Under the impression of these declarations Bercichold at the
end of 1912 rejected Conrad's propositions, which aimed at the
occupation of the Sanjak of Novibazar and riding
Albania of Serbia under Turkish sway, and he sought rather to
serve the interests of the monarchy by diplomacy.

In this connexion it stood him in good stead that a change had meanwhile
come over affairs at the Court of St. Petersberg, not
influenced by external factors, and especially by England. The
peace party had gained the upper hand. As late as Nov. 1912 the
Russian Government made a communication at Belgrade to the
effect that it would offer no active opposition to the formation of an
autonomous Albania, and requesting an attitude of reserve
Austria-Hungary on the part of the Serbian Cabinet.
Shortly afterwards, on the suggestion of Sir Edward Grey, a conference of ambassadors in London was decided upon,
to take place at the same time as the peace negotiations which
were being carried on there between Turkey and her opponents,
with a view to finding a solution of the outstanding questions at
issue between Russia and Austria-Hungary. After long hesitation
Bercichold, under pressure from Germany and Italy, con-
cluded the conference of ambassadors, but insisted that as a
matter of principle Austria-Hungary should take no part in any
discussion of the question as to whether Serbia should be per-
manently established on the Adriatic. Serbia thereupon declared her willingness to yield to the decision of the Great Powers.
Yet the Austro-Hungarian and Russian troops remained under
arms, and Serbian intrigues still went on. The negotiations of the
London conference of ambassadors proceeded slowly. When the peace
conference, which was sitting at the same time, came
temporarily to an end on Jan. 7 1913, owing to Turkey's refusal
of the demand of the Balkan States that she should cede the three
territories of Adrianople, Seutari and Janina, which had not yet
fallen, the conference of ambassadors presided over by Sir Ed-
ward Grey made efforts to prevent a resumption of hostilities;
but these attempts were unsuccessful. On Feb. 3 1913 began the
second Balkan War.

Meanwhile the deliberations dragged on in London as to the
frontier of the new Albanian state which was to be set up.
Russia in this matter presented the views of Serbia
and Montenegro, but met with resolute opposition
not only from the representatives of Austria-Hungary
but also from those of Italy. And it looked at last as
if it would come to an armed conflict between Austria-Hungary
and Russia. But at the last moment the danger was averted.
Prince Gottfried zu Hohenlohe was sent on a special mission to
St. Petersburg and succeeded in convincing Nicholas II. of
France Joseph's pacific intentions. The negotiations now
opened led in March to the cancelling of the mobilization on the
frontiers which had been set on foot by both Powers. At the same time the Russian representative at the London conference
of ambassadors announced his sovereign's readiness to consent
to the allotment of Scutari to Albania in the event of Austria-
Hungary's acceding to the separation of Diakova, Ipek (Peć)
and Prisren from Albania. On March 20 the representative
of Austria-Hungary handed in a declaration in the same sense.

By now the war between the Balkan States and Turkey had
taken its course, leading, in spite of the unexpectedly gallant
defence of the Turks, to the fall of Janina (March 12) and
Adrianople (March 26). On account of the wrangling which broke out between Bulgaria on the
one hand, and Serbia and Greece on the other, as to
the partition of Macedonia, on April 16 1913 Ferdinand of
Bulgaria concluded an armistice with Turkey. But there was no
sign of the peace which was desired on all sides. Serbia, in
defiance of the protests of the Vienna Cabinet, continued
to occupy Northern Albania with Durazzo, and Montenegro
continued to besiege Scutari, although the London conference of
ambassadors had assigned it to the Albanian state; and the
Great Powers decided on a naval demonstration against Mont-
enegro, which was not, however, intended seriously by all the
participants. The war party at Vienna, led by Conrad, wished to
force the Montenegrins to raise the siege, if necessary by arms,
but did not win their point. On April 23 Scutari fell into the hands of the Montenegrins. It was not till then that Berchtold served himself to the declaration that the Habsburg Monarchy would not tolerate such an insult, and made the necessary preparations for armed intervention. Montenegro thereupon submitted to the dictates of the Great Powers. The Montenegrin troops evacuated Scutari and on the next day the Serbs left Durazzo. At the end of May peace preliminaries were concluded between the Turks and their opponents. But it was impossible to arrive at an agreement between the victors as to the division of the territory which had fallen to them.

Notwithstanding the fact that it had had its way so far as Albania was concerned, the prestige of the Vienna Government in the Balkans had seriously diminished in the course of the two wars, not only in the eyes of the victorious peoples, whose self-confidence had mightily increased, but also in the eyes of its Balkan ally Rumania. King Charles had wanted to join in from the beginning of the first Balkan War, in order to prevent a hegemony of Bulgaria in the Balkans, and had only allowed himself to be persuaded to renew for the fifth time his alliance with the Powers of the Triple Alliance by an engagement from the Central Powers that they would see to it that Rumania received a corresponding extension of territory in the S.E. (Sisilistra and the surrounding territory was what they had in view). He now strongly pressed the Court of Vienna for the fulfilment of this engagement. Berchtold did in fact make every effort to decide the Bulgarian Government in favour of giving in the concessions to Rumania. But when his efforts broke down, those circles in Bucharest which favoured the Triple Entente (France, Russia, England) managed to make King Charles acquiesce in invoking Russia's mediation in order to acquire the desired increase of territory. But Russia's success at Sofia did not satisfy the Rumanians, and induced them to join hands with Ferdinand of Bulgaria's enemies. This was an advantage for Austria-Hungary, which was, however, set off by the increasing influence of the Entente Powers and their party in Rumania.

Austria-Hungary's leading statesmen met with no better success in their efforts to establish permanently friendly relations with Italy. San Giuliano's desire for common action with the Habsburg Monarchy in the Adriatic question had indeed led recently to a rapprochement between the two Cabinets. In the course of 1913 German statesmen had also succeeded in persuading Italy to further military commitments and to the conclusion of a naval convention, the object of which was defined as "the attainment of naval supremacy in the Mediterranean by the defeat of the enemy fleets" in a war against the Western Powers. But the voice of the Italian press and of nationalist circles, who demanded more and more insistently the dissolution of the Triple Alliance and union with the Triple Entente, did not leave the Central Powers any confidence in Italy's loyalty to her engagements. Meanwhile the third Balkan War had broken out. Serbia and Greece, joined by Rumania and Turkey, advanced against Bulgaria. The latter, left in the lurch by Russia and only supported diplomatically by Austria-Hungary, succumbed, and by the Peace of Bucharest (Aug. 10 1913) Bulgaria found herself compelled to enter into an agreement with her enemies by which she was a serious loser.

The outcome of these three wars meant for the Austro-Hungarian Monarchy a notable loss of prestige in the Balkan peninsula. Her adversaries in this quarter, Serbia and Montenegro, and especially the former, had achieved a considerable extension of their possessions, and henceforth, being no longer separated by the Sanjak of Novibazar, were in a position to join forces against the Habsburg Monarchy when the right moment came. The Bulgarians, however, disappointed in their hopes, ascribed the humiliating defeat which they had suffered in the third Balkan War to the fickle attitude of the Vienna Cabinet, which had indeed taken the first steps in the direction of active participation in the war in favour of Bulgaria, but had then, out of fear of Russia and under German and Italian pressure, contented itself with a fruitless diplomatic intervention. The fact that Berchtold's efforts to obtain a revision of the Peace of Bucharest in favour of Bulgaria met with no result could not contribute towards strengthening Austria-Hungary's credit at Sofia. On the other hand, the line of action of the Austrian envoy in Sofia, which in its own interest were working incessantly for a compromise between Bulgaria and Rumania, could be seen neither of these two Powers, led to a clearly perceptible estrangement between the Courts of Vienna and Bucharest, which enabled the Rumanian friends of the Triple Entente to win from the King his acquiescence in paving the way to better relations with the Western Powers and Russia. The only advantage which balanced these heavy losses of power and prestige for Austria-Hungary was the dissolution of the Balkan League, the revival of which was prevented by the inextinguishable hatred between Serbs and Bulgarians, a fact of all the greater importance for the Vienna Government as its relations with Serbia became more and more strained and the probability of an armed conflict increased.

The London conference of ambassadors had, on July 20 1913, come to an agreement as to a fundamental law for Albania, and at its final sitting on Aug. 11 had settled the southern frontier of Albania, long a subject of controversy. Serbia alone declined to give up the Albanian territories which she had already occupied in defiance of the London decrees, and persisted in her resistance when the Vienna Government pressed for their evacuation. The growing differences between the Triple Alliance and the Triple Entente meant that no united action could be expected from the European Great Powers. Italy and Germany—the latter more on grounds of prestige, the former because her interests in this case ran parallel with those of Austria-Hungary—associated themselves with the Vienna Government when, on Oct. 15 1913, it again insisted at Belgrade on the execution of the London decrees. Serbia at first again refused; but when Berchtold showed that he was in earnest and on Oct. 19 demanded at Belgrade, under threat of force, the evacuation of the Albanian territory occupied by Serbia, the Serbs submitted to the dictates of the Vienna Government (Oct. 29 1913) in accordance with advice from the Triple Entente. The Serbian press, however, continued to create prejudice against the policy of the Ballplatz, and the Serbian Government used every opportunity of encouraging movements which had as their object the winning over of the Southern Slavs living under the Government of the Habsburg Monarchy to the idea of a Greater Serbia.

In Rumania, too, the agitation against Austria-Hungary made headway every month. The agitation in Bucharest in favour of the Hungarian Rumanians became more and more active, and their liberation from the domination of the Magyars was indicated as a desirable and possible object of Rumanian policy. In order to achieve it a rapprochement was advocated between Rumania and Russia, and a suitable pretext was found in Nicholas II.'s very cordially expressed congratulations on King Charles's successes in the last Balkan War. It is true that the visit of the Rumanian heir to St. Petersburg (March 27 1914) did not bring about that open passing-over of Rumania into the camp of the Triple Entente which Russia had hoped for. King Charles could not be brought to this point, and the Rumanian Government, too, did not at that moment want to break definitely with the Central Powers. But the speeches accompanying the exchange of toasts at the meeting of Nicholas II. with Charles at Constantza on June 14 1914 left no possible doubt that the friends of the Triple Entente had gained the upper hand at Bucharest. As early as this, Count Ottokar Czernin, the representative of Austria-Hungary at Bucharest, expressed the decided opinion that, in the event of a war between the Central Powers and the Triple Entente, King Charles would not fulfil his pledges. At the same time he uttered a warning against underestimating the danger of an encirclement of the Dual Monarchy through the formation of a new Balkan League under the patronage of Russia and France.
To hinder this encirclement now became the principal endeavour of Viennese statesmen, who were untrifling at work trying to compose the outstanding differences between Bulgaria on the one hand and Turkey and Rumania on the other, and if possible also to win over Greece to a closer adhesion to the Central Powers. But all their efforts broke down owing to the divergent interests and the mutual distrust of the Balkan States, which came clearly to view during the negotiations conducted under the mediation of the Central Powers during the winter of 1913–14. The Turko-Bulgarian Treaty, which was nearly concluded in May 1914, did not come to anything; still less did the compromise between Rumania and Bulgaria, which had been furthered with such expensive efforts by Emperors Francis Joseph of Austria-Hungary and Nicholas of Russia. Greece with the Triple Alliance, desired by Emperor William, could not be realized, since the claims of the Greeks met with insuperable opposition both in Sofia and in Constantinople.

Not the least of the factors contributing to these unsatisfactory results was the difference of opinion in influential circles in Vienna and Berlin as to the value of the various Balkan States in case of an international conflict. Emperor William was a resolute opponent of King Ferdinand of Bulgaria, whom he did not trust; on the other hand, he was far from convinced that Charles of Rumania would be true to his engagements as an ally. On this account he endeavoured to persuade the Vienna Government to bring Rumania over entirely into the camp of the Triple Alliance, even at the cost of sacrifices and of the danger that Bulgaria might join the opponents of the Central Powers. But Berchtold was afraid that the Bulgarians, left in the lurch by Austria-Hungary, might come to terms with Serbia, Greece and Rumania, and in company with them and with Russia fall upon the Habsburg Monarchy. Hence he held fast to his policy, which saw in the maintenance and exacerbation of the differences existing between Bulgaria and the other Balkan States the only means of preventing the formation of an alliance of all the Balkan peoples against the monarchy. The conflicting points of view of leading statesmen in Vienna and Berlin led to very lively debates, and threatened seriously to impair the good understanding between the two Governments. However, Berchtold gradually succeeded in bringing round the Emperor William and the German statesmen to his views. From March 1914 onwards it was determined that the union of Bulgaria with the Central Powers must remain the main object of their policy, and that agreements with the rest of the Balkan States must only be entered into so far as they should not be in conflict with the just desires of Bulgaria.

The removal of this discord was hailed with all the more joy by the Vienna Cabinet since its relations with Italy were getting more and more strained. San Giuliano, it is true, maintained a correct demeanour towards the Vienna Government and worked for a compromise in the ever-recurring conflicts to which the divergent interests of the two states in the Balkans gave rise. It was even possible, in the discussions which took place between him and Berchtold at Abbazia in April 1914, to arrive at an agreement as to the policy to be pursued by the Italian and Austrian representatives in Albania, made it apparent that influential circles beyond the Alps were endeavouring to frustrate San Giuliano's policy.

In the eyes of leading Viennese statesmen the sympathy for the Triple Entente which was displayed by the Italians with ever-increasing frankness was all the more ominous since they saw that France, Russia and England were taking steps to increase their own military strength, and also had information of the negotiations which were being conducted by all three Governments with those of Spain, Italy and the Balkan States, which were believed to have as their object the isolation of the Central Powers. At that time, however, the outbreak of a world war was not held to be imminent in Vienna, for it was known that negotiations were going on between Berlin and London aiming at the establishment of better relations. Count Mensdorff, the Austro-Hungarian ambassador at the Court of St. James, did his utmost to further these efforts. But conditions in the Balkans pressed for a decision. In Vienna it was believed that France and Russia had been successful in their efforts to bring into existence a Balkan League which should also include Turkey, and which would have threatened the existence of the monarchy.

On June 22 1914, before the assassination of the heir to the throne of Austria-Hungary, Conrad von Hatzendorff, as chief of state, ordered the mobilization of the three army corps of the Emperor which he described the existing conditions in the Balkans as intolerable, and insisted on the necessity for using clear language at Bucharest. The Rumanian Government must be forced, he said, to declare openly whether it would make common cause with the Central Powers or not. In the latter case an attempt must be made to decide Bulgaria, by far-reaching promises, to bring to a conclusion the negotiations for an alliance which had been going on for a considerable time. These views of Conrad's were shared not only in Vienna but also by the other Balkan statesmen of authority. In a memorandum intended for the German Government, which was also drawn up before the murder of Francis Ferdin- and Count Berchtold emphasized the urgency of making every effort to form a Balkan League, under the leadership of the Central Powers, which should include Bulgaria, Rumania, Greece and Turkey, and have as its objective the suppression of Serbia as a political power in the Balkans.

Before this document was dispatched to Berlin the news arrived in Vienna that Francis Ferdinand, with his consort, Sophie, Duchess of Hohenberg, née Countess Chotek, had been murdered in Sarajevo. On July 5 the Vienna Government was handed to the German Emperor by Councillor of Legation Count Alexander Hoyos (b. 1876), who had been sent on a special mission to Berlin, in the presence of the Austro-Hungarian ambassador, Count Ladislau Szögyeny-Marich (1841–1916), and on the following day to the imperial chancellor, Bethmann Hollweg. Authoritative circles in Berlin adopted the views of the Vienna Government, and gave it to understand that it might reckon on Germany's aid even in the event of national differences too be arise from the Austro- Serbian conflict.

It was in reliance upon these promises, which were repeated in the most emphatic way by the German ambassador at the Court of Vienna, Tschirschky-Bögendorf, that Berchtold, at the sitting of the council of ministers on July 7 1914, gave utterance to the opinion that they would be forced at last to a military reckoning with Serbia. His point of view met with general agreement; nevertheless Count Stephen Tisza, the Hungarian prime minister, who had already on July 1st expressed his dissent and the remark of the Russian Foreign Minister, Graf Mme. Joseph, required not only the opening of diplomatic negotiations but also the formulating of demands possible of fulfilment. His first point he carried, but in the second he failed. The council of ministers decided to adopt the course of diplomatic negotiations, but at the same time to lay down conditions the rejection of which would be inevitable. In that case the Serbian question would have to be solved by the power of the sword. Tisza, ill content with this conclusion, reiterated his dissent.
views in a second memorandum of July 8 and counselled moderation, laying stress on the danger of international complications. This view should have been reinforced by the report drawn up by Friedrich von Wissner (b. 1871), who had been sent by the Vienna Ballplatz to Sarajevo, on the circumstances in which the murderous attack on the heir to the throne had taken place. This report established the fact that no direct connexion could be proved between the murderer and the Serbian Government. But this report failed of its effect. Authoritative circles in Vienna remained under the conviction that the Court and Government of Belgrade had for long lent their benevolent support to the whole Serbian movement and to the determination of putting an end to an unbearable situation. The dangers which might arise from drastic measures were indeed weighed; the possibility of a world war was even considered. But the opinion predominated that all must be staked on one card. "Better an end by fear than fear without end," ("Lieber ein Ende mit Schrecken, als ein Schrecken ohne Ende") was the motif of a leading statesman. These circles were confirmed in their resolve to appeal to arms by the pronouncements of Conrad von Hinzendorf, who, in reply to a question, summed up his judgment in the following sense: that the military prospect was a "compromise." The Principal Powers were afraid of a Great Austrian's intervention on the side of the enemy not being yet reckoned with seriously) were no longer so favourable as in previous years, but were certainly more favourable than they would be in the near future. That decided it. On July 14 the decision was adopted of sending Serbia an ultimatum with a short time-limit. Tisza, after long vacillation, acquiesced, but with the condition that Austria-Hungary would make a solemn declaration that—with the exception of necessary minor rectifications of the frontier—he sought no territorial gains at the expense of Serbia. By this means Tisza hoped to placate Russia and to deprive the Italians of any pretext for advancing any claim to compensations under Article VII of the Treaty of the Triple Alliance. This request of Tisza's was indeed taken into account at the conference of ministers of July 19, but on the same occasion Berchtold declared that Serbia was to be made smaller and the provinces taken from her were to be divided among some of the other Balkan States.

The note to Serbia, which had not found its final form till after repeated modification of its language, was read out, and the time for its presentation to the Serbian Government appointed for the afternoon of July 23.

Its essential points ran as follows:—Since the Greater Serbian movement against Austria-Hungary has been proceeded with by Belgrade in recent years with the ultimate object of separating from the Habsburg Monarchy certain of its parts; and since the Serbian Government, by its declaration and acts since March 31, 1909, has not only done nothing towards suppressing it, but has rather encouraged it, the Austro-Hungarian Government must formulate certain demands in order to put an end to this state of affairs. In these demands are included, amongst others, the condemnation of agitation having as its object the breaking away of portions of the monarchy and the adhesion of the peoples against a continuance of this course: both to be accomplished through an announcement in the official press organ and through an army order on the part of the king; the suppression of the Greater Serbian agitation on Serbian soil; the dissolution of societies working for the annexation of districts of the Habsburg Monarchy to Serbia; the appointment of representatives of the Imperial and Royal Government in the measures which the Serbian Government should be under the obligation to undertake with a view to the suppression of the Greater Serbian movement.

The presentation of the note took place at the appointed time; on July 24 the world was informed of its contents. Only Germany, unapproved unreservedly, recognized the Vienna Government; the remaining Powers raised objections. Sazonov, the Russian foreign minister, broke into a violent outburst against Austria-Hungary, and declared it to be a matter of international concern. Sir E. Grey described the note as "the most formidable document" that one State had ever addressed to another. Negotiations began at once between the five Great Powers. They aimed at the extension of the time-limit of 48 hours which had been allowed to the Serbs. England and Russia were especially active in this sense. But Austria-Hungary refused any prolongation of the time-limit. On July 25, shortly before the expiry of the appointed interval, the Serbs handed in their answer. They declared themselves ready to comply with the majority of the demands of the Vienna Government, but with regard to certain points—for instance, where it was a question of the participation of the Austro-Hungarian representatives in the judicial enquiry to be held in the territory of the kingdom of Serbia, they rejected the demand that the officers and officials who were compromised—certain reservations were made; at the same time the Serbs emphasized their willingness to endeavour to reach a friendly solution of the conflict by referring the decision to the Hague Court of Arbitration, or to those Great Powers who had collaborated in the composition of the Serbian declaration of March 31, 1909. But the Austro-Hungarian minister declared Serbia's answer to be unsatisfactory, and diplomatic relations were broken off between Vienna and Belgrade.

The Vienna Cabinet's harsh attitude nowhere met with approbation; the German Government itself did not approve it. The Emperor William indeed was of opinion that Austria-Hungary had gained a great moral victory, and that no cause of war remained. But neither his efforts, nor those of Sir Edward Grey, which were directed towards the mediation of the Great Powers not directly involved, met with success. On July 28 Austria-Hungary declared war on Serbia. The Great Powers now strove to localize the conflict. But all their attempts came to naught. Even the English proposal for direct negotiations and an understanding between the Cabinets of Vienna and St. Peterburg led to no result. On the evening of July 29 the order was given for mobilization in the military area on the S.W. front of Russia situated on the border of Austria-Hungary. On July 31 the Russian order for a general mobilization was issued, and answered by similar measures on the part of Austria-Hungary and Germany. On Aug. 2 Germany declared war on Russia, and the day after on France; on Aug. 4 England and Belgium on Germany; on the 6th Austria-Hungary on Russia; other Powers followed suit. The World War, so long dreaded by the Great Powers of Europe, had broken out. The Central Powers had now to make sure of the aid of their allies and to win new combatants to their side. But the efforts which they made towards this end brought them disappointment upon disappointment. The conversations which had taken place with Italy in July 1914 had made them realize that they could not reckon on an immediate participation of the Italian troops on the side of the Triple Alliance. As early as July 25, moreover, San Giuliano had announced that he would open the question of compensation for Italy in case of an Austro-Serbian war. This announcement he repeated after the declaration of war, but made it clear at the same time that Austria-Hungary was not to expect active support from the Italians, since she had taken the offensive against Serbia. Under pressure from the German Government, which still cherished the hope of deciding Italy, by far-reaching concessions, to take part in a world war on the side of the Central Powers, Berchtold declared himself ready in principle to recognize the Italian claims to compensation for every annexation made by Austria-Hungary in the Balkans, but in any case only on the assumption that Italy would observe a friendly attitude towards the Habsburg Monarchy in an AustroSerbian war, and in case of a world war fulfill her obligations as a member of the Triple Alliance. But as early as Aug. 1 San Giuliano insisted that the casus foederis had not arisen for Italy in the case of the Russians also; for the time being she would remain neutral; but co-operation with her allies at a later time was referred to as not excluded. It was in the same sense, though in the most cordial terms possible, that Victor
Emmanuel answered the telegram in which Francis Joseph expressed his expectation of seeing the Italian troops fighting side by side with those of the Habsburg Monarchy. Still less gratifying to Vienna were the reports which came in at the same time from Bucharest. The hopes which the Emperor William had built on King Charles’s faithfulness to his treaty obligations were not realized.

Attitude of Rumania.

The Rumanian ruler evaded a decisive pronounce-ment as to his attitude in a world war; and Bratianu, the minister-president, did likewise. Cernin, the Austro-Hungarian minister at Bucharest, maintained that at first nothing but neutrality could be reckoned on the part of Rumania, and insisted that the attitude of the Bulgarians and Turks, together with the course taken by the events of the war, would be decisive for the Central Powers. The reality of theiments was to be judged. Bratianu spoke of the necessity of maintaining a balance in the Balkans, and at the same time pointed out the difficulties which would confront the King and the Government in consequence of the hostile attitude of influential Rumanian circles to the Magyars. It was in vain that Francis Joseph and William II. used their personal influence to try and persuade King Charles to take action in the sense they wished. No effect was produced even by the promise made to him by the King on Aug. 2, 1914, that they would help Rumania to obtain possession of Bessarabia, after the war had come to a successful end, if she would join in the struggle on the side of the Triple Alliance Powers. The crown council held on Aug. 4 decided that Rumania could not admit that the casus foederis had arisen. The assurance given by Charles at the same time, that he would safeguard the Rumanian frontiers and apprise Bulgaria that she would have nothing to fear from Rumania if she ranged herself, with the Central Powers, could be of no greater comfort to his disillusioned allies than his solemn declaration that he would never consent to Rumania taking the field against Austria-Hungary.

The Central Powers were rather more fortunate in their quest for new allies than in their attempts to persuade Italy and Rumania to fulfil their engagements. On Aug. 1, 1914, the representatives of Germany and Turkey had signed a treaty by which they bound themselves to remain neutral in the conflict between Austria-Hungary and Serbia; but the casus foederis would arise at the moment when Russia entered the war. In this event Germany promised Turkey military support, and guaranteed her existing territorial position as against the Russians. By identical notes of Aug. 1, 1914, Austria-Hungary adhered after the war had come to a success-ful end, if the war continued, to the Triple Alliance and to the Central Powers.

Negotiations with Bulgaria.

After the outbreak of war, negotiations between Austria-Hungary and Bulgaria were opened by Berchtold, with a view to securing Bulgaria’s active support in cases of emergency. These negotiations were conducted by Austria-Hungary at Sofia for a long time in this sense that they would speedily lead to a profitable result. Austria-Hungary showed herself inclined, in return for Bulgaria’s adhesion to the Triple Alliance, to guarantee her existing territorial possessions, and, in the event of a favourable outcome of the impending conflicts, to gratify Ferdinand’s aspirations towards the acquisition of “ethno-historical boundaries” against states which had not joined the Triple Alliance. By the early days of Aug. 1914, the negotiations had advanced so far that the signature of the treaties with Germany and Austria-Hungary seemed imminent. Berchtold and Bethmann Hollweg pressed for a decision, the latter more especially on the ground that he still hoped to win over Rumania definitely to the side of the Central Powers. If this could be achieved, then Bulgaria, assured against attacks from the Rumanian side, might be prompted to draw the sword against Serbia, and the majority of the Austro-Hungarian troops which were marching against Serbia could be diverted against Russia. But Ferdinand of Bulgaria refused to embark on a war against Serbia. He laid stress on the dangers which threatened his kingdom in such a case from Greece, Rumania and Turkey; he also alluded to the large offers which had been made him by Russia, and held that he could only come to a decision after his relations with Rumania and Turkey had been cleared up and the negotiations for a treaty with these Powers had been concluded. It was clear that Ferdinand of Bulgaria, too, did not wish to enter the war before the preponderance of the Central Powers over their opponents could be assumed with greater confidence. But successes in the field remained to seek for the Central Powers. After the battle of Tannenberg, the campaign of the Austro-Hungarian armies took an unsuccess-ful turn, and decided Ferdinand to be prudent. He declared that he would remain neutral, but for the present he could do no more.

But the ill success of the Austro-Hungarian armies did not produce an effect on the Bulgarian Government only. With the advance of the Russians and their approach to the Rumanian frontiers, the influence of the friends of the Entente at Bucharest increased. The news arriving at Berlin and Vienna at this time caused the worst to be expected. It was the seeds of unrest in the dynasty which was imminent, together with an immediate alliance of Rumania with the enemy, and an advance of Rumanian troops into Transylvania. The most pressing advice reached Vienna from Berlin in favour of far-reaching concessions, even of a terri-torial nature. But, strongly influenced by Tisza, Berchtold refused any concessions in this direction. Under the advice of King Charles, who was already seriously ill, and was torn by a terrible conflict between personal honour and the wishes of his people, the Central Powers sought to work upon public opinion in Rumania. The declaration that the deliverance of the country would be met by an immediate advance of troops into the country. But their threats remained ineffectual, for it was known in Bucharest that the troops necessary for such an enterprise were not forthcoming. In reality Germany was coun-selling Vienna not to oppose the march of Rumanian troops into Transylvania by force of arms, since for the moment a defence of the frontiers was impossible; but rather to tolerate the advance, and to announce that it had taken place in order to defend the territory from occupation by Russian troops. Berchtold refused, and Tisza, whose acrimony over the Ger-man proposals knew no bounds, declared that he would rather see the Russians than the Rumanians in Transylvania. Mean-while the tide of warlike enthusiasm at Bucharest mounted higher and higher. The Government entered into a written agreement with Italy providing for common action on the part of both of them. A crown council was summoned for the early days of Oct., which was to come to a decision against the Central Powers. Only at the last moment was it possible to avert the danger. The crown council was cancelled, and Rumania for the time being remained neutral. A few days later, on Oct. 10, 1914, King Charles of Rumania died. He had not ful-filled the engagements into which he had entered, but he had at least successfully prevented his troops from fighting against the Central Powers.

One of the chief reasons which had delayed the Rumanians in going over to the camp of the Entente was the fear enter-
tained by leading Rumanian politicians that so soon as her
troops had crossed the Hungarian frontier Bulgaria and Turkey
would attack Rumania. The negotiations carried on through
the intermediation of Austria-Hungary between the Courts of
Sofia and Bucharest had then, it is true, been proceeded with,
but had broken down again, this time owing to the reciprocal
distrust and the irreconcilable interests of the two Powers.
At the same time it had become known to those in Bucharest
how closely the Turks had attached themselves to the Central
Powers, and that they were holding themselves in readiness
to enter the World War on their side. Rumania consequently
declared that she could no longer leave Bulgaria a free hand
against Serbia. Thus under the new King of Rumania, Ferdi
nad, instead of his predecessor, the sovereignty of the
sovereigns of Austria-Hungary and Germany, the party
hostile to the Central Powers gained in influence. Ferdinand
did indeed stand firm in his neutrality, and he rejected Russia's
summons to hasten the aid of the Serbians, who had been
attacked by Austria-Hungary. But Czernin could not suc-
cceed in obtaining from him a binding declaration that he would
not let his troops enter the field against the Central Powers.

At this time Germany and Austria-Hungary were equally
powerless to decide the King of Bulgaria to take part in the
intermediate War. Even in the interests of the Entente, with
which Austria-Hungary was still in treaty relations, it was
not possible to press him to enter into the war. At the same
time, however, the inactivity of the Central Powers, and the
orders of Germany to Bulgaria and Rumania, contributed to the
aim at the Balkan and other fronts; so that it is not certain
what the result of the negotiations would have been.

The negotiations with Rumania and Bulgaria were
followed by a similar Polish. They wished to delay
their decision as long as possible; they wished at the
right moment to join the side of the winning party so
as to carry off the greatest possible advantages at the
price of the least possible sacrifices. In these circumstances
the importance to the outcome of the war of Italy's decision
increased every month. For a long time, until far on in the
winter of 1914, the policy of leading Italian statesmen
was dictated by the wish to preserve their neutrality while
keeping up their armament. They accounted for their attitude
by referring to the letter and the spirit of the Triple Alliance; they
maintained a cordial attitude towards the Entente Powers. At the same
time they urged at Vienna their demands for compensations by inter-
preting Article VII. of the Triple Alliance Treaty in their own
favour. It was not at first clear what they meant by it. During
the official negotiations which took place between the Cabinets
of Vienna and Rome, no word was spoken on the Italian side
of old Austrian territories. But it was learnt at the Ballplatz,
by word of Berlin, that Italy was thinking of the Trentino.
Berchtold absolutely refused to listen to any such demands.
He would not hear of a territorial indemnification on any
account, and was warmly supported in this by Tisza, while Con-
rad even at that time, or at any rate in times of military mis-
fortune, considered that even Italian neutrality would not be
too dearly bought at the price of great sacrifices. But neither
the prayers of the leading military commander nor the unceasing
efforts of leading German political and military circles were
able to change Berchtold's mind. He went on, indeed, with
their suggestions, but in a way that was so likely to be
harmless that when Berchtold died on Oct. 16, 1914, nothing
declared had yet happened. Even during the few weeks for
which Salandra, the then Italian minister-president, directed
Italy's foreign policy, no energetic steps were taken. Salandra
fell in with the feeling of the country. It was not until Son-
nino had taken over the leadership of Italy's foreign affairs
that a further advance was ventured on by Italy in view of
the unfavourable military position of the Central Powers, and
the influence of that section of the Italian press which was
at this time in the hands of the Italian military circles. The
negotiations reported in Vienna that Sonnino had spoken in Berlin of the
cession of the Trentino, and that the German Government
was now advocating this sacrifice. But even now Berchtold
refused to entertain the question. Francis Joseph, so it was
said, would never give his consent to a diminution of his empire.
Only Sonnino kept on his way unperturbed. At the beginning of
Dec. 1914—when Austria-Hungary was advancing upon
Serbia—he had a declaration made at Vienna to the effect that
the excited state of opinion in Italy compelled him to press for
the adjustment of the question of compensations. Salandra
supported him, by a declaration made at Rome a few days
before, in which she justly aspiration and legitimate interests, and, while
giving expression to the pacific character of the Italian Gov-
ernment, he stated emphatically that neutrality alone was not
sufficient to assure Italy's interests in all circumstances until
the end of the war.

In the middle of December the negotiations between Vienna and Rome began afresh, but at once came to a deadlock.
The German Government, which attached extraordinary importance
to winning over Italy, now tried to persuade the Ballplaz
of his demands. But the Austrian Government of the
armed intervention of Bulgaria on the side of the Central
Powers. But neither King Ferdinand of Bulgaria nor Rado-
slavov, the Bulgarian minister-president, was willing to con-
cede this, for the military situation of the Central Powers was
for the moment unfavourable. They declared their wish to
remain neutral.

The negotiations with Rumania and Bulgaria revealed the
fact that both Powers, different though their interests might be,
followed a similar policy. They wished to delay
their decision as long as possible; they wished at the
right moment to join the side of the winning party so
as to carry off the greatest possible advantages at the
price of the least possible sacrifices. In these circumstances
the importance to the outcome of the war of Italy’s decision
in the winter of 1914, the policy of leading Italian statesmen
was dictated by the wish to preserve their neutrality while
keeping up their armament. They accounted for their attitude
by referring to the letter and the spirit of the Triple Alliance; they
gave their former allies friendly words, but maintained a cordial
attitude towards the Entente Powers. At the same
time they urged at Vienna their demands for compensations by interpret-
the negotiating Article VII. of the Triple Alliance Treaty in their own
favour. It was not at first clear what they meant by it. During
pared to concede. Sonnino asked for wide territories and their immediate transfer to the Italians. Burian firmly refused the latter proposal, and only offered the greater part of Italian Southern Tirol, and even this on the condition that Italy should preserve a benevolent neutrality towards the Central Powers until the end of the war and leave Austria-Hungary a free hand in the Balkans. Sonnino rejected Burian's offers as insufficient, and during the next few weeks increased his demands. On April 10, on Sonnino's instructions, a memorandum containing Italy's new conditions was handed in at Vienna. They made it clear that Italy was no longer striving to complete her national growth while preserving her former relations with the Habsburg Monarchy, but was aiming at the realization of her national unity and at the achievement of complete supremacy in the Adriatic. She demanded, among other things, the whole of S. Tirol, with the boundaries of the Italian kingdom of 1811, Gorizia and Gradisca, and the conversion of Trieste with its surrounding territory into a community independent of Austria-Hungary; the cession of a number of the most important islands in the Adriatic; the immediate occupation of these lands by the Italians; the recognition of the full sovereignty of Italy over Valona and its territory; and a declaration of Austria-Hungary's désintéressement as regards Albania. In return Italy was prepared to promise neutrality for the duration of the war, and to renounce for this period the construction in her own favour of the provisions of the Triple Alliance Treaty. In spite of the extent of these demands, they were not flatly refused by Burian, since the military situation compelled him to continue negotiations, and German statesmen and generals pointed out to him the disastrous consequences which would follow if Italy went over into the enemy camp. The fall of Constantiople was threatening, the Russians were pressing relentlessly forward, Hungary seemed at their mercy, and it might happen that a declaration of war by Italy would be followed by Rumania, and even by Bulgaria. Then the hemming-in of the Central Powers would be complete and the seal would be placed upon their ruin. Burian could not cast doubt upon these arguments; it was not without influence upon him that Conrad now advocated every concession to Italy. Burian therefore increased his concessions, but did not yield all that Italy demanded. He retreated, rather, step by step, always led by the hope that a new turn would be given to events in the theatre of war; he sought to hold the Italians in place without rebuffing them. But since the latter did not count upon achieving their demands from Vienna, and were convinced that the Habsburg Monarchy would take back again what had been squeezed from it in the hour of need, should the military situation take a more favourable turn, they determined to bring to a conclusion the negotiations which they had long carried on with the Entente Powers. On April 26 1915 the Treaty of London was signed, which pledged Italy to enter the war by the side of her new allies at the end of a month's interval. As compensation for this, it assured the Italians an extension of territory for Italy going far beyond that which she had demanded from Austria-Hungary as the price of maintaining neutrality.

Having come to terms with the Entente Powers, Italy resumed negotiations with the Vienna Cabinet, not with the intention of pursuing them to any profitable end, but rather in order to find in the refusal of the Vienna Government to fulfill Italy's demands just grounds for going over to the enemy camp, and time to complete her warlike preparations. It was, therefore, in vain that Burian, under pressure of both the Austro-Hungarian and German army commands and of the German Government, with further promises and further concessions, on April 21 1915 Sonnino declared that the points of view on either side were too wide apart for the differences to be bridged over; and on April 25 the Duke of Avarna, the Italian ambassador, who had up till then worked untiringly for a friendly understanding, expressed his opinion that a breach was inevitable. Even Prince Bülow, who continued the negotiations at Rome up to the last moment, let it be understood that he no longer believed the Italians to be in earnest in seeking a compromise. On May 3 1915, in fact, the Italian council of ministers resolved to denounce the existing alliance with Austria and to claim full freedom of action for Italy. In vain the Vienna Cabinet made yet further concessions, so that in the end these included almost everything that the Italians had demanded. Sonnino continued indeed to negotiate, but he was always finding fresh reason for postponing a decision. On May 20 1915 the Italian Government received from the Chambers the extraordinary powers necessitated by the approaching conflict, and on the 23rd war was declared by Italy on Austria-Hungary.

One of the chief reasons which had decided Burian to offer such far-reaching concessions to Italy in April and May 1915 was the pressure from the military higher command, and especially Conrad, who never ceased to insist in his memoranda that Italy's entry into the war would be followed by that of Rumania, and on this account adjured Burian to make every sacrifice in order to avert the otherwise unavoidable catastrophe by winning over Italy. That his fears were well grounded was all the less doubtful, since it was already known in Vienna by Feb. 1915 that on Feb. 6-23 the agreement concluded in Sept. 1914 between Italy and Rumania as to their attitude in the war had been renewed for four months and had received an extension to the effect that the two Governments bound themselves to render each other mutual aid in the event of an unprovoked attack on the part of Austria-Hungary. The negotiations as to the cession of Austrian territory, which had been begun with Italy under the impression of this news, had now as their result that Rumania, too, raised the price of her continued neutrality. It was no longer only the Bukovina that was mentioned, but also Transylvania. But Conrad declared that he would not sacrifice a square yard of Hungarian soil, and the Vienna Cabinet agreed with him. The result was an increase of the influence of the Triple Entente in Rumania, which was further heightened by Russia's victories in the Carpathians and the breakdown of the negotiations conducted between Burian and Sonnino. The climax of this spirit of hostility to the Central Powers in Bucharest was reached on April 27 1915, when the Italian minister announced a declaration of war on the Habsburg Monarchy to be unavoidable. Only one thing could restrain Rumania, and decide her to maintain her neutrality; a great victory of the Central Powers over the Russians. And this now happened; the break-through at Gorlitz, on May 2 1915. Its effect was felt at once. Britanii, the Rumanian minister-president, now declared that the position was indeed very critical, but that he hoped to contrive to maintain neutrality; further news of the successes of the German and Austro-Hungarian troops in Galicia and Poland contributed towards strengthening the Rumanian Government in their resolve not to give up their neutrality for the present. In these circumstances even the Italian declaration of war did not alter the Rumanian position; but the altered conditions of the war certainly influenced the attitude of the Vienna Government. Its interest in Rumania now sensibly declined, since her neutrality seemed assured by the military situation.

Since Jan. 1915 the Turks had been successfully defending the Dardanelles against the attacks of the allied Western Powers, but their position was menacinated by the fact that they lacked arms and munitions, which Germany had bound herself to provide as terms of a convention made between Austria-Hungary and Bulgaria; and the latter, to which Sonnino was associated on March 21 1915. It was therefore necessary to establish secure communications with the Turks, and since all the efforts of the Central Powers to obtain the transport of arms and munitions through Rumania remained fruitless, it was necessary to try and make sure of a way through Bulgaria to the Turkish territory. The adherence of Bulgaria would also give a further advantage. With Bulgaria in alliance with the Central Powers, Rumania would be less inclined to risk join-
ing their enemies, as in that case she would have to reckon with Bulgaria, which had not forgiven the wounds inflicted by the provisions of the Treaty of Bucharest in 1913.

It was not an easy matter for the Cabinets of Vienna and Berlin to win over the Bulgarians. Both the King and Rado-

shkov distrusted the Rumanians and Turks, and feared the Greeks and Russians. Moreover, the far-reaching offers of the Entente Powers were not without influence upon them. Their attitude in their dealings with the representatives of the Central Powers was guarded, and they kept increasing their demands. As early as the end of 1914 the Vienna Government, in view of the unfavourable military position in Serbia and Galicia, and in consequence of the pressure exerted upon it not only by the German politicians and military commanders, but also by Germany, had declared its readiness to concede to the Bulgarians, in the event of their entry into the war on the side of the Central Powers, the possession of those Serbian territories to which they advanced historical and ethnographical claims; only, however, so far as they should occupy them with their own troops during the course of the war. The negotia-
tions started at the beginning of 1915 on this basis were pro-
tracted by the Bulgarians, for in view of the unfavourable mili-
itary situation of the Central Powers at the time, King Ferdinand and Radoslavov did not think it expedient to enter into per-
manent engagements. They therefore declared that they could

only, however, at the same time increase the price of their continued neutrality. The entry of Italy into the war against the Central Powers, and the increasingly extensive offers on the part of the Entente, added to the difficulty of the negotiations between Vienna and Sofia. But gradually the conviction gained ground in Sofia that adherence to the Central Powers would serve the interests of Bulgaria better than an alliance with Austria and Hungary. For it would be easier for the former to concede the extensions of territory desired by Bulgaria in Macedonia at Serbia’s expense, whereas the Entente Powers were bound to fear that similar concessions on their part would give offence to their faithful ally Serbia. The Triple Entente failed in their efforts to persuade the Serbs to consent to this sacrifice by promising them, in the event of ultimate victory, the possession of Bosnia, Herzegovina and Dalmatia, for Bulgaria demanded immediate possession of the Macedonian territories promised her, while Serbia was willing to confine herself to the possibility of these territories being postponed until she herself should have secured the extension of territory promised to her by way of compensation.

It was only when the continued victorious advance of the Germans and Austro-Hungarians in Poland made the prospects of the ultimate victory of the Central Powers in the World War seem very favourable, that the advantage to be gained by joining them was definitely recognized at Sofia. From July 1915 onwards negotiations were energetically carried on. The Central Powers insisted on the signature of a military convention in addition to the treaty of alliance, and that Bulgaria should at the same time conclude a treaty with the Turks. After innumerable difficulties had been surmounted, the treaties between Austria-Hungary and Bul-

garia were signed on Sept. 6 1915. The most important article of one treaty contained a guarantee by Austria-Hungary of the independence and integrity of Bulgaria against any attack not provoked by Bulgaria herself; this guarantee to be valid for the duration of the alliance, i.e. till Dec. 31 1920, and after that for a year, and so on until the treaty should be denounced in proper form. Bulgaria, for her part, undertook to give Austria-Hungary proportionate armed assistance in the event of the monarchy being attacked by a State bordering on Bulgaria, and demanding her aid. The second agreement, signed on the same day, contained a pledge from Bulgaria that she would take the offensive against Serbia, in return for which is now Serbian Macedonia—the so-called "disputed" and "non-
disputed" zones, as established by the Serbo-Bulgarian Treaty of March 13 1912—was promised to her. In the meantime it was agreed that, in the event of an attack by Rumania on Bul-

garia or her allies—including the Turks—which should not have been provoked by Bulgaria, Austria-Hungary would consent to the recovery by Bulgaria of the territory ceded by her to Rumania by the Peace of Bucharest, and a rectification of the Rumanian-Bulgarian frontier as defined by the Treaty of Berlin. A similar promise was made to Bulgaria, under the same conditions, with regard to the territory ceded by her to Greece by the Peace of Bucharest. The military convention signed on the same day settled the provisions for the carrying-out of the impending joint offensive against Serbia. The negoti-
tiations between the Turks and Bulgarians, which had been going on for a year past, were also brought to a conclusion on Sept. 6, thanks to persistent pressure from the Central Powers.

Turkey gave in on the essential point by agreeing to a rectifica-
tion of the frontier in favour of Bulgaria on both banks of the Maritsa.

The significance of the adhesion of Bulgaria to the Central Powers lay in the fact that it secured their communications with Turkey, and also the possibility of a victorious campaign against Serbia. The campaign now began and proceeded according to programme. Though valiantly defended by the Serbs, and indeed by the Bulgarians also, it was overthrown by the Turkish army, and on Oct. 11 the Ottoman army was able to march into Sofia. The Treaty of Bucharest, therefore, had been concluded at the end of 1915, into the hands of the Central Powers and Bul-
garia. Shortly afterwards Montenegro shared the same fate.

The year 1915 also brought "Congress Poland" into the possession of the Central Powers. After the fall of Warsaw (Aug. 5 1915) General Governments were set up on behalf of Germany at Warsaw and on behalf of Austria-Hungary at Lublin, to which all govern-
ment powers were handed over. At first the Central Powers had not contemplated the permanent acquisition of "Congress Poland," It was merely considered as a pawn and an item of reparation to the Allies, and was henceforth retained for a time as a guarantee for the future occupation by the Central Powers of Poland. But after the fall of Warsaw, the Cabinets of Vienna and Berlin tried to arrive at an agreement as to the future destiny of Poland. The most diverse solutions were discussed, but no definitive agreement was arrived at by the end of the war. The idea of handing Poland back to Russia was indeed repeatedly advanced by Germany—
both in the year 1915 and again very actively after July 1916—
when Stürmer was at the head of foreign affairs in the empire of the Tsar. But since the condition of such a solution—namely a total separation of Russia from the Entente—could not be brought about, it was also felt that it would be possible to divide the whole of the conquered territory of Poland between Austria-
Hungary and Germany was also considered. But insuperable difficulties arose in the course of the negotiations, particularly with regard to the frontiers of the respective territories. It was also foreseen that the Poles would not voluntarily submit to a new partition of their country and that they would struggle for its reunion. It was feared, moreover, that far-reaching differences between the Allies would be revealed the moment economic and military questions should come under discussion. The idea of annexing "Congress Poland" to Germany, first ventilated by a section of public opinion and in military circles in Germany, was rejected not only by the Vienna Cabinet but also by the German Imperial Chancellor, since he feared the increase of Polish influence in Germany that would be bound to follow. The plan advocated for a time by Bethmann Hollweg,
of founding an independent Polish buffer state, which should be in economic, political and military alliance with the Central Powers, also split upon the opposition of the Vienna Government. Thus the union of "Congress Poland" with the Habsburg Monarchy, which Burian had proposed in Aug. 1915, and which had been advocated by the writings of Count Andrassy among others, stood out more clearly as the only possible solution of the Polish question. But this, too, presented great difficulties on closer examination. There were adherents of the idea of a personal union and on the other hand of an actual union; among the latter were those who were in favour of a trialetic form for the new great Austro-Hungarian State, who advocated the incorporation of Poland in the Austrian State.

Under the influence of the Hungarian Government, whose spokesman, Count Tisza, protested in the strongest terms against the organization of the hangover on a trialetic basis, the idea now prevailed of annexing Poland to Austria-Hungary and granting to the united territory of Poland, with the addition of Galicia, a far-reaching autonomy. This had the further object of diminishing the damage to the interests of the German-Austrians which was feared by wide circles in Austria and Germany. Since the autumn of 1915 negotiations were carried on between the Austrian and Hungarian Government on this basis. But the more deeply the question was gone into the greater were the difficulties which presented themselves. Bethmann Hollweg declared that the German people could only agree to such a strengthening of Austria-Hungary in the event of the German Empire coming out of the war with an equally large increase of territory. Economic and military objections were also advanced on the German side, and as a solution it was proposed to incorporate a small portion of "Congress Poland" with Austrian Galicia, and out of the greater part of the rest to create a Polish State independent in form but in reality under the protectorate of Germany. But this proposal was firmly rejected by the Vienna Government, which for its part advanced the idea of a genuinely autonomous State comprising the whole of Polish territory, which should be allied by a long-term economic and military agreement with both the Central Powers equally. But it was impossible to win the consent of the Berlin Government to this plan.

Such was the position when the Austro-Hungarian troops were defeated at Lutsk. The result of this was that in Aug. 1916 the Germans carried the day with their proposal to found an independent Polish State, practically realizing the "Congress Poland" under a hereditary constitutional monarchy, but subject to the most far-reaching limitations in military and economic matters. On the Austro-Hungarian side the bestowal of the crown of Poland on a member of the family of Habsburg-Lorraine was waived. A more exact definition of the sphere of influence of the Central Powers was reserved for further discussion. But their subsequent course showed that the opposition of interests was too deep-seated for it to be possible to settle matters in a hurry. In Oct. 1916, therefore, they came to an agreement for the present to shelve the question of an independent Polish State. But in order to calm the Poles, who were anxious about their fate, and to secure the assistance of their armed forces for the Central Powers, a proclamation was issued on Nov. 5 1916, in which a prospect was held out of the restoration of an independent Poland as a hereditary constitutional monarchy closely attached to the Central Powers. But the two military governments at Warsaw and Lublin continued to administer the country.

Even before this agreement had been arrived at, Rumania had actually gone over to the Entente camp. The Central Powers had indeed not been wanting in offers to the Rumanian Government between Italy's entry into the war (March 1915) and the conclusion of the treaties with Bulgaria (Sept. 1915), but had made their concessions conditional on the active intervention of Rumania on their side. But the leading statesmen of Bucharest would not agree to this; for in spite of the great military successes of the Central Powers, their final victory seemed to them doubtful. They accordingly continued to insist on important cessions of territory in the Bukovina and Transylvania by Austria-Hungary in return for a continuance of their neutrality. To this, however, Burian, strongly influenced by Tisza, refused to agree, although not only the German Government but also Conrad von Hützendorff actively supported Rumania's demands. Thus the negotiations, which had been reluctantly continued by Burian, remained without results. Even Bulgarian's adherence to the Central Powers, and the successful campaign against Serbia, did not produce any change in the attitude of the two Entente Governments. The majority of Rumanian politicians continued to call for a rapid change in the military situation, and the Entente diplomats made every effort to confirm this in belief. But the Rumanian Government maintained its conviction that it must for the present preserve its neutrality. It was the Russian victories at Lutsk and Okna which first led to a change in their views. At the end of July 1916 the Vienna Cabinet was aware, from its ambassador, Count Czernin, that preparations for war were being completed in Bucharest, that negotiations were being carried on with the Entente Powers as to the conditions of going over to them, and that the probability was that Rumania would draw the sword as soon as the harvest was garnered. In spite of this, and though the news during the next few weeks was more and more unfavourable, Burian firmly refused the demands made by Rumania for the maintenance of their neutrality, and was not to be moved from his resolution even by the German Government and Conrad von Hützendorff. And so towards the end of August the union of Rumania with the Entente Powers was accomplished, in return for far-reaching territorial concessions granted by them to their new ally at the expense of the Austro-Hungarian Monarchy. On Aug. 27 on the day of Italy's formal rupture with Germany—followed Rumania's declaration of war on Austria-Hungary, and hostilities began without delay. But the hope of the Entente that Rumania's entry on their side would quickly decide the war in their favour was not fulfilled. After preliminary Rumanian successes against the weak troops of the Habsburg Monarchy, the armies of the Quadruple Alliance, fighting under German leadership, achieved a decisive victory. On Dec. 6 1915 Bucharest was taken, and at the beginning of Jan. 1917 two-thirds of Rumania was occupied.

Turkey's danger had grown through the entry of Rumania into the war on the side of the Entente Powers. She, therefore, proposed further territorial demands. So early as Sept. 28 1916 Germany assured the Porte that, in accordance with her treaty engagements, she would not conclude a separate peace, would allow Turkey a share, proportionate to her military efforts, in any territorial conquests, and would not agree to any peace so long as Turkish territory was occupied by the enemy. Soon afterwards, on Jan. 11 1917, a further agreement was arrived at between these two Powers, in which the abolition of the Capitations, which Turkey found oppressive, was contemplated. The provisions of these two treaties were expanded in a manner favourable to Turkey on Nov. 27 1917. The Austro-Hungarian Government, after long hesitation, associated itself on March 22 1917 with the German settlements of Sept. 28 1916 and Jan. 11 1917. But her ratification was not given. A treaty was signed between Austria-Hungary and Turkey on May 30 1918 as to the question of the Capitations, which corresponded to the Turco-German one of Nov. 27 1917, and by which Austria-Hungary pledged herself not to sign any peace which should reestablish the Capitations.

The success of the Central Powers in Rumania was a ray of light in the last days of the Emperor Francis Joseph I., who had entered the war with a heavy heart, and always remained full of anxious care as to the fate of his empire. His armies and those of his allies had achieved decisive victories in several theatres of war in the course of the year 1916; they had occupied new territories, and in other quarters had successfully repelled the increasingly formidable offensive of their enemies. The battles on the
AUSTRIAN EMPIRE

Isouzo had thrown the heroism of the Austro-Hungarian troops into particularly clear relief. But the number and military efficiency of their enemies increased, and since Great Britain commanded the sea and the United States supported them more and more lavishly, the Entente armies had at their disposal vast masses of arms and munitions of every kind and also immense supplies of foodstuffs. The Central Powers, thrown back upon their own industrial resources, and hampered in the import of foodstuffs and the production of weapons by the British blockade, could not keep pace in the race. For this reason the desire to put an end to this internecine struggle of the nations grew from month to month, especially in Austria-Hungary, where from the beginning of the war a great part of the population had only fought unwillingly for interests which were not regarded as their own. In the course of the year 1914 Francis Joseph, for his part, had not refused to listen to suggestions for a peace which should take into account the most important interests of his empire; he had approved the numerous proposals for peace which in the years 1915-6 had come from more or less authoritative quarters; but he had always insisted most strongly that these negotiations must be conducted in full agreement with his allies, and especially with Germany. But all these peace proposals had proved abortive, since neither Germany nor Austria-Hungary saw the possibility of ending the war on any terms commensurate with the military situation and their desires. But in Oct. 1916, in order to prove to the public opinion of the world that it was not the insatiableness of the Central Powers that called for peace, he proposed to the German Imperial Chancellor, at the general headquarters at Pless, that the Quadruple Alliance should inform their enemies, through neutral channels, of their conditions of peace, and also publish them, in order to enlighten their own peoples as to their war aims and win over the neutral Powers to an active intervention with the enemy Governments. Bethmann Hollweg and the other German statesmen agreed in principle with Burian’s idea. But they declined, for their part, to communicate their concrete peace conditions, since they felt themselves bound, especially in the Belgian question, to advance demands which their enemies, and especially Great Britain, could not possibly accept. On this point excited debates took place and serious conflicts between the Vienna and Berlin Cabinets, in the course of which the Austrians demanded the recall of Tachischky, the German ambassador at the Court of Vienna, who represented the German point of view with uncompromising harshness. Even the sovereigns of Austria-Hungary and Germany took part in this conflict. The Emperor William sought insistently to convince his ally that Germany could not fall in with Burian’s plan. It was one of Francis Joseph’s last acts to invoke every means in order to accomplish a settlement of the outstanding difficulties. It was only after long negotiations—Francis Joseph having in the meantime died on Nov. 21 1916—that it was possible to reach a compromise. It was agreed to submit the proposal of the Quadruple Alliance to their enemies through the neutral Powers, and immediately to enter upon deliberations as to a peace, in which the peace conditions of the Quadruple Alliance should be exactly defined.

The death of Francis Joseph and the accession of the Emperor Charles to the throne of Austria-Hungary notably reinforced the peace party at Vienna. In his very first declarations Charles emphasized his firm intention of doing everything in his power to put an end to the terrible world conflict. In this attitude he was most strongly confirmed by his wife, Zita, by her mother, the influential Maria Antonia of Parma, and by his brothers-in-law, Sixtus and Xavier. On Dec. 12 1916 the peace offer of the Quadruple Alliance was made public. It contained a promise to submit to a conference of the Powers proposals which should aim at assuring to their peoples existence, honour, and freedom of development, and at laying the foundations of a lasting peace. In conversations with Germany, Austria-Hungary defined her standpoint as follows:—She claimed the integrity of her territory, tri-

ling frontier rectifications as against Russia, a more favourable strategic frontier against Rumania, the cession to Austria-Hungary of a small portion of the territory of the Serbian Monarchy and of larger portions to Bulgaria and Albania, and a more favourable strategic frontier against Italy; in addition to this the economic union of Serbia with the Habsburg Monarchy, and Albanian autonomy under an Austro-Hungarian protectorate. Independently of the peace activity of the Quadruple Alliance, Mr. Woodrow Wilson, who had shortly before been re-elected President of the United States, on Dec. 18 1916 invited the belligerent Powers to communicate their peace terms, and had a note handed in at London in this sense on Dec. 21. Both proposals, however, were declined by the Entente Powers. On Dec. 30 1916 Briand, on the part of France, declared the peace offer of the Quadruple Alliance to be a war manoeuvre, and that all negotiations were useless, so long as no security was given for the restoration of violated rights and liberties and the recognition of the right of peoples to self-determination. In the note drawn up in concert by the Entente Powers on Jan. 17 1917, in reply to President Wilson’s communication of Dec. 18, all the blame for the outbreak of war was imputed to the Central Powers, and the demand was formulated, among other things, for compensation for all war damages, the restoration of Alsace-Lorraine to France, and from Austria-Hungary in particular proportionate cessions of territory to Italy as well. The German Government, which had by now fallen into more and more obvious dependence on the higher army command, thereupon resolved to defy the war by the course of measures, the most important and most promising of which was indicated in authoritative quarters to be unlimited submarine warfare.

Baron Burian, meanwhile, had ceased to be Austro-Hungarian foreign minister on Dec. 22 1916, being succeeded by Count Otto- kar Czernin, the former ambassador at Bucharest. Austro-Hungarian statesmen generally did not share the exaggerated expectations of German military circles as to the effects of the submarine campaign, and Czernin in particular gave open expression to his doubts about the subjugation of England within a few months, which the German authorities seemed to regard as certain. He drew attention to the danger of an active intervention of the United States, if unlimited submarine warfare were entered upon. The Emperor Charles shared his minister’s views. But the continual pressure of German statesmen and the German higher command, powerful supported by the Emperor William, at last succeeded in obtaining the consent of the Austro-Hungarian Government to the unlimited submarine warfare. The war was resumed by Germany and her allies by land, by sea and in the air on Dec. 19 1917. In March 1917 the employment of the submarine for decisive successes was not realized. During the year 1917 there were indeed moments in which it looked as if the final decision would be in their favour. But their enemies, in spite of all the successes of the Central Powers and their allies, rejected all thoughts of a peace unsatisfactory to them.

The opening of unlimited submarine warfare was followed immediately by the rupture of diplomatic relations between the Cabinets of Berlin and Washington, and on April 6 1917 by the declaration of war on Germany by the United States. It was not till Dec. 7 1917 that the United States declared war on Austria-Hungary. Meanwhile, since the successes of the submarine warfare, though in themselves considerable, did not produce the result foretold by Germany, the Emperor Charles’s inclination towards peace grew from month to month. Under the influence of his entourage he determined, by secret negotiations with the enemy, to work for a peace which should include a guarantee of the integrity of the Habsburg Monarchy by the Entente Powers. His brother-in-law, Prince Sixtus of Bourbon Parma, undertook the role of mediator. On March 17 1918 he was empowered by him, by letter, to declare to M. Poincaré, President of the French Republic, that in order to obtain peace he would
exert every effort in his power to support the just claims of France to Alsace-Lorraine vis-à-vis his allies. In other questions too, notably in that of Belgium, the Emperor Charles showed a wish to further the desires of the enemy Powers as far as possible. On the other hand, there was no mention in Charles's letter of any readiness to cede Austrian territory to Italy. Count Czernin, who was well informed as to essentials in the negotiations, but was unacquainted with the text of the imperial letter, endeavoured in the meanwhile to win over the German Government to the idea of peace. On March 27 1917 a government-appointed commission arrived at Vienna to meet with Lord Lansdowne and Herr Hollweg which provided for a minimum and maximum programme. In the former the restoration of the territorial status quo ante bellum of the Central Powers in the E. and W. was laid down as the condition precedent to their evacuation of the occupied provinces of Russia (except Poland), Serbia, Albania, Greece and Rumania; in the latter, which was to hold good in the event of the war taking a more favourable turn, provision was made for a permanent acquisition of enemy territory in proportion to their cessions of territory by the allies. In the field of expansion was to be in the East, Austria-Hungary's in Rumania.

Shortly afterwards, April 3 1917, the Emperor Charles and Count Czernin arrived at Homburg as guests of the Emperor William. Czernin here came forward with a proposal (the connexion with Prince Sixtus's démarche being noteworthy) that Germany might make concessions to France in Alsace-Lorraine, and as a substitute for her losses in the West take permanent possession of a Poland supplemented by Galicia. These plans found a basis in the prospect of concluding a favourable peace with Russia, which had opened up shortly before the abdication of the Tsar Nicholas II in March. To reinforce his efforts, Count Czernin, on April 14, sent to the Emperor William a report, drawn up by himself and the Emperor Charles in person, in which the internal situation of the Habsburg Monarchy was painted in the blackest colours, and its collapse, involving a revolution and the downfall of the dynasty, was represented as imminent. At the same time Czernin renewed in authoritative quarters in Germany his offer to compensate the German Empire for eventual losses in Alsace-Lorraine by the permanent acquisition of Poland enlarged by the addition of Galicia. But the Emperor William and his counsellors refused to open negotiations with the enemy on this basis, and urged the continuation of the war. It soon afterwards became clear that the secret negotiations conducted by Sixtus of Parma with the Entente Powers would not lead to the results desired by the Emperor Charles and Czernin. For Italy held by her bond, and demanded the cession of all those provinces of the Habsburg Monarchy which had been promised her by the Treaty of London of April 26 1915. To this, however, the Emperor Charles, particularly in view of the military situation at the time, neither would nor could consent.

The negotiations with the Western Powers having thus for the present led to no tangible results, the Emperor Charles and Kreuznach Agreement with Germany. Count Czernin decided at Kreuznach (May 17-18 1917) to come to an agreement with the German Government, in which there was no further mention of the cession of Alsace-Lorraine, but in which it was stipulated by Austria-Hungary that not only should her integrity be guaranteed but she should receive considerable accessions of territory in the Balkans. Germany, furthermore, agreed in the Treaty of her being able to carry out the territorial incorporation (Angliederung) of Courland and Lithunia, together with the dependence (Anlehnung) of Poland contemplated on the German side," that "Rumania so far as occupied, with the exception of the Dobruja (frontier anterior to 1913) and a border strip to the S. of the Cernavoda-Constanza railway, falls as a separate State into the Austro-Hungarian sphere of interests, subject to a guarantee of Germany's economic interests in Rumania." On the fulfilment of these conditions Austria-Hungary consented to renounce her condominium in Poland, and promised to declare her désintérèsement, political and military, in Poland. On June 8 1917 the Emperors William II. and Charles signed an agreement as to Poland's military forces, by which their organization was placed entirely in the hands of Germany.

The war continued. The Quadruple Alliance waged it with the exertion of all its military strength, and even now gained not inconsiderable successes. On the western front the Germans held at bay the attacks of the French and British troops, lavishly furnished with war material. On the eastern front the armies of the Alliance fought successfully against the Russians. In the S. the armies of Austria-Hungary, stiffened by German troops, undertook an invasion of Italy which led to the occupation of further Italian territory. But all these successes did not suffice to compel a desire for peace on the part of the enemy, while, in the countries of the Quadruple Alliance, war weariness, furthered by a skilfully managed propaganda on the part of the Entente, kept spreading to wider circles among the soldiers and citizens of the Central Powers and their allies. This feeling among the public, and the recognition of the fact that the war could only be ended by diplomatic means, decided Czernin to resume with the greatest energy his efforts to achieve a peace which should preserve the vital interests of the monarchy. In this he was strongly supported by the declaration made by the majority in the German Reichstag on July 19 1917 in favour of a peace by agreement, in which the forcible acquisition of territory, and oppressive political, economic and financial measures were repudiated, and the freedom of the seas and the renunciation by the enemy of the economic blockade of the Central Powers were demanded. Yet neither the Pope's official efforts for peace nor the secret Reventlow-Armand (July-Aug. 1917) and Meshedorf-Smuts (Dec. 1917) negotiations led to tangible results, since the enemy had exact information as to the critical internal situation of the Powers of the Quadruple Alliance, and, counting upon the strong support of the United States for the following year, made conditions to which, in view of their favourable military situation at the end of the year 1917, Germany and her allies would not accede. At this time, moreover, the prospect was opening to them of concluding a favourable peace with their enemies in the E. which would enable them to fall with their full strength upon their enemies in the West.

The revolution which had taken place in Russia in March 1917 had not brought peace; on the contrary, the numerous negotiations which took place between the Central Powers and Russia, having as their aim the conclusion of a separate peace, dragged on inconclusively. The war went on; it was waged successfully by Germany, and brought wide territories in the East into the possession of the allies. But a decisive change took place for the first time in the attitude of the Russian politicians in Nov. 1917, when the second phase of the Russian revolution—the "social revolution phase" led by Kerensky—was succeeded by a third, that of the "Bolsheviks," led by Lenin and Trotsky. As early as the end of Nov. 1917 the new Government summoned all the combatant Powers to enter immediately upon an armistice and begin negotiations for the conclusion of a general peace, which should assure to every nation freedom of economic and cultural development. When the Entente Powers refused to comply with this summons, the Russians on Dec. 3 entered into a suspension of hostilities with Germany and her allies, which was to last till Dec. 17. On Dec. 15 the suspension of hostilities was succeeded by an armistice, which was to last till Jan. 14 1918 and then be renewed if the Powers did not announce it on seven days' notice. Peace negotiations began on Dec. 22 at Brest-Litovsk. They were conducted in public. The upshot was that on Dec. 23 the Quadruple Alliance accepted the Russian proposals for the conclusion of a peace without annexations and indemnities as the basis for a general peace. At the suggestion of the Russian delegates, the negotiations were suspended for ten days and a request was addressed to the enemies of the Quadruple All-
ance that they should take part in further deliberations on the basis of the resolutions adopted on Dec. 25. But the Entente Powers refused. Thereupon negotiations were begun (Jan. 9 1918) for a separate peace between Russia and the Quadruple Alliance. But they did not run so smoothly as the majority of Austro-Hungarian politicians had hoped. Trotsky, the chief of the Russian delegation, demanded full freedom for the plebiscites to be held in the Russian provinces occupied by the Central Powers, and with this object proposed that their troops should evacuate them. On the rejection of this proposal by the German and Austro-Hungarian delegates, Trotsky protracted the negotiations in order meanwhile to introduce Bolshevist ideas into the territories of the Quadruple Alliance. The progress of the negotiations was hampered by quarrels among the Russians, and by the appearance at Brest-Litovsk of an Ukrainian delegation which pressed for the establishment of a Russian federal republic. Since on this question no agreement could be reached, the representatives of the Ukraine, on Jan. 24 1918, announced the complete independence of the Ukrainian People's Republic, and on Feb. 9 concluded a separate peace with the Quadruple Alliance, which, so far as Austria-Hungary was concerned, left the frontier between the two States unchanged. Inspired by his eagerness to bring to the starving population of Austria, and above all to the inhabitants of Vienna, the longed-for "breath of peace," which stipulated for the delivery of foodstuffs from the Ukraine, Czernin, in compliance with the violent desire of the Ukrainian delegation, carried out their demand for the incorporation of the district of Chelm in the newly created republic, and for the erection of East Galicia into an autonomous Austrian crown territory.

The negotiations with Russia had meanwhile been continued. Czernin, zealously seconded in his efforts for peace by the Emperor Charles, pressed for a conclusion, but met with determined opposition from the German negotiators. He also complained to Russia of her refusal to ratify the Treaty of Brest-Litovsk, announcing a formal treaty of peace, regarded the state of war against the Quadruple Alliance as at an end, and would reduce her troops to a peace footing on all fronts. But since this solution did not meet with the whole-hearted consent of the Central Powers, Germany resumed the struggle. The Austro-Hungarian troops did not enter into the war against Soviet Russia, but after a few days joined the march of the German troops into the Ukraine. The Russians, defeated by Germany in the field, now changed their tactics and declared themselves prepared to conclude a formal peace, which was signed upon March 3 1918 at Brest-Litovsk. The fact that the Habsburg Monarchy no acquisitions of territory, but, by the official retirement of the Russians from the ranks of their enemies, it involved a considerable strengthening of the Quadruple Alliance.

Poland had become independent of Russia by the provisions of the Peace of Brest-Litovsk; but this did not settle the Polish question. The negotiations conducted by the Cabinets of Vienna and Berlin as to the fate of Poland in the spring and summer of 1917 led to no issue, since neither the Central Powers nor the Entente Powers were shown to be irrecusable. The plan advocated by Austria, that the Archduke Charles Stephen should be made regent, and afterwards king, was accepted neither by the Emperor William nor by the German Government. In the autumn of 1917 the decision made earlier in the year to abandon Poland to Germany and compensate Austria-Hungary in Rumania was given up, and the Austro-Polish solution advocated by the Emperor Charles and Czernin was approved in principle. In the negotiations which followed as to the carrying-out of this plan, however, the old opposition of interests again became apparent. Germany declared that she would make her acquiescence in the Austro-Polish solution contingent upon the cession to her of large portions of Polish territory, as "rectifications of frontier," and, beyond this, upon her retaining a decisive influence upon the utilization of the economic and military forces of a Polish State which was not to be incorporated in Austria-Hungary but merely joined to her by a personal union. To this, however, the Vienna Government would not agree, and once more the attempt to reach a definitive solution of the Polish question had broken down. The Poles, anxious about their future and keenly desirous to make it as favourable as possible to themselves, took advantage of these differences to continue negotiations with both sides, in order to secure for their state the widest possible territorial extension and the greatest possible measure of independence. They resolutely protested against the cession of the district of Chelm to the Ukraine, and on March 4 1918, with the aid of the Poles in the Habsburg Monarchy, they succeeded in obtaining the signature, by the Powers concerned in the conclusion of the Peace Treaty of Feb. 9, of a protocol in which it was laid down that the frontiers between Poland and the Ukraine were to be settled by a new agreement, arrived at with the cooperation of the Poles, and perhaps to be altered in favour of the Poles. The negotiations between the Cabinets of Vienna and Berlin as to the future destiny of Poland still went on. The former clung to the Austro-Polish solution, but it was evident from many indications that the German Government showed less and less inclination to consent to it. In July 1918, after the luckless Austrian offensive in Italy, the German Imperial Chancellor, Count Hertling, declared that he would no longer recognize the Austro-Polish solution. Poland, on the contrary, held out the prospect of her future form of government, but before its establishment must come to arrangements with the Central Powers, permanently calculated to secure their economic and military interests. Austria-Hungary agreed with these proposals in principle. But the negotiations which were now entered upon led, like all the preceding ones, to no definitive results, though they provided the Poles once more with the desired opportunity for fishing in troubled waters.

The ending of the war between Russia and the Quadruple Alliance also compelled the Rumanians to conclude peace with the victors, having already, on Dec. 17 1917, had submitted to an armistice. After rather long negotiations the peace preliminaries were signed at the château of Butea near Bucharest on March 6 1918, and on May 7 the definitive peace; but the latter was not ratified by Rumania. Austria-Hungary received a favourable strategic frontier in the Carpathians, important economic concessions, and the promise of an immediate evacuation of the provinces of the Habsburg Monarchy still occupied by Rumania. King Ferdinand had to thank the personal intervention of the Emperor Charles, who, taking advantage of the fact that the Habsburg Monarchy had no acquisitions of territory, but, by the official retirement of the Russians from the ranks of their enemies, it involved a considerable strengthening of the Quadruple Alliance.

Exhaustion of the Monarchy.
Germany should have handed in precise declarations which should meet their views in the questions of Belgium and Alsace-Lorraine. It was, then, very opportune for the Court of Vienna when President Wilson, in his message to Congress of Jan. 8 1918, defined the Fourteen Points, in which he perceived a suitable basis for the establishment of a lasting peace. It is true that several of these points involved considerable damage to Austro-Hungarian interests; but in their entirety they seemed to afford Czernin the possibility of initiating peace negotiations.

He endeavoured in divers ways, and especially through the mediation of the King of Spain, to enter into negotiations with President Wilson, but failed to attain his end. Equally fruitless were the informal conversations carried on by Austro-Hungarian representatives, in intelligence with their Government, with French delegates in Switzerland and other places. Czernin firmly refused the demand of the Western Powers for the conclusion of a separate peace; but he continued his efforts at negotiation, though he knew that German headquarters had prepared a new campaign in the West which was intended to be decisive.

At the beginning of April 1918, shortly after this German offensive had successfully begun, Czernin emphasized, in an address to a delegation of the Viennese town council, his loyalty to Germany, as proved by his rejection of the French peace offers, which were conditional on the recognition of France’s claims to Alsace-Lorraine. Clémenceau, the French prime minister, declared this assertion to be a lie, and, in the course of the publicist feud that followed, published among other things the letter of the Emperor Charles to Prince Sixtus of March 24, 1917, in which he alluded to his willingness to advocate with his Allies France’s “just claims” to Alsace-Lorraine. The Austro-Hungarian monarch’s loyalty to his alliance was thus placed in an equivocal light, and Czernin’s refusal to accept full responsibility for the Emperor Charles’s proceedings led to his resignation, Count Burian being reappointed as his successor. In order to calm the agitation of the Emperor William and the German statesmen and generals, the Emperor Charles had to make another “journey to Camossa” at Spa, and there, on May 12 1918, he set his signature to agreements for a closer political and military union between the two countries, the coming into force of which would have meant heavy damage to the independence of Austria-Hungary. But since the condition of the validity of this treaty, namely an understanding between the two Powers on the Polish question, broke down, the Spa agreement, too, remained a scrap of paper.

Meanwhile Germany was putting forth her last strength in the hope of achieving a decisive success. But her initial successes were followed by reversals. Austria-Hungary had taken part in the battles of Manastir and Loos only within modest limits. In June 1918 she attempted a sudden attack on Italy with the principal body of her troops. But here, too, the decisive victory which had been expected was not achieved. These failures, together with the ever-increasing lack of effective soldiers, arms, munitions and foodstuffs, deepened the longing of the peoples of the Habsburg Monarchy for peace. In addition, the Emperor Charles became alive to the more and more open opposition of the non-German and non-Magyar peoples of his dominions, and likewise to the revolutionary spirit that was beginning to pervade the working-classes in many places, and he began to tremble for his crown and the fate of the dynasty. In proportion as the German hope of extorting peace by force of arms diminished, a more favourable prospect seemed to open up for the efforts of Austro-Hungarian statesmen to put an end to the war by way of diplomatic negotiations. At the end of July 1918, Baron Kühlmann, the German Secretary of State for Foreign Affairs, had been compelled to resign in consequence of his saying in the Reichstag that an end of the war through a purely military decision could not be expected. Kühlmann, who had played a prominent part in bringing about Kühlmann’s fall, declared at headquarters in Spa that they could no longer hope to break the military spirit of the foe by force of arms. Thus when Burian again approached the German Government, he no longer met with any opposition on principle. Yet great differences presented themselves in the course of the negotiations as to the course to be adopted. The Germans wanted to wait for an improvement of the military situation in the West and then begin negotiations with the enemy through a neutral Power—Holland or Spain—while Austro-Hungarian statesmen advocated an immediate and open appeal to all the combatant Powers. At the beginning of Sept. 1918 the German Minister Hintze spent some time in Vienna in order to arrive at an agreed course of action. But since this could not be achieved, Burian determined, without regard to Germany’s opposition, to have an appeal sent out to all the combatant States for the opening of peace negotiations. President Wilson answered, however, after a few days’ interval, that he had repeatedly and in the plainest terms made known the conditions on which he was prepared to consider the conclusion of peace; hence the Government of the United States could not and would not accept a proposal for the holding of a conference concerning a matter in which it had already clearly made known its attitude and aims. And the Cabinets of Paris and London were equally cold. The sole result of Burian’s new effort for peace was the increase of the Entente’s hopes of victory. On Sept. 15 ensued a violent attack against the Bulgarian army, in the ranks of which war-weariness had for long been deepening. The Bulgarian troops offered but little resistance; great bodies of them laid down their arms, and returned to their homes. The Sofia Government, at the head of which Malinov, who was friendly to the Entente, had held for some months the place of Radoslavov, resolved to propose an armistice, which was granted on Sept. 29 under conditions which signified for the Central Powers the loss of the Balkans. King Ferdinand abdicated. These events, and the great successes of the English troops in Palestine, produced their effect upon Turkey. At the beginning of October the Turks gave up the contest, and there was a new period of negotiation, during which the way was opened here too for a separate peace. An armistice was concluded between Turkey and the Entente on Oct. 31 1918, which brought the Dardanelles and the Bosporus under their power, and pledged the Turks to break off all relations with the Central Powers.

Meanwhile the catastrophe had taken place in Austria-Hungary as well. Encouraged by the repeated pronouncements of President Wilson as to the right of nations to self-determination, the separatist ideas of those peoples of the monarchy which did not acknowledge German or Hungarian nationality became more and more assertive. There were disturbances in various parts of the monarchy, and these disruptive influences made it month by month increasingly difficult to keep the army efficient for war. Both Austria-Hungary and Germany now decided to address to President Wilson the offer of an armistice, to be followed by negotiations for peace. To this offer the President at first made no reply; and thereupon the Emperor Charles, in order to save the dynasty, issued on Oct. 16 a manifesto in which he proclaimed that Austria, in accordance with the will of her peoples, was to be erected into a constitutional state, and that the territories occupied by it were union of the Austrian Poles with an independent Polish State not was to be anticipated by this. The imperial manifesto was only to apply to Austria. For Hungary, where they were already working for a personal union and for a complete separation from Austria, the manifesto laid stress upon the integrity of the Hungarian kingdom. It thus became clear to the Southern Slavs that they must no longer hope for a realisation of their national aspirations within the bounds of the monarchy. But the Emperor Charles’s expectation of conciliating the opinion of the Austrian Slavs by means of the manifesto met with no success. President Wilson, too, rejected the Vienna Cabinet’s peace offer. He declared
the Government of the United States had already recognized Czechoslovakia as a belligerent Power and the Czechoslovak National Council as a belligerent Government, as well as the justice of the national aspirations of the Southern Slavs. It was, therefore, for these peoples themselves to decide which of the resolutions of the Austrian Government were acceptable to them. Upon this the request for an armistice made by the Emperor Charles at the beginning of October was declared to be no longer in force. During October independent national representative bodies assembled in Prague, Agram, Laibach and Vienna. The Emperor's dominions thus dissolved and slipped from his grasp. These internal movements led to the disintegration of the armies, which up to this moment had fought bravely. The Governments of the several countries constituting the monarchy, Hungary leading the way, summoned their co-nationals to the defence of their particular frontiers or called them back home. The Emperor Charles tried to save what still could be saved. He was prepared to conclude a separate peace with the enemy on terms which would make possible the continuance of the old monarchy, even though with diminished territory and as a loose aggregation of separate territorial groups under the dynasty of Habsburg-Lorraine.

On Oct. 24 Count Julius Andrassy succeeded Burian as Foreign Minister, in order to begin negotiations for a separate peace. Three days later the office of minister-president was given to Heinrich Lammasch, a well-known pacifist. On the same-day renewed proposals for an armistice were made to President Wilson, and the peace pourparlers, which had never been entirely interrupted, were resumed in Switzerland with representatives of the Entente by various emissaries of the Habsburg Monarchy. Once more, however, they reached no result. At the end of October, after the revolution in Hungary (see Hungary: History), and when increasing numbers of the troops fighting in Italy had started homewards, the Austrian-Hungarian army command asked for an armistice from the Italians, who were victoriously advancing against the demoralized and dissolving Austro-Hungarian forces. This was granted on Nov. 3 1918 on conditions of pitiless severity. Austria-Hungary had to reduce her army at once to a peace footing—only 30 divisions were excepted; to evacuate all enemy territories still occupied by her troops; to surrender to the enemy large portions of Austrian territory, and to hand over all war material actually in these territories, as well as the whole of her fleet. By this means all resistance was made impossible even after the expiry of the armistice. Utterly defenceless, the Emperor Charles had to place his own fate and that of the ancient monarchy in the hands of the victors. The latter also demanded free passage for their armies over all roads, railways and waterways of the monarchy. Germany's resistance was thus to be broken by new dangers threatening her from the south. It was only under protest, and bowing to necessity, that the Emperor Charles gave his consent to these demands, which promised to be fatal to his ally. The negotiations for a separate peace were indeed even now still carried on by the diplomats who remained true to the dynasty, but they hardly met with a hearing from the Entente Powers.

This process of dissolution ran its course in the old monarchy. On Nov. 11 1918 the Emperor Charles renounced all share in the business of government in Austria; the Lammasch Government retired. The Emperor Charles did not, however, renounce his crown. On the following day, in the Austrian National Assembly, a republic was proclaimed (see Austria, Republic), which was at first intended to form a component part of the new German Republic. On Nov. 16 the republican form of government was introduced in Hungary. The ancient Austro-Hungarian Monarchy had thereby ceased to exist, and its role as a European Great Power was at an end.

Bibliography.—Up to 1921 no comprehensive critical account had been published of Austro-Hungarian foreign policy in 1910-8. The Foreign Policy of Austria-Hungary (1920), No. 1, of the hands books prepared under the direction of the Historical Section of the British Foreign Office, is a summary survey. The period 1875 to 1890 is covered in extensive and copious extract from the numerous, La Politique extérieure de l'Austro-Hongrie (2 vols., 1918). The foreign policy of the monarchy is discussed in its connexion with the policies of foreign countries, in Geschichte der Weltpolitik (Debijeau, Histoire diplomatique de l'Europe, vol. ii, 1918); Ernst Reuter, Geschichte der Weltkriege: die österreichische Diplomatie, vols. i. and ii. (1919); Julius Friedjung, Geschichte des Weltkrieges (1919); Julius Hashagen, Umrissse der Weltpolitik, vol. ii. (2nd ed. 1919); Gottlob Engelhal, Geschichte der Weltpolitik, vol. ii. (1918); Pauline Burkhalter, Entwicklung der Zeitalter des Imperialismus, vol. ii. (1922). Friedrich Wiessner, Der Krieges Ende (1919), and F. Kleinwächter's book, Der Untergang Oesterreich-Ungarns, throw more light on the internal circumstances of the Habsburg Monarchy, which also contain interesting discussions of foreign policy. Meissner's Politische Chronik der Oesterreich-Ungarischen Monarchie (1910-8) and Schulthe's Aus der Regierungshistorie der Habsburger Monarchie (1912-16) contain the proceedings of the delegations and the Austrian and Hungarian parliaments and other important documents and speeches. Of the official publications of the Ministry for Foreign Affairs should be mentioned: Diplomatische Aktenstücke betreffend die Ereignisse am Balkan, 3 vols. 1912-1913 (Vienna 1914); Diplomatische Aktenstücke betreffend die Beziehungen der Oesterreich-Ungarns zu Italien und der Italienischen Zeit von 1922. Juli 1914 bis 27. August 1916 (Vienna 1916); Diplomatische Aktenstücke zur Vorgeschichte des Krieges 1914; Diplomatische Aktenstücke betreffend die Vorgeschichte des Krieges: Entscheidungen, Verhandlungen und Diplomatische Aktenstücke betreffend die Vorgeschichte des Krieges Entscheidungen, Verhandlungen und der Entstehung der Triple Alliance treaties (English trans. by A. C. Coolidge, 1920). Valuable information as to Austro-Hungarian foreign policy may be found in the memoirs of German and Austrian-Hungarian statesmen and military commanders; these appeared since the end of the war. Among these may be especially indicated: G. Jagow, Ursachen und Ausbruch des Weltkrieges (1919); Paul von Hildenburg, Aus meinem Leben (1920); Theodor von Bethmann Hollweg, Betrachtungen zum Weltkrieg (1919); Erich Ludendorff, Kriegserinnerungen (1919); Urkunden der Obersten Heeresleitung über ihre Tätigkeit 1905-1915 (1920); v. Treptow, Erinnerungen (1910); Karl Kajetan, Ein Jahr in der Reichskanzlei (1919); v. Cranon, Unser Oesterreich-Ungarischer Bundigsinne im Weltkrieg (1920); Ottokar Czernin, Im Weltkriege (1919); Julius Andrassy, Die tätigkeit des Weltkriege (1919); J. V. Szyllas, Der Untergang der Donaumonarchie (1921). Separate problems of Austro-Hungarian foreign policy are treated among other works by Leopold Chlumsky, Geschichte der Transdanubien (1917); Paul von Hildenburg, Geschichte des Dreibundes (1917); Severus, Zehn Monate italienischer Neutralität (1915); Th. v. Somosny, Die Balkanpolitik zwischen Ungarn und Italien (1917); B. Reicke, Die Entwicklung der Habsburger Monarchie (1912); Berthold Molden, Altes Graf Aehrenthal: Sechs Jahre äusserer Politik Oesterreich-Ungarns (1917). (A. F. P.)
and Central Styria were cut off; the two great natural triangular routes, that of German Tirol and that within Austria, and hence also the southern longitudinal railway of the Eastern Alps (Franzensfeste-Marburg) were split up between different states (see Carinthia, Styria, Tirol).

Population.—The territories under Austrian administration in May 1920, which alone could be included in the census of Jan. 31 1920, embraced a portion of Lower Austria belonging to Czechoslovakia; on the other hand, electoral district No. I. of Carinthia and a few communes of Styria were occupied by the Southern Slavs, and the disputed Burgenland (German Western Hungary) by Hungary. With these reservations the figures in the appended table hold good.

* Approximate.

The territories under the war and the shortage of foodstuffs in all countries from 1910-20, the populations of Upper Austria and Tirol decreased greatly during that period (the average decrease was 3.6%). In Vienna, the birth-rate had slightly increased, but in 1921 was still lower than the death-rate. In 1910, the proportion of males and females was 1,000 to 1,024; in 1920 as 1,000 to 1,089. The nationalities of the inhabitants are not shown in the census of 1920; only the Czechs in Vienna and the Slovenes in Carinthia form important minorities. The population of the mountainous districts is sparse; only Lower Austria, thanks to Vienna, shows a dense population. Excluding Vienna it would show only 194 inhabitants per sq. m. In the area covered by the census of 1920, 30.9% of the population was in 3,551 communal districts having up to 2,000 inhabitants; 14.1% in 295 such districts having 2,001 to 5,000 inhabitants; 4.8% in 41 districts of 5,001 to 10,000 inhabitants; 2.8% in 13 districts of 10,001 to 20,000 inhabitants; 3.0% in seven districts of 20,001 to 50,000 inhabitants, and 2.5% in two districts of 50,001 to 100,000 inhabitants; 3.9% were, however, in two districts of over 100,000 inhabitants (Vienna and Graz). In 1910 94.12% of the population was Roman Catholic, 2.6% Evangelical, 2.98% Jewish, other faiths 0.3%.

Education.—At the end of 1918 there were 4,102 free public primary schools (Vollkreish), with 17,497 teachers and 788,941 pupils; 331 higher elementary middle-class schools (Bürgerschulen), with 3,410 teachers and 82,739 pupils; 362 private lower elementary schools with 35,511 pupils; and 63 private higher elementary schools with 4,014 pupils; 1,875 teachers served 3,431 private schools. In 1910 the average proportion of persons over 10 years of age who could both read and write was 93.70% (in Vorarlberg 99.12% in Carinthia 98.45%); 0.0% (in Carinthia 2.28%) could only read and 0.5% could neither read nor write. At the end of 1918 there were 37 institutions for training teachers—15 for men and 22 for women. In addition to the elementary schools there are groups of higher schools; intermediate schools, professional and technical schools, and "high" schools. There are also higher and lower schools for forestry and agriculture. In 1917-8, 45 of the intermediate schools (Mittelschulen) were Gymnasien (classical schools), 26 Realgymnasien (Realschulen), etc. (in which Latin is taught); 39 Realgymnasien (modern, without Latin) and 26 Mädchenschulen (girls' schools) with, together, 3,135 teachers and 40,147 pupils. Of the girls' colleges, one ranked as an "ordinary" one, and the rest as Realgymnasien. But girls are required to attend the other intermediate schools; the number of girls' colleges is diminishing. The churches have charge of religious instruction in the elementary and intermediate schools. In 1917-8 there were 9 higher and 32 secondary commercial schools, 19 higher technical schools and 53 special technical schools; and 3 intermediate and 38 lower agricultural and forestry schools. The higher educational establishments are: Three universities (Vienna, Graz and Innsbruck), each with four faculties—Catholic theological, law and political sciences, medicine, and philosophy; two technical colleges (Vienna and Graz) in the Evangelical theological faculty in Vienna, and that of Catholic theology in Salzburg. There are also in Vienna the high schools of commerce, agriculture and veterinary science, the consular academy, the academy of plastic arts, the special school for medal and stamp engraving, the academy of music and graphic arts, and at Leoben the college of mining.

Agriculture and Forestry.—In the returns according to occupations not taken in 1910, it appeared that 49.14% of the population was engaged in agriculture and forestry, 14.81% in manufacturing, 17.40% in trade, and 7.65% in other occupations. Not taking Vienna into account, 50.36% was engaged in agriculture and forestry. In 1910 10.4% of the land was unproductive (in Tirol 23.7% in Lower Austria 87.5%).

Of the productive areas, 25.6% was arable (in Lower Austria 42.2% and in Vorarlberg 3.4%); 1.7% gardens and vineyards (in Lower Austria 3.5% and in Vorarlberg 7.6%); 12.4% meadows (in Upper Austria 20.1% and in Tirol 7.4%); 17.8% grazing-lands (Vorarlberg 51.3% and Upper Austria 2.7%); 42.5% forest (Styria 53.4% and Vorarlberg 29.6%). The high Alpine lands of Vorarlberg, Tirol and Salzburg are characterized by the smallness of their total
cultivated area and their large expanse of pasture, and the country of the Danube valley by its large area of arable and small amount of meadow-land. The territories of Styria and Carinthia have an intermediate character, being mostly the home of rye, oats, barley, potatoes, maize, pulse, turnips and flax; but the supply falls far short of the demand. In 1913 3.5% of the arable land lay fallow, and in 1918 no less than 17.5% of the land was uncultivated. The wheat belt has attained an importance in Lower Austria only. The timber output, on the other hand, is very important, the forests in 1910 covering 11,012 sq. m., of which 8,576 were covered with pine forest and 926 with deciduous ones. Sulfur mining is important in many districts but in 1921 by no means met demands. Excellent breeds of cattle are reared in Vorarlberg (Montafon breed), Tirol (Tuxertal, Pustertal, etc.) and Lower Austria (Mietendorf in Carinthia). In 1918 there were 1,381,883 head of cattle (of which 901,894 were milk-cows) and 1,269,875 swine. Good breeds of horses are raised, especially in Salzburg (Pfinzau breed), but the total number scarcely reached 200,000. There were some 300,000 sheep and a slightly smaller number of goats. Poultry abounds (some six million head in 1918). Bee-culture thrives in Carinthia and Styria in combination with the cultivation of buckwheat and lentils. The mining output of 1915 included some 75,000 tons of coal (almost all from Lower Austria), 2.4 million tons of brown coal (1.8 from Styria), 1.8 million tons of iron ore (almost all from Styria); some 15,000 tons of lead ore (almost all from Carinthia), 14,000 tons of graphite (almost all from Carinthia), considerable quantities of magnesite (from Styria and Lower Austria), some sulphur and ores of zinc, and lead. The output of graphite was 160,000 tons; of which 100,000 tons were produced in Upper Austria, the remainder in Styria, Salzburg and Tirol. Natural gas is obtained at Wels in Upper Austria. Important minerals are:—The iron mines in the Styrian Erzberg (Eisenzer and Vorderberg) and those of Hüttenberg in Carinthia; the copper mines of Mitterberg in Salzburg; the lead mines of Bleiberg in Carinthia; and the brown-coal mines of Kölflach and Voitsberg, Wies and Elbsalz, Fohnsdorf and Leoben, in Styria, Wolfsberg in Upper Austria. The salt mines have already been mentioned. The smelting industries produced 300,000 tons of pig iron in Upper Austria (Steyr) and 60,000 tons of copper (in Salzburg), about 8,000 tons of lead (in Carinthia), besides copper sulphate, mineral colours, a little silver and a very little gold. The output decreased after 1915 but was re-established in 1921. With the exception of iron ore and magnesite, the minerals do not suffice to meet the needs of Austria herself; she can only supply one-seventh of the coal she requires.

Manufactures.—The industries of Vienna are very varied. Industrial areas of the first rank are:—Lower Austria, Vorarlberg and Upper Styria; next to them come Upper Austria and Middle Styria. The largest iron works are in Styria (Eisenberg, Vorderberg, Hit- flach) and in Lower Austria (Waidhofen an der Ybbs); in Upper Austria (Linz, Wels). There are also machine factories in the above territories, especially in the neighbourhood of Lower Austria, and in the Upper Styrian areas, especially in the district of Steyrburg, where the automobiles in Vienna and Graz; bicycles at Steyr and Graz; river boats at Linz. Lower Austria (Bendorf and elsewhere) is noted for the manufacture of base metal goods. Carinthia produces leaden articles. The cotton and woollen industries are important, especially in the Vienna district, Vorarlberg and near Linz and Graz. Important, also, are the jute industries of Lower Austria. The manufactures of machine-made knit goods in Vorarlberg, the coarse-knit woolen cloth made in Tirol and Vorarlberg; clothing, silk goods and articles of luxury of all kinds are made in Vienna, hairs in Linz and Graz is also the manufacture of the glass and porcelain furniture. The wool, cellulose, pasteboard, paper and paper goods industries of Lower Austria, Styria and Upper Austria are very important. Leather and leather goods are chiefly produced in Lower Austria, shoes and gloves in Vienna. The Vienna district and the foot-hills of the Alps are flour-milling centres, while distilling and malting are chiefly carried out in Vienna. The chemical industries in Vienna and its neighbourhood are also extensive. The metal-working industries are also rather important. Vienna is the chief centre of printing and the graphic arts, and of artistic trades generally.

The manufacture of tobacco is a State monopoly (there are factories in Vienna, Hainburg, Fürstenfeld and other places). (R. St.)

Constitution and Administration

The collapse of the Austrian Empire in the autumn of 1918 was an event which all nationalities living within its frontiers anticipated. They were thus prepared, sooner or later, to set themselves up as independent states. Serious resistance was not to be expected, as the military débâcle had been so complete as to prevent any possibility of stopping the process of disintegration. A premonitory symptom had been the Imperial Manifesto of Oct. 16 1918, in which the Emperor Charles announced his resolve, in accordance with the wish of his peoples, to transform Austria into a Federal State in which every nationality was to form a separate state-entity within its own ethnographical limits. Not many years previously such a manifesto might have initiated a happy development by which the World War could have been ended and Austria and her Allies and subjects perhaps be restored without the least resistance being encountered, though it was not till Nov. 11 that the Emperor Charles issued a proclamation, countersigned by his last prime minister, Lammach, in which he declared himself ready to acknowledge beforehand whatever decision German-Austria might come to concerning her future constitution, and renounced all share in affairs of State. The revolution out of which the new German-Austria emerged was thus not only bloodless, but was carried through without any open struggle. It was, none the less, a revolution; for the constitution of German-Austria was not evolved by any legal process out of the constitution of old Austria but between the two lies the break in the continuity of constitutional practice, and it is for this reason that German-Austria cannot, any more than Czechoslovakia, be looked upon as identical with the old Austria.

The Provisional Constitution.—The first provisional constitution of German-Austria, created by the resolution of Oct. 30 1918 and supplemented by several later laws (above all, that of Nov. 14 1918 on the taking-over of State authority in the Territories, and that of Nov. 19 1918), exhibits an extreme type of democratic constitution. The supreme power in the State, executive as well as legislative, was consigned to the Provisional National Assembly. It exercised its legislative power directly through its enactments. Its executive power, however, was exercised through a Council of State (Staatsrat) elected from among its members, the three parliamentary parties—Christian Socialists, Social Democrats and German Nationalists—being proportionally represented. The Council of State thus formed a parliamentary committee which functioned as a sort of head of the State.

In contradistinction to the old Austrian Reichsrat, with its Upper and Lower House, the first legislative body of German-Austria was organized on the single-chamber system. Each of the three parties elected a president to act as speaker of the parliament. These three presidents were coequal and occupied the chair week by week in an agreed rotation.

The legislative power of the Provisional National Assembly was restricted, in that legislation on certain matters, which under the old system appertained to the autonomy of the so-called Crown Territories (Kronländer) of the Austrian Empire, was reserved for the Provisional Territorial Assemblies, which had taken the place of the former Territorial Diet (Landtag), in which the functions of self-government had been vested. For these, under the style of “Territories” (Länder), remained within their old frontiers—though, of course, only to the extent in which they formed part of the new State: viz. Lower and Upper Austria, Salzburg and Vorarlberg, in their entirety; Styria and Carinthia, with the exception of areas inhabited by Yugoslavs; Tirol, without its southern part mainly inhabited by Italians. Out of the former "crown lands," Bohemia,
AUSTRIA, REPUBLIC OF

Moravia and Silesia, which were inhabited by about 3½ million Germans, two new Territories were carved: German-Bohemia and Sudetenland, each with a Provisional Territorial Assembly. In actual practice, however, the executive power of German-Austria could not extend to these Territories, as they were held by the Czechoslovak State, to which they were eventually assimilated. As the revolutionary constitution of the Territorial Assemblies and of the Territories themselves took place at the same time as that of the National Assembly and of the State, but independently, the limits between Territorial legislation and State legislation were not clearly defined from the very outset. The Territories became the centres of a movement in favour of an extreme form of federalism, and this led to the constitution of Austria being ultimately that of a Federal State.

State law required essentially only a resolution of the National Assembly, which had to be registered and attested by the Council of State and published in the Government law gazette. The Council of State had a suspensive veto on legislation, but this was overridden by the simple passage of a measure a second time through the National Assembly, a bill then passed at once becoming law. According to the constitution a Territorial law to be valid required not only to be passed by the Territorial Diet but to receive the assent of the Council of State, which, in this as in other respects, had taken the place occupied by the Emperor under the old Austrian constitution. In view of the actual power of the Territories, however, the Council of State was unable to assert its right of veto.

Apart from the 20 delegates, and an equal number of substitutes, elected as already described, the Council of State included the three presidents of the National Assembly, who presided over it in rotation. Though the Council, thus constituted, was the supreme organ of parliamentary Government, it did not itself carry on the administration directly, but through a Cabinet, nominated by it, consisting of so-called secretaries of State, who acted as heads of departments. The Cabinet was also to be presided over by the presidents of the National Assembly in rotation, and it was only in the absence of these that the State Chancellor, whose functions were in fact those of minister-president, took the chair. The Cabinet was subject to the principle of ministerial responsibility, which could be enforced in the special court for dealing with infringements of the laws and constitution (Staatsgerichtshof), the functions of which had originally been transferred to a parliamentary committee of twenty.

The whole machinery of administration was taken over from the old Austria almost without a change. Only in the case of the so-called intermediate link, the administrations of the Territories and the State was there any drastic reform. Each one of the so-called "Crown Territories" (Kronländer), of which the Austrian monarchy was composed, constituted the area of an intermediate administration, at the head of which was a governor or lieutenant (Statthalter) nominated by the Emperor and subordinate to the central Government. Side by side with this, however, the Territories existed as autonomous bodies politic, with an administrative system of their own in all matters not falling within the province of the central administration. This autonomous administration was exercised by the Territorial Diet (Landtag) through a Territorial Committee (Landesaus- schuss) elected from among its members and presided over by the president of the Diet, who was nominated by the Emperor.

This parallelism of the autonomous and State administrations in the Territories, with the rivalry between them, had been one of the worst evils of the old monarchy; it was done away with under the provisional constitution of German-Austria by the simultaneous democratization of the intermediate administrative system. The whole administration in the Territories was declared to be a State concern; the autonomous and State administrative organizations were amalgamated and subordinated to a Territorial Government, consisting of the head of the Territory (Landeshauptmann) and several substitutes elected by the Territorial Assembly from among its own members. This Territorial Government was subordinated to the central State Government in all matters of Territorial administration, but there were no legal provisions for making this subordination effective. The central State Government could not depose a Territorial Government, nor could it in any way call it to account for disobedience; it was, in short, wholly dependent on the goodwill of the Territorial Government, which, since it was elected by the Territorial Diet, felt itself politically responsible to this alone. This led to a very serious loosening, almost indeed to the complete dissolution, of the administrative system of the State, and was one of the factors which ultimately led to the adoption of the Federal constitution.

As regards the organization of justice and the relations of the citizen to the State, the new provisional constitution confined itself to adopting, more or less unaltered, the respective rules of the old Austrian constitution. In the same way all the remaining private and public laws of the monarchy, so far as they were inconsistent with the new constitution, was expressly taken over under an article of the provisional constitution, and thus, formally at least, given a fresh validity.

The main task of the Provisional National Assembly, in addition to the creation of a provisional constitution, was to prepare the way for the Constituent Assembly, for which the framing of a definitive constitution was reserved. According to the electoral law passed by the Provisional Assembly, the Constituent Assembly was to consist of 225 members, who were to be elected in 13 assemblies, the basis of which was equal, secret and personal suffrage for all citizens over 20 years of age, without distinction of sex, and on the system of proportional representation. Actually, however, only 170 members were returned, as no elections could be held in the territories occupied by Czechoslovakia, Italy and Yugoslavia. Of the 170 deputies, 72 were Social Democrats, 69 Christian Socialists, 26 German Nationalists, the three remaining being a Bourgeois-Democrat, a Czechoslovak, and a Jewish Nationalist (the two latter having supporters in Vienna only).

The Constituent Assembly. The Constituent National Assembly met at Vienna on March 4, 1919. Before settling the definitive constitution it made one or two not unimportant modifications in the provisional constitution (laws of March 4 on Popular Representation and the State Government). Above all, the relation between State and Territorial legislation was regulated. In the first place it was decided that all legislative acts of the Territorial Diets were to be submitted to the central State Government, to which was assigned the power of suspensive veto and, in the event of such acts being contrary to the constitution, the right to challenge them before the court established to try constitutional cases (Verfassungsgerichtshof). Acts by the Territorial Diet needing the cooperation of the central Government for their execution were made subject to the endorsement of the latter. Drastic alterations were made in the organization of the executive power. The Council of State, with its directory, was abolished, and its governmental and executive powers transferred to the Cabinet, which was henceforth to be directly elected by the National Assembly. The election of the Cabinet was entrusted to the Principal Committee (Hauptausschuss), itself elected from the body of the Parliament, the three chief parties being proportionally represented. This Committee, through which Parliament exercised a decisive influence over the executive and without whose consent no important act of Government could be undertaken, to a certain extent took the place of the Council of State, but, unlike this, without any public appearance of functioning as the head of the State. These functions—representation of the State in its relation with foreign Powers, more especially the ratification of treaties, the nomination of officials, the right of pardon, etc.—were entrusted to the president of the National Assembly; so that in this way, too, the character of parliamentary Government found outward expression.

The conclusion of the Treaty of St. Germain compelled a further alteration of the constitution of German-Austria. By
the law of Oct. 1 1919 (on the form of the State) the frontiers of the State were legally defined in accordance with the provisions of the treaty, i.e. the Territories assigned to the other "succession states" were cut off. In these Territories there lived, in a solid group, nearly half as many Germans as the treaty had left to German-Austria, now badly divided by the frontiers of the State, which had hitherto been German-Austria (Deutschösterreich), was legally altered to "the Republic of Austria" (Republik Oesterreich), for it was only under this name that German-Austria could obtain international recognition. The sentence "German-Austria is a constituent part of the German Reich," which had hitherto been embodied in the constitution but had represented an aspiration rather than a fact, was now excised, in accordance with Art. 88 of the Treaty of St. Germain, which decreed the independence of German-Austria.

Of the remaining provisions of the treaty affecting the constitution of German-Austria, attention need only be called to those dealing with the protection of minorities, which did not, however, add anything essential to the safeguards for nationality and creed secured by the old Austrian fundamental law of Dec. 21 1867 on the general rights of citizens of the State, which had been adopted in the German-Austrian constitution.

The Federal Constitution.—It was only under the greatest possible political difficulties that the Constituent Assembly could be brought to fulfill its proper function, that of framing a definitive constitution. From the very first the Federal character of this constitution was above all determined by the fact that there was the only possible way of overcoming the ever-increasing tension between the Territories and the State as a whole. Moreover, the provisional constitution had already contained certain Federal elements, and these had now to be developed in order to give the Territories, constitutionally as well as in fact, the position which they claimed.

From the point of view of technical organization a Federal State may exhibit one of two types of character. In one the legislative and executive power may be divided between a central legislature and executive, whose activity constitutionally covers the whole State, and a number of autonomous legislatures and executives, with jurisdiction over territorial subdivisions of the State, which are known as subordinate states. In the other, the legislatures and executives of the subordinate states may share the legislative and executive powers of the organs of the central State. The first of these types was already exhibited in the provisional constitution of German-Austria. To make the constitution of the Federal State complete, the Austrian Republic really only needed to give the subordinate states, i.e. the so-called Territories (Liinder), a share in the legislative and executive powers of the central organs of the federation or superstate, in order to close off the only possible way of overcoming the ever-increasing tension between the Territories and the State as a whole. The Territories being completely excluded. In the case of the second group, the Federation alone has the power to make laws, but their execution is the affair of the Territories. In the case of the third group, the Federation has the power of legislation in so far as it may lay down general principles, but it is for the Territories to give these principles practical effect in laws and to see to their execution. All matters which do not fall within the realm of one of these groups constitute the fourth group, which is wholly within the legislative and executive province of the Territories.

The legislative organ of the Federation is the National Council (Nationalrat), of which the composition is the same as that of the National Assembly under the provisional constitution, and the Federal Council (Bundesrat). In the Federal Council the individual Territories are represented in proportion to the number of inhabitants primarily domiciled in them, a principle differing from that of Switzerland and the United States, where, in the Staatenhaus and Senate respectively, the subordinate states have an equal voice whatever their size, but approximating to the constitution of the German Reich, under which the subordinate states were from the first represented in the Reichsrat. As the Frankish, according to the constitution, however, the representation of the Territories in the Bundesrat is by no means strictly proportional. The largest Territory sends 12 representatives, the rest in proportion to the number of their citizens; but no Territory sends less than three representatives, although the three smallest Territories—Tyrol, Salzburg, and Carinthia—would not be entitled to so many were the principle of proportional representation strictly carried out. In order to correct the disproportion between Lower Austria, with its population of some 3,000,000, and the smaller Territories, whose population does not exceed 140,000 and 400,000, the Territory of Lower Austria was divided into two parts—the Federal capital, Vienna, and the Territory of Lower Austria. Vienna, with its 1,800,000 inhabitants, is the largest subordinate state.

As the Federal Council is fundamentally concerned only with legislation, and only in very exceptional cases with executive affairs, its members are elected by the Governments of the Territories but by the legislative bodies, which are again styled Landtag (Teritorrial Diets), and they are elected on the system of proportional representation. As a legislative organ the Federal Council is in no way placed on an equality with the National Council; it has a suspensive veto, but if the National Council again passes a bill thus vetoed, it becomes law ipso facto. A further alteration of the legislative machinery established by the provisional constitution was the introduction of the constitutional referendum and of the right of popular initiative. The executive power of the Federation is exercised by the Federal Government, whose members are called Federal ministers and meet under the presidency of the Federal chancellor or vice-chancellor; they are assisted in their several departments by secretaries of State. The Cabinet is composed in the same way as under the provisional constitution—election by the National Council on the recommendation of the Principal Committee. An important alteration in the provisional constitution was that the executive functions hitherto assigned to the president of the National Assembly were transferred to a special head of the Federation, the Federal chancellor or vice-chancellor. The Federal chancellor and the National Council meet in joint session under the name of Federal Assembly. To this Federal Assembly the president is responsible.

The executive powers of the Federation are exercised in the Territories by Federal organs subordinate to the Federal Government, or, as a general rule, by the organs of the Territorial Government in the sphere of activity devolved upon them. In the latter case the Territories function as organs of the Federation and are subordinate to it. For this reason the Federation is interested in the constitutions of the Territories, and the Federal constitution prescribes for them, far-reaching provisions as to the organization of the Territories, and it is only within the limits of these provisions that the Territories are free to settle their own constitutions. So far as their legislatures are concerned, the Federal constitution prescribes the single-chamber system for the Diets, as now established, and the election on the same basis as the National Council. The Territorial Government is to be elected by the Diet, and is to consist of the Landeshauptmann and a number of other members. In respect of the sphere of Federal activity assigned to the Territories and to the Federal Government, the Territorial Government is to be seen, i.e. those in which the Territories act as the organs of this Government—it is the Landeshauptmann and his subordinates.
The weightiest influence of the Federal constitution is exercised through the special courts of law established under it to decide cases of alleged violation of the constitution in matters of administration or legislation. Anyone whose rights have been violated by an illegal decision or act of the Federal or Territorial authorities, and who has failed to obtain redress through the ordinary administrative channels, can appeal to the Court for the trial of administrative cases (Verwaltungsgerichtshof). This Court has power to pronounce on the legality of such decisions or acts, and in certain circumstances to amend them. The members of the court, like all the Federal organs, are nominated by the president on the recommendation of the Federal government, but this recommendation needs, in respect of half the members, the consent of the Principal Committee of the National Council and, in respect of the other half, that of the Federal Council.

The second court administering public law is the Constitutional Court (Verfassungsgerichtshof). Of this the president and vice-president, as well as half the members, are elected by the National Council, the other half by the Federal Council. Its primary function is to decide disputes between authorities as to their competence. As the Court it furthermore hears charges brought by the National Council against Federal ministers, by the Federal Assembly against the Federal president, by the Diets against members of the Territorial Governments. As a Court of ordinance (Verordnungsgerichtshof) it judges cases of illegal decrees appealed at the instance of the Federal courts or of those of the Territories. Lastly, as a constitutional court in the narrowest sense, it decides, at the instance of the Federal or the Territorial Governments, whether Federal or Territorial laws are or are not constitutional. It has the right to quash an illegal decree or an unconstitutional law. The Constitutional Court acts also as the central court for hearing petitions against illegal ordinances and to all bodies elected by the general vote. It also judges in cases of violation of international law.

The law of the Federal constitution of Oct. 1 1920 did not complete the new structure of the Austrian constitution. Several special laws were still needed, aiming more especially at the reform of the administration both in the Federation and in the Territories. It was hoped that, in the spirit of democratic self-government, this administrative reform would follow the lines of local government in England.

 Authorities.—See Kelsen, Die Verfassungsgesetz der Republik Österreich (1919), and Die Verfassung Deutschösterreichs (Jahrbuch des öffentlichen Rechts, vol. 9, 1920); Merkl, Die Verfassung der Republik Deutschösterreich (Zeitschrift für öffentliches Recht, vols. 1 and 2, 1920).

Finance and Banking.—When in the last days of Oct. 1918 the various parts of the Austro-Hungarian monarchy constituted themselves on one side independent states (the Austrian Republic, the Czechoslovakia Republic, Hungary, and the republic of West-Ukraine), and for the other part decided on joining already established nations (Italy, Rumania, Yugoslavia), or joined territories detached from other states and forming new states (Poland), there existed in all these territories one uniform paper currency in circulation, i.e. the notes of the Austro-Hungarian Bank, enjoying a fixed rate. It was clear that such conditions could not be maintained for any length of time, and that, in view of the connexion between paper money of fixed rate and State finance, it was impossible to continue this unity of currency. All the states concerned, which succeeded the Austro-Hungarian Monarchy, were in such financial straits that they considered the continued recognition of the issue of notes a necessity. The note-printing press, however, was in Vienna, and the Austro-Hungarian Bank was actually under the deciding influence of the new German-Austrian Government. It was urgently necessary for the new states to obtain an independent currency, i.e. to make themselves independent, so far as the printing of notes was concerned, of the Vienna note-printing press. This was comparatively easy for those who had joined already existing states, but more difficult for the newly formed states which were obliged in the first instance to create a new currency. The coinage of each state was undertaken by the moment of the dissolution of the Austro-Hungarian Monarchy, was merely a technical problem of printing, and the question how to obtain printing-plates, banknote-paper and printing-ink appeared for the moment the most important points of currency policy. After the Italian Government as early as Nov. 1918 and the Rumanian Government in Feb. 1919 had made the necessary preparations to substitute respectively the lira and the lei for the Austro-Hungarian "krone," in the territories occupied by them, the Government of the Serbo-Croatian-Slovenian State proceeded in Jan. 1919 to mark the Austro-Hungarian notes circulating within their territory by stamping them. On Feb. 25, 1919 the Czechoslovakian Government followed suit by stamping the kronen notes circulating in their country. Then the Austrian Government could not remain idle. It could not wait until all the other states had passed from the Austro-Hungarian krone to a national krone. It had to get rid of the Austro-Hungarian krone, in order to avoid the danger of such notes as for one reason or another had not been stamped by the other states returning to German-Austria and there increasing the inflation. The kronen notes circulating in German-Austria were therefore also specially marked, and, by a resolution of March 25 1919 having the force of law, it was decreed that all notes not so marked would not be legal tender within the German-Austrian State.

A decree of Feb. 27 1919 had ordered the stamping over of all notes of the Austro-Hungarian Bank circulating within the territory of the German-Austrian Republic, with the exception of the notes for one and two kronen (which also subsequently were ordered to be stamped). With the execution of this regulation the German-Austrian currency was separated from that of the other "succession states," and there was only one special kronen note, which was stamped as recognized legal tender for Austria.

The German-Austrian Republic also used the note-printing press as its chief expedient for covering the national expenses. At the time of the carrying-out of the stamping process, at the end of June 1919, the stamped German-Austrian notes in circulation amounted to 7-6 milliards of kronen; at the end of 1920 the circulation had risen to 30 milliards. In consequence there was a further depreciation in the exchange. On Dec. 31 1920 the dollar was quoted in Vienna at 668 kronen, as compared to 5 kronen in pre-war times.

The republic of Austria at first not only maintained the system of restricted exchange operations, introduced under the Empire during the war, but even made it more severe. Only in the summer of 1920 was any relaxation permitted, in so far as the forced release of foreign currencies obtained for goods exported was generally cancelled. In Nov. 1920 further modifications were made, so that by the end of 1920 the only restriction of money transactions with foreign countries remaining in force was the prohibition to import or export kronen notes. The regular exchange operations on the Vienna Bourse were, however, not revived. They were replaced by a system of restricted exchange business under the special supervision of the still existing Devisenzentrale.

The general political conditions and the depreciation of money had led to such an impasse that up to 1921 the whole financial
system of the republic was in a state of uncertainty. On the
one hand, the Austrian State, by the peace treaty of St. Germain,
was made liable toward foreign countries for an amount not
specifically determined. On the other, it was found neces-
sary for political reasons to introduce a system of providing
the population with cheap victuals. As these had to be obtained
almost exclusively against payment in foreign currency abroad,
and it was desired to sell at home at the lowest possible prices,
there resulted a considerable discrepancy between the expenses
necessary for this part of the State budget and the income
derived. At the beginning of 1919 the deficit of the Austrian
budget was estimated at hardly less than 50 milliards of kronen
per annum. To cover this deficit the Austrian State, with the
help of the Allied Powers, contracted loans abroad, and for the
rest relied on the note-printing press. Only a small part of the
expenses of the State could be covered by taxation, notwithstanding
that all direct taxes were greatly increased and a new
direct tax, an extraordinary property tax, was specially intro-
duced in 1920. Of this property tax, the fixing of which required
enormous preparation, it was permitted to make repayments
in Feb., 1920 under specially favourable conditions. Such pre-
payments brought in over 7 milliards of kronen, but more than
half of these prepayments were made in war loan. The situation
of the Austrian State budget was therefore in 1919 a most un-
favourable one. An improvement could only be expected on
the one hand by doing away with the system, which could not
be permanently maintained, of providing necessaries for the
population below cost price at the expense of the State, and on the
other by a radical reform of the many State and municipal enter-
prises (post, telegraph, telephone, State railways, salt-
mines, tobacco manufactories, town railways, illumination and
power works).

L. v. M.

HISTORY

When in Oct. 1918 the break-up of Austria-Hungary became
a matter of common knowledge (see Austrian Empire), the
Germans of Austria also announced their right to self-determi-
ation. The impulse towards this movement came from the left
wing of the Social Democrats who occupied the same standpoint
as the Independent Socialists of the German Reich. They had
long opposed the view that the dissolution of the Halsburg
Monarchy, which was not highly industrialized, and the annes-
taxation to a strongly socialistic Germany of the Austrian territories
with a German population (the Alpine territories, German
Bohemia, and the Sudetic territories), which would thereby be
rendered possible, must necessarily involve a proletarian policy;
and their views now completely gained the upper hand over the
Great Austrian tendencies within the party. The "pro-
visional National Assembly" of German-Austria at its first
session (Oct. 21, 1918) did indeed regard its connexion with the
other national states of the old empire as not yet fully dissolved.
But only nine days later (Oct. 30, 1918) the new State was con-
stituted in the fullest independence of the dynasty and of its
former companion states speaking other languages. The last
impulse towards this radical procedure had been given by
Andrássy's overtures for a separate peace, which were regarded
in wide circles in German-Austria as a betrayal by the Emperor
of the German people, and gave rise to revolutionary demon-
strations in Vienna. Under the influence of subsequent events
in Germany the Emperor Charles was compelled to renounce,
on Nov. 11, 1918, the exercise of governmental functions, and
henceforward to recognize the new form of government the people
might choose. The day after, under pressure from the Social
Democrats, the republic was proclaimed.

In the new free State all three parties—the Christian Socialists,
German National party, and Social Democrats—formally as-
sumed a share of the responsibility of government. Thus from
the outset power had passed almost entirely into the hands of the
Social Democrats. The bourgeois parties acquiesced in all the
more willingly in this, since they were of opinion that only the
Labour party would be able to conjure away the dangers which
threatened from the break-up of the old army and of the old
authorities. The Social Democrats piloted the State skilfully
through the first great vicissitude, though naturally in accord-
ance with their own point of view. Above all, in order to check
any reactionary tendencies, they disbanded all bodies of troops
belonging to the old army on their return from the front, and
placed the newly formed militia (Volkswehr), manned by the
proletarian classes, under the leadership of councils of soldiers
who were voluntarily devoted to them.

But the very first two months of the young republic serious
losses of the territorial possessions which they had claimed on the
basis of the "right of self-determination." The Czechs occupied not only all the Sudetic territories populated by Ger-
mans, but also a few strips of land on the borders of Lower Austria. The Yugoslavs, going beyond the Slovene territories
of Southern Styria, stretched out their hands towards the purely
Austrian towns of Marburg and Radkersburg. The repeated
attacks which they made early in 1919 to gain a footing also in
German portions of Carinthia were repulsed by the inhabitants,
acquainted as they were to war. From the beginning of the
union, the Austrian government had desired the German Minor-
ities within the Austrian territory to be placed under the protec-
tion of the Austrian government, and to be given the same rights as
them. This was the object of the law of March 14, 1919, which
was confirmed in the Treaty of St. Germain.

The "Constituent Assembly" was elected under the influ-
ence of the terrible economic consequences of the war and of
the break-up of the monarchy. The Social Democrats won a "relative"
majority, with 72 seats out of 170. They formed a coalition for purposes of government with the second strongest party, the Christian Socialists, who represented the peasant and lower middle-class elements. At the head of the Cabinet was
the State Chanceller, Dr. Karl Renner, who had already directed
the Government since the revolution. The secretariats of State, which were of more political importance, were likewise
occupied by Social Democrats, who also set the pace in other
departments. Otto Bauer, who was followed in the Ministry
for Foreign Affairs as early as 1918 by Victor Adler, strove
with all his strength for a union of German-Austria with the
German Reich, in which endeavours he was supported by all
but a section of the Christian Socialists. The preliminary
negotiations conducted with Berlin early in 1919 met with a
favourable result. Bauer counted very much in his plans upon
the support of the Italians, to whom the Austrian policy of
liberalism was explained by the Austrians as a step towards
the union between the German AUSTRIA and Italy.

The alarming conditions of Austria came daily more darkly
into view. Famine and misery forced the State straight into the
abyss of serious social shocks. Soldiers and civilians, profession-
als and amateurs, seized at the means of self-protection. The
several Territories (Länder), in all of whose Diets—with the ex-
ception of Lower Austria—Christian Socialist majorities had
been sitting since the elections in the summer of 1919, put up
political and economic barriers against each other, and sealed
themselves off even more hermetically from Vienna. Both in
town and country party organizations of every sort interfered
in administration—generally with the best intentions—and this
resulted not infrequently in attacks on the freedom and property
of their fellow citizens. The State Government was meanwhile
powerless. The elections of March and April 1919, however,
were in all cases brought about by the National Socialists, who
had seceded from the Socialists of the Radical Left during the
days of the revolution. In Vienna, on Easter Thursday and
on June 6, 1919, excesses were committed in consequence of the
plots of native and foreign Communists, which led on both
occasions to loss of life. If more serious consequences were
avoided, this was as much due to the admirable police of Vienna
as to the quiet and reasonable attitude of the Socialists leaders,
who were conscious of their responsibility, and the good temper of the German-Austrian populace. When it became clear that the Communist disturbances were to no small extent fomented by the Hungarian Mission in Austria, dissensions arose between Vienna and Budapest, which were not settled till the Hungarian Soviets replaced their envoy, who had been involved in the affair, by a person more in sympathy. On May 12, 1919 the State Chancellor, Dr. Renner, had gone with a delegation to St. Germain-en-Laye to receive the terms of the dictated peace. With the exception of the Magyars, all the countries formerly under the same Government as the German-Austrians had "associated" themselves with their enemies in the World War. It was in no small degree due to their counsel that the Treaty of Peace turned out to be even more severe than that with Germany. In comparison with the loss of former German territory and of 3,000,000 German-Austrian subjects, combined with unprecedentedly heavy economic burdens and restrictions, the acquisition of the Burgenland (German Western Hungary) and the promise of the Entente to assist in the reconstruction of Austria seemed but poor advantages, the value of which remained to be proved.

Otto Bauer recognized in the provisions of Article 88, which specifically forbade Austria's union with Germany, and in the fact that Italy, in spite of the Italophil attitude of the Vienna Cabinet, annexed German Southern Tirol for good, a complete defeat for his policy; and he resigned. Renner took over in person the charge of foreign affairs. The Treaty of St. Germain was signed on Sept. 20, 1919, and on Oct. 17, 1919, it was approved by the Constituent Assembly; and in July 1920 it came into force. By his open adhesion to "Westernism" and the policy of the League of Nations, Renner made known Austria's honourable intention of taking her stand entirely on the basis of the Peace Treaty, in which case she hoped for help from the Entente in her destitution, which had been made deeper by the operation of the Treaty. In Dec. 1919 the Chancellor found an opportunity of making personal representations in Paris as to the sufferings of his country; in Feb. 1920 other Austrian statesmen were in a position to do the same. Indeed, on more than one occasion Austria received temporary assistance. Moreover, the general right of the Entente to a mortgage on all Austria's assets, provided for in the Peace Treaty, was so far limited as to facilitate the acquisition from abroad of those commodities which were most pressingly necessary for the moment. A special "Austrian Section of the Reparations Commission" was appointed to study the measures most necessary for a lasting cure for the ills of the body politic, and met in Vienna on April 17, 1920 under the presidency of Sir William Goode. The international commissions which were to supervise the disarming of Austria by land, water, and air, also came into operation, and thus Austria's sovereignty no longer existed except in appearance.

Renner's first cabinet was followed in Oct. 1919 by a second one composed of the same parties. It had also the task of establishing normal relations with the neighbouring states. The visit made by the Chancellor to Rome in April 1920 on the invitation of Italy—on which occasion he was also received at the Vatican—was a not unavourable introduction to these efforts. Among the "succession states" it was chiefly Czechoslovakia to which the Social Democratic party, which was as influential as ever, felt itself drawn, not only for economic reasons but also owing to the many points of contact which existed between its standpoint, with regard to Central-European problems, and that of circles in Prague. The frontier questions raised by the Peace Treaty were not settled in favour of Austria, which lost among other places the important railway centre of Gmünd. In the economic negotiations advantage was taken by the Czechs of Austria's dependence on the Bohemian coal supply. On the other hand, in certain matters (naturalization, option, protection of minorities, division of collections and archives) a compromise was arrived at.

On the southern boundary Yugoslavia had to give up the strip of Styrian territory which had not been assigned by her the Treaty of St. Germain. The Klagenfurt basin also remained Austrian, thanks to the result of the plebiscite of Oct. 1920, in which 60% of the votes were cast against Yugoslavia. Trade relations were established with the kingdom of the Serbs, Croats and Slovenes, as with other states, at first on a basis of exchange of commodities, but were later regulated by commercial treaties. A variety of disturbances occurred from time to time in the relations with Hungary, where, at the beginning of Aug. 1919, the Soviet system had broken down. While the Christian Socialists viewed the new course of events in Hungary with sympathy, the Social Democrats and those with Great German sympathies—the latter because they saw their national alms endangered—were anxious lest the revolution in Budapest might bring about a restoration of the Habsburgs in the basin of the Danube. Causes of discord soon made their appearance. From the outset the Hungarian government took a decided stand against the Union of the Hungarian territories with the Austrian part of the Burgenland (German Western Hungary) to Austria. Austria declined to hand over Béla Kun and the other former "people's commissaries" who had taken refuge in Vienna; it even found itself bound in consequence of the Copenhagen Agreement, concluded with the party in power at Moscow, to aid the escape of the Hungarian Soviet leaders to Russia, in order to obtain the return of their own prisoners who were still kept in Russia. Only a few weeks before (June 20, 1920) the International Trade Union Congress at Amsterdam had threatened Hungary with a boycott. Since this had only been exercised with severity in the case of Austria, the Hungarians regarded the Social Democrats of Vienna as having provoked it. The growing estrangement found expression in a few unfortunate frontier incidents, from the Hungarian side. It also had its effect upon the internal politics of Austria, for the Social Democrats sought to prove from documentary evidence that Hungarian Government officials, in their various conspiracies against the Austrian Republic, had relied on the support of the Vienna Christian Socialists.

At this point the coalition between the two great parties could no longer be maintained. The Christian Socialists had gradually become sick of it since the Social Democrats would not allow them as much influence as seemed in accordance with the increasing tendency of public opinion towards the Right. On the other hand, the Social Democrats, by their participation in a "bourgeois" Government, gave the Radical elements in their own party, as well as the Communists, a handle for attacking them, which threatened the carefully preserved united front of Social Democracy with serious danger. In view of this tension, an occasion which was not in itself of any special importance sufficed to split the Government coalition on June 10, 1920. Otto Bauer could justly regard the review of the Treaty by the Hungarian government, with the Christian Socialists, which had achieved as much as was possible for a beginning. The Republican legislation had answered, in so far as that was within the bounds of possibility, to the desires and interests of the urban proletariat. The position of the labouring class had also been recognized by the State. In the militia question the Social Democrats had entirely triumphed. Under the impression of the recent "Kapp-Putsch" in Germany they succeeded in forcing through a defense-law, which set up a machinery of soldiers' councils for the professional army provided for by the peace Treaty; seconded all political liberties, including also the "right of coalition" to those who had completed their service in the defense force, and by this means assured to the Social Democratic party for a long time to come predominant influence over the State's best source of power. As a set-off to these successes the Christian Socialists had managed with difficulty to protect their peasant franchise against inconvenient innovations, and to prevent questions of Church and State, education and the like from emerging in a critical form.

The place of the Renner Government was taken temporarily by a "Proportional Cabinet" ("Párat Borzobiadat") in which every party was represented by delegates without undertaking any responsibility for the Ministry as a whole; and it had to
carry on business up till the new elections, which were fixed for Oct. 17 1920. In the meantime it was naturally incumbent upon the Constituent Assembly to carry out its own particular task and give a definitive constitution to the "Federal State of Austria." Besides this the bill dealing with what had once been a considerable tax on property, namely the war-profits tax, was passed, under pressure from the Social Democrats in particular.

At the new elections the Christian Socialists obtained 82 seats, the Social Democrats 66, the Great German party (formed from the old German National party and kindred groups) 19, the German-Austrian Peasant party seven, the Bourgeois Labour party one. The distribution of the 92 seats in the newly created second chamber, the Federal Council (Bundesrat), represented a similar balance of power. On Dec. 9 1920 both Houses joined in the Federal Assembly (Bundesaussammlung) in order to elect the Federal President, Dr. Michael Hainisch. The new Cabinet, composed of Christian Socialists and officials, was under the presidency of the Christian Socialist Dr. Michael Mayr, who had already presided over the "Preporzkbud". While the Great German party assured the Cabinet of their benevolent neutrality, the Social Democrats went openly into opposition. They had had, indeed, to record a loss of votes in comparison with the 1910 elections, but they had none the less succeeded—in contrast with the fraternal conflicts of most other countries—in saving the party from disintegration. Even their relations with the Communists, thanks to no small degree to the platform of compromise adopted by the "Workmen's Congress," remained open. For a time it seemed as if they might have been tolerable up to the summer of 1920, though bitter hostilities afterwards broke out on both sides. Thus in Feb. 1921 the Austrian Social Democratic party had the satisfaction of holding together, in the spirit of its principles and under its patronage in Vienna, representatives of all international sections, from the Zimmerwaldians to the International Labour Association of Socialist parties. The tactical principles upon which this took place involved a compromise between the programme of action of the Second and the Third International, on which account the new Labour Association was given by its enemies the scornful title of the "International Two and a Half."

The pitiable condition of the Austrian State grew worse and worse. Neutral and former enemy countries did all they could to save the country from the worst; in particular, powerful relief measures of every kind had saved the population of Vienna from dying of hunger. It is true that the want of cooperation between the United States and the Western Powers had so far rendered it impossible to provide that far-reaching assistance which might ensure lasting salvation for Austria. Sir William Goode's plan for putting Austria into a sound financial condition, which clearly proved that the Austrian problem was not one of finance, but a comprehensive political and economic one, had to be shelved, like those also propounded by Loucheur and Ter Meulen. At the end of March 1921 the Federal Chancellor Mayr learnt in London that the financial regeneration of Austria was to be handed over to the League of Nations, to which Austria had belonged since Oct. 1919. The "Austrian Section" of the Reparations Commission left Vienna a few weeks later (April 30 1921), the military supervisory commissions of the Allies having already been dissolved some time before. Financial delegates of the League of Nations arrived, to take up once again the study of the Austrian problem. The continued absence of organized help from the Entente had meanwhile—in spite of the counter-activity of the Vienna Christian Socialists, to whom is chiefly due the idea of a "Danubian Confederation"—strengthened Austrian opinion in favour of union with the large economic area of Germany. On April 24 1921 the overwhelming majority of the Tirolese declared themselves in this sense by a plebiscite which was carried out in defiance of the wishes of the Government; the Diets of other Territories proclaimed their desire to follow the example of Tirol. The ex-Emperor Charles's visit to Hungary at Easter had also called attention once more to these political questions. This occasioned two serious parliamentary conflicts, in the course of which the Michael Mayr Government was at times only able to obtain a majority of one. It was further evident that in spite of its conservative character the Cabinet had been unable to bring about an improvement in relations with Hungary. It could only have been purchased at the cost of concessions which would practically have amounted to the renunciation by Austria of the Burgenland (German Western Hungary). The position of the Government was only strengthened to a certain extent by the fact that in May 1921 all parties assured the Government of their support in the economic and financial measures desired by the League of Nations.

See Dr. Karl Neisser, "Politischer Chronik" für 1918-19; Ein Jahr Republik Österreich (1920); Österreichisches Jahrbuch, 1920 (1921); Gustav Stolper, Deutschösterreich als Social- und Wirtschaftsproblem (1921).

ECONOMIC CONDITIONS

The collapse of the Austrian Empire, as such, resulted in the rapid disruption of an extensive economic area and entailed the severance of an economically restricted German-Austria, which contained only little fertile land, from the agriculturally rich territories of the seceding states. Thus the early cessation of the food supplies which the states of Austria had been sending into Austria rendered the position worse, especially as regards Vienna, and even then, in the days of the transition period, the authorities had to appeal to foreign Powers to help in the relief of the food shortage. The anxiety to procure the primary foodstuffs was, therefore, the main preoccupation of the Austrian Government in the course of the ensuing two years. Accordingly, if the harvest returns of the years after the war be compared to pre-war showings, a marked falling-off of production is apparent. In the territory comprising the new Austria the net returns of the yield of wheat, rye and barley, which in 1914 amounted to 9,713,000 meterzentners, showed in 1919 only 4,518,000 meterzentners, and in 1920 an estimate of 3,500,000 meterzentners. Even if the level of pre-war harvests should be attained, only about half the requirements of the population could be met. During the last years which preceded the war an average production of 5 million m. of flour was established, while the requirements at the time amounted to 9.5 million m. The position was about the same with regard to other items of the supply of victuals. When the food problem became acute, especially as concerned Vienna, it immediately raised the question of the future of this city as a metropolis; for Vienna was the heart of a large empire, the seat of the administration of a large number of provincial industrial undertakings, and the centre of commerce and banking. Here the people had spent the income which they derived from all parts of the monarchy. Only gradually was it shown, in the first year of the republic, that the economic predominance of Vienna reposed upon a much more solid basis than had been assumed in some quarters.

At the time of the collapse the anxiety concerning the food supply found a parallel in the solicitude to obtain coal, since the Austrian output was almost wholly negligible. This, like many other products of primary importance, could be acquired only with great difficulty even in foreign countries, and, save to the extent in which it was obtainable on credit, could only be secured in moderate quantities by the release of counter-values.

The economic structure of the new Austrian Republic is best illustrated by employment statistics, which show that in 1910 agriculture absorbed 45%, industry and commerce 23%, mercantile avocations and transport 17%, the public services and the free professions 8% of the population settled upon its territory. It follows that the people were pretty evenly divided between agricultural and commercial pursuits; industry was for the most part concentrated in and around Vienna, to which city 1,800,000 of the 6,500,000 inhabitants of the state belonged.

Of the land by far the greater part is in the hands of larger or smaller peasant proprietors; 38% is covered with forests, 24% is agricultural or horticultural, 16% grazing-land in mountainous regions, 12% meadows. Conditions are relatively favourable for...
the raising of live stock, as the census of April 1919 shows as many as 1,052,000 head of cattle and 1,107,000 pigs, which in comparison to the returns of 1910 reveals a decrease of about 40% as regards the latter, of about 20% as regards the former. Austrian industry suffered grievously from the disruption of the economic area. To quote but one of the most tragic: The town which was spurn in the territory of the part of the out of Austria was for the most part waken in the countries S. of the Sudetic Mountains. For the Austrian cotton-spinning industry, with its 1-2 million spindles, could employ a maximum of about 30,000 looms, but only about 12,000 of these are situated in Austria, so that under present conditions two-thirds of the product of the Austrian cotton-spinners would have to be finished off abroad. The cloth, as a finished article, used to be made up in Vienna and then consigned to Hungary, Galicia, and elsewhere. Similar conditions prevailed also in other branches of industry in the old Austria, but, so long as there was but one connected, economic area, these conditions evolved themselves naturally, being governed by the geographical position of the factory. The setting-up of customs tariffs along the frontiers of the states which arose upon the territory of the broken-up Austria entailed serious difficulties for all industries. The fact that Austria was cut off from the areas upon which she was wont to draw for her supply of coal became a consideration of moment, since only 6% of the demand could be met by the exploitation of her own resources, while the balance required had to be obtained abroad. Private establishments had to be rationed as regards coal, and the use of gas and electricity to be drastically curtailed. In Vienna it was at one time even necessary to cut industrial establishments off the power stations. Industry received but a fraction of the coal it required, and the ironworks, in particular, suffered heavily in consequence.

The principal industries of the Austrian Republic are as follows: First and foremost is the iron trade. (Under normal conditions the Eisenindustrie in Vienna furnishes from 20 million to 2 million iron.) The industry lies within the area of the Südbahn and around Vienna; it furnishes raw material and semi-manufactured articles which also form an item of the export trade. Very highly developed, it employed in pre-war days some 30-50,000 hands and manufactured scythes, tools, saws, wire of all kinds, hard iron wares, etc. The manufacture of machinery gave employment to about 21,000 workmen, its specialty being agricultural machinery. There are four factories in Austria which construct locomotives, several which build wagons, motor-cars, etc. Of the textile industry of the old Austria the bulk is now outside her frontiers, but an important part has remained (in the Vienna area and the Vorarlberg). The great clothing industry of the old Austria had Vienna for its centre. Two branches of industry depended upon Austria's wealth in forests (1) the impregnation of spruce: the saw-mills, of which 257 were worked by steam and 5,200 by water-power; further, the furniture-manufacture, occupying about 14,000 hands; (2) the paper industry, which under full pressure furnished, in partly manufactured articles, 12,000 car-loads of cellulose and 10,000 of wood pulp; in wholly manufactured articles 7,000 car-loads of cardboard and 18,000 of paper, more than half of the products named being available for export. Further, in the working up of paper Austria is capable of good achievement. The electrical industry can employ some 25,000 hands, and the rubber and leather manufactures are of importance. Another important raw material remains to be mentioned: within the territory of the Austrian Republic an output of 200,000 tons of magnesite was reached in 1913.

The two years succeeding the war were industrially unproductive in Austria, because there was a lack of numerous raw materials, which were not to be had even for payment, since, owing to the universal shortage, difficulties were everywhere put in the way of export. After the débâcle, war industries came to a sudden standstill. The worst period of crisis was in the winter of 1918-9, and it was only in the summer of 1919 that a slow economic recovery began, based on the most part on the possibilities of export due to the conditions of the foreign exchange; at this time began on a large scale the "general clearance" of Austria by foreign purchasers who could take advantage of the low value of the Austrian kronen abroad as compared with its purchasing-power at home.

The development of industry was wholly dependent upon the quotation of the kronen, for in the spring of 1920 a slight improvement of the exchange in foreign markets caused a noticeable halt in exports, which only revived in the month of August of that year when the exchange was again on the down grade. In the autumn of 1920 a continuous improvement in the situation appeared in almost every industry; the frequent curtailments of working-hours gradually ceased, and new hands were engaged. By the close of the year the furniture-manufacture, clothing trade (including the specially prosperous shoe industry) and the leather trade showed well. Only the metal trades, which continued to suffer greatly from the sale of machinery abroad, could not distinctly improve; the locomotive works and the electrical trade were fairly occupied, but the position was especially bad in respect of the manufacture of agricultural machinery and motor-cars.

In accordance with the social and political conditions of the first year of the war, a large number of social-political measures long demanded by the working classes had been passed. Of these some had been prepared and planned by the Austrian Government before or during the war, but had partly been shelved owing to political difficulties or the opposition of the classes interested in maintaining the old conditions; partly they had been found unacceptable to the Government. Further measures of the kind seemed called for by the conditions of the moment, which urgently demanded State assistance for the classes of the population most hard hit by the economic depression, especially the rapidly growing class of unemployed whose urgent threatened violence. The most important measures were: enactment of the legal eight hours' working-day; new rules for work done at home and by children; prohibition of night work in bakeries; compulsory holidays for workers; compensation of workers and employees generally in the event of the transference of an industrial establishment, the sale of machinery abroad; legal regulation of collective bargains; establishment, on the analogy of the existing chambers of commerce and industry, of workers' chambers (Arbeiterkammern) as the official representatives of the "estate" of workers; improvement of the conditions of domestic service by a special law.

A large part of this social-political legislation was occupied by the measures intended to combat the effects of unemployment. In addition to the common results of the ending of a great war, unemployment in Austria was increased, not only by the special causes already mentioned, but by the stream of Germans expelled from other parts of the former empire. The first such steps, as Nov. 1918 State aid had to be introduced for industrial workmen and employees. The sums allowed for relief were fixed on the basis of the relief given in case of illness, and in Vienna, as a rule, attained the maximum provided for, namely six kronen, to which was added in the spring of 1919 a small bonus by the commune for fathers of families and in the beginning of 1920 a special additional grant by the State. The number of unemployed rose very rapidly: on Dec. 1 1918 for the whole of Austria the total was 46,000, on Feb. 1 1919 it was 162,000, on May 1 of that year the maximum of 186,000 was reached; but the decrease was slow, for the returns of Aug. 1 still showed 133,000 persons out of work, Nov. 2 87,000, end-Jan. 1920 69,000, and end-April 46,000. The number of unemployed was always greatest in the Vienna area, where the maximum was reached at the beginning of May with 132,000 unemployed, while on Nov. 22 there were 73,000 and end-April 1920 38,000 persons out of work. A very peculiar expedient was resorted to at the time when the conditions were at their worst. In order to occupy at any rate a part of the unemployed the factory-owners, who on April 26 1919 employed a minimum of 15 hands, were from May 19 of that year compelled to employ additional workmen up to one-fifth of their pre-war personnel and replace every unemployed man at the end of the next year. This
measures, which was meant to remain in force for only a short time, was repeatedly prolonged all through 1920. Its terms allowed exceptions and modifications under certain conditions. But if industry was able to bear the weight of such measures at all, if it was found possible to comply with them at any rate on broad lines, that is probably due to the fact that when they were made trade was progressively improving.

The recovery of industry and quieting down of the political situation made it possible from Aug. 1919 to effect the necessary reductions in the relief of the unemployed, and by May 1920 to subject the whole matter of the relief of unemployment to legislative regulation. With this object in view—apart from the fixing of a maximum period of time within the space of a year during which relief was given—all unemployment doles were subjected to rigid conditions; further, all aid accorded was based on the principle of insurance, inasmuch as the State advanced the sums required for relief but thereafter recovered a third of the amount from the employers and a like proportion from the workmen by the contribution these were made to pay, so that it bore itself but a third of the total cost. The introduction of insurance against unemployment soon led to a considerable decrease in the total of persons who received relief payments (at the end of April a total of 46,000, of which 38,000 were Viennese cases, falling by the beginning of May 1920 to 19,000, of which 15,000 were Viennese). Thus from that time onward the number of unemployed in receipt of State aid decreased by about one-half. During the remainder of 1920 there was at first a rapid increase in unemployment, which was connected with the crisis then supervening (caused by the Improvement in the exchange, which increased the cost of raw material). By July the total of persons who were out of work and in receipt of relief reached 24,800 (of which total Vienna accounted for 19,500), but thereafter the totals again proved susceptible of rapid diminution, so that by the end of the year the decrease was illustrated by a return of 16,000 persons out of work (of whom 13,700 were Viennese). By the end of 1920 unemployment in Vienna was greatest among the metal workers (34,500) and unskilled hands (2,730), among shop assistants (1,335), the employees of hotels and restaurants (1,335), in the building trade (1,430), in the catering business (700). In this group, however, figures a large number of unemployed who were not in receipt of relief.

In the period which followed the termination of the war the Social-Democratic party acquired a leading rôle in the government of the country, its programme being to attain a new economic order by the nationalization of private enterprise. A number of laws were actually passed with this end in view. The law of March 14 1919 on the preliminaries of nationalization lays down in Paragraph 1: “On grounds of public utility suitable industrial concerns may be sequestered for the benefit either of the State, the Territories or the Communes, and may be administered by the State, the Territory or the Commune, or placed under the administration of public, legally recognized bodies.” For the elaboration of further legislation aiming at nationalization a Government Commission on Nationalization was instituted and given the right to call as witnesses persons capable of giving information, inspect industrial establishments, take cognizance of the account books, etc. The law of May 15 1919, which set up the industrial councils, was also meant to serve the ends of nationalization, since on these councils the working-men were to gain an insight into the administration of undertakings and be trained for their future task of exercising a determining influence on the management of the concerns. At the same time the system of industrial councils was so planned as to fit into the economic order of capitalist individualism. “The industrial Councils are instituted in order to understand and to foster the economic, social and cultural interests of the working-men and the employees in the undertaking.” They were to safeguard the observance of contractual obligations entered into collectively, and the compliance with laws protecting the working-men, etc.; under certain circumstances they could demand the production of the balance-sheets of the undertaking; in the case of public companies they deputed two representatives into the council of administration or the board of directors, though these were not conceded the right of speaking on behalf of the company or signing for it and had no claim to monetary compensation for services of this nature. The industrial councils undoubtedly proved useful in maintaining discipline in the factories during times of disturbance. The law of May 30 1910, on the procedure in cases of expropriation of industrial concerns, lays down very general maxims which deal with the provisions of future expropriation bills. Of importance this law laid down that the process of expropriation is initiated by a resolution of the Government, which in itself entails definite legal consequences. The provisions for indemnification in the case of future expropriation, about which a lively discussion had raged, are very vague. The law of July 29 1919 on socialist enterprises seeks, with a certain tendency to the idea of guild socialism, to remodel the legal forms of business undertakings so as to at least to prepare for the transition to new economic forms. “The socialistic institutions (gemeenwirtschaftliche Anstalten) are founded by the State, by the Territory, by the Commune, or by a majority of these with public corporations, with the object of transferring existing private and public undertakings to the proprietorship or the administration of the socialistic institutions, or of starting new undertakings in this form.” These institutions were to be conducted by, among others, the corporations by which they had been established, the industrial councils of workmen and employees, and organizations representing a considerable part of the consumers of the institution’s output. A series of such institutions was founded, partly in order to take over Government factories formerly engaged in turning out munitions. Further socializing measures were arrested by the change in the internal political situation.

The economic condition of Austria noticeably improved in the course of 1920; “labour unrest” abated considerably, and by the beginning of 1921 a distinctly favourable progress was recorded in many branches of industry. This, however, could not obscure the fact that the development reposed upon thoroughly unsound basic conditions, especially upon the difference in the price level at home as against foreign countries with a healthy exchange, on a scale of wages which, calculated in foreign currencies, was extraordinarily low, while the national budget was weighted with milliards spent in the clearing of food. As Austria could not within a measurable time meet her own food requirements she was dependent upon the export of manufactured articles. It could only be hoped that, on a return to normal times, Austria, after the recovery of the exchange, would become a suitable field for industry capable of meeting competition in the world market. The town of Vienna, thanks to its central position in Europe, must always be an emporium of increasing importance and also one of the principal centres of European trade.

AUSTRIAN FAMILY OF LANGUAGES.—An addition must be made to the classification of languages given in the article PHILOLOGY (see 21,426) as the result of the further researches since 1908 in the Malay-Polynesian field and S.E. Asia. The establishment of the “Austrian family” of languages may well be considered the most important achievement of these later years in the work of comparative philology.

The essential unity of the Oceanic languages, though partially recognized long ago by Humboldt in his Kavitsprache, was not completely demonstrated until much more recent times. The connexion between the Polynesian and Indonesian languages (including the geographically outlying Malagasy) met with ready acceptance, but the affiliation of the Melanesian was not so easy. The difficulty was due to the fact that the languages in question are purely or nearly purely monosyllabic, and the evidence culminating in the pronunciation of speech being superficially very different from the Indonesian and Polynesian, partly to the diversity of the races which used the mother tongue, but quite unjustifiable, presumption that the languages were connected by the same stock. It was, however, eventually proved that Melanesian could not be kept out of the Oceanic family, and it has since been shown that Micronesia, though different in race, 1

ultimately the Oceanic languages having been delimited, they remained the only languages of their source of origin, by an ingenious comparison of purely linguistic data, Kern had shown that the common mother-tongue from which they were derived must have been spoken on some long coastline in the tropics, the east coast of Indo-China seeming on the whole to be the most likely one. Here there were actually languages, such as Cham and its immediate neighbours, which were plainly in some way connected with the Indonesian branch of the Oceanic family, and a few other small archaic Papuan groups, though the tribes that speak them are not Papuan in physical type.

A FRESHEN, THIS TIME ON THE RIGHT BANK. HIS PLAN INVOLVED A LONG NIGHT MARCH AND ASSAULT ON THE ENEMY DEFENCES, SOME 10 M. SHORT OF KUT, AT DAYBREAK. BUT ONE OF HIS DIVISIONS DID NOT ARRIVE ON TIME, AND WHEN DELIVERED THE ATTACK FAILED; AYLMER WAS THEREON REPLACED BY ANOTHER GENERAL. HE WAS GIVEN THE K.C.B., AND AFTER RETURNING TO INDIA HE COMMANDED A DIVISION THERE FOR SOME TIME. GEN. AYLMER WAS THE AUTHOR OF AN IMPORTANT STUDY ON PROTECTIVE WAR (1912-22).

AYUB KHAN (1835-1914), Afghan prince, son of Shere Ali (see 3.77), died at Lahore April 6, 1914.

AZCARATE, GUMERSINDO (1840-1917), Spanish politician and lawyer, was born at León, Spain, Jan. 13, 1840, and was educated at the university of Oviedo, whence in 1858 he went to Madrid and graduated in law, science and philosophy (1861). After obtaining a post as assistant in a public office he returned in 1868 to Madrid as assistant professor of comparative jurisprudence and in 1872 was appointed professor. He was of the little band of Liberals who preferred to resign in 1875 rather than submit to the famous Orovio decree limiting the liberty of the chair. He was, however, reinstated six years later and became one of the central figures of the group headed by Don Francisco Giner, to which Spain owes most of its up-to-date educational institutions. He sat as deputy for León from 1886 to 1890, from 1891 to 1895, and for later periods. In 1892 he became professor of private law at Madrid. In politics he was a moderate republican. He was a keen student of English institutions and an admirer of English political life. In later years he accepted a share in official administration, notably as the head of the Instituto de Reformas Sociales, which he had invested with his incomparable moral authority. He had also approved of the Reformist evolution of Señor Melquiades Alvarez. The austerity of his political views was such that on being defeated at the last general election he fought, he refused a seat as senator for life, which was offered him by the Government. He died at Madrid Dec. 14, 1917.

AZCARRAGA Y PALMERO, MARCELO (1832-1915), Spanish soldier and politician, was born in Manila in 1832. He early saw service in Spain during the mutinous outbreaks in Isabella's reign (1834-6) and was next sent to Cuba and on a special mission to Mexico, later belonging to the expeditionary army against that country. He was promoted colonel in 1866 and entered the Ministry of War. He was employed by the Spanish republican Government of 1868 as chief of staff at Cartagena and later of the army of the North. After the accession of Alphonso XII, he became field marshal and Under-Secretary for War. He sat as deputy for Morella in the first Restoration Parliament. In 1885 he was elected senator for Navarre and was Minister for War under Canovas (1891-2) and again in 1895, becoming head of the Cabinet in 1897 after Canovas's assassination. In Sept. 1904 he retired from the army at the age of 70 with the rank of general, and in Dec. of that year was again for a few weeks prime minister. Throughout his political career he was associated with the Conservatives but took little part in party struggles. He died May 30, 1915.

AZERBAIJAN.—The republic of Azerbaijan had no political existence until the year 1917, when the Trans-Caucasian provinces of the Russian Empire, exposed to the enemies of Russia, found in the collapse of the empire the need and opportunity of striking out for themselves. Nor has Azerbaijan any national traditions or history; scarcely, till lately, had her people a racial consciousness, the name, even, did not apply to the present state. Under Russian administration Trans-Caucasia comprised six "Governments." Of these Baku, with a coastline on the Caspian Sea, and Elisavetopol, adjoining Baku on the west, united to form the republic of Azerbaijan. The territory included in the two "Governments" was, originally, the portion of the Persian province of Azerbaijan (see 3.86) ceded to Russia as long ago as 1813 under the treaty of Gulistan. Once a Russian possession, the ceded area lost all connexion with its previous name. But when in 1917 the two "Governments" combined to declare a joint independence the Persian name was adopted for the infant state from motives of policy—"it was hoped thus to attract to the new republic the Persian remainder of the old province of Azerbaijan, peopled chiefly by the same stock.

Geographical Position.—Looked at broadly the republic occupies the lowlands of two great Caucasian river basins—the Kuru and the Aras—enclosed by the Caspian Sea, the Caucasus mountains, the watershed parting of the Black Sea, and the highlands of Armenia and Persian Azerbaijan. This fertile territory, which also in oil, has a coastline to the Caspian exceeding 400 m., and stands athwart the chief line of communication between the Black Sea and central Asia. Two-thirds of its population is a homogeneous race of Tatar origin closely related to the Anatolian Turk. They speak a form of Turkish, but, unlike the Turk, are Moslems of the Shia sect: with their Sunni kinsmen of Anatolia they have, however, a definite sympathy.

Area and Population.—The area of the "Governments" of Baku and Elisavetopol together was about 32,000 sq. m.; their pop., by the Russian census of 1917, somewhat less than 2,660,000. This total comprised, in round figures, 1,740,000 Moslems, 540,000 Armenians, 230,000 Russians and other Europeans, and diverse elements as the remainder.

The territory claimed by the republic is not, however, altogether that of the "Governments" of Baku and Elisavetopol; but it is only of these that definite figures of area and population can be given. For districts containing in all some 15,000 sq. m., partly within and partly without the boundaries of the two "Governments," and carrying a pop. of nearly a million, are in dispute between Azerbaijan and the adjoining republics of Erivan and Georgia. Settlement of these disputes may give Azerbaijan a greater or lesser area and population than had the two "Governments."

Industries and Communications.—The chief industry of the country is the production, refining, and exportation of oil and petroleum. Within 50 years the immense oil deposit discovered on the Apsheron peninsula had created the city of Baku, now the capital of Azerbaijan, with a pop. of 250,000. Indeed the production of oil in vast quantities in this region has had far-reaching indirect political results. It has given the state an importance out of proportion to its population, by placing wide adjoining regions in a position of dependence regarding the vital commodity of oil for light and fuel. Still more, it has profoundly affected the direction given to lines of railway, and the development of rail and other forms of communication.

By this process, and from the position of Baku as a port on the Caspian Sea—a sea nearly twice as great in area as all the Great Lakes of America together—the city became a centre with lines of communication, by rail and sea, radiating from it in all directions. From Baku the Caspian Sea is crossed by ferry steamers to Krasnovodsk; and thence a railway runs for nearly 2,000 m. through central Asia, skirting the Afghan frontier, and reaching the Pamirs. The city is in direct rail communication with Moscow; by railway, sea, river or canal every part of European Russia, in fact, is within reach. By sea N. Persia ports are only one day's steaming. Through Trans-Caucasia Baku is in direct railway communication with Erivan, Tabriz in N.W. Persia, Erzerum in Turkey, and Batum on the Black Sea. Batum, indeed, is complementary to Baku as the terminus not only of the Baku—Black Sea railway, and of the pipe-line for conveying oil, but as the one port by which the great inland centre of communication and oil production, embedded deep in highland Asia, can have a direct intercourse with the oceans and outer countries of the world. The interdependence of Baku and Batum was well enough with all Trans-Caucasia under one Government; with the two cities in separate states friction became inevitable.

Had there been no oil at Baku events in the Near and Middle East during the years 1913-21 would have shown a striking dissimilarity from the events which actually befell. Such is the important position Azerbaijan fills, by reason of Baku, on the confines of south-eastern Europe and western Asia.

External Influences.—In the Pan-Islamic dreams cherished by the Young Turk leaders of Turkey, the republic, with Persian
Azerbaijan, forms the essential connecting link between Islam of the West and Islam of central Asia and India. Pan-Islamic policy therefore closely affects Azerbaijan. But a further and more serious disturbing influence has been provided by Bolshevnik Russia. For economic reasons, and in pursuit of her ambitions in southwestern and central Asia, the geographical position held by Azerbaijan made control of the republic a pressing necessity. The short and varied history of this small Caucasian state is, in consequence, concerned chiefly with the interaction of Turkish and Russian policy, and the inevitable question of Armenia and the Armenian people.

History.—The history of Azerbaijan as an independent state may be said to have begun on Sept. 29, 1917. During the spring and summer of that year upheaval in Russia had passed from symptoms to facts of omen for the world. In March the Government, re-formed, a Provisional Government, was proclaimed, and the Tsar abdicated; and in April the Provisional Government issued its proclamation declaring for the self-determination of peoples and the establishment of a lasting peace. In June the Black Sea fleet mutinied, and the Russian armies in Asia Minor, saturated with Bolshevnik theories and shouting "No annexations and no indemnities!" abandoned their positions before the enemy and retired behind the Russo-Turkish frontier of 1914. On Sept. 15, Russia became a republic.

Need for common action by the Caucasian peoples was evident, as the Turkish front was held now by troops whose military value was fast disappearing. There was, further, at least on the part of Georgians and Armenians, a genuine desire to use the opportunity for securing some form of independence which should safeguard their national rights. The creation of the Russian Republic was followed, two days later, by a Council of the Trans-Caucasian peoples, assembled at Tiflis, proclaiming Trans-Caucasia a Federal Republic. This step involved removing a Russian Bolshevik Commissar who had already been sent to Tiflis to replace the Viceroy and Commander-in-Chief, the Grand Duke Nicholas. The Commissar was ejected, but he transferred himself to Baku and there with Armenians established a Baku Government. But the fortunes of the Federal Republic did not prosper. Between Georgian and Armenian Christians, and the Tatar Moslems of Azerbaijan, were antipathies of race and faith not to be suddenly diminished or held in check. Each people, too, had its own particular interests to consult. Jealosities and rivalries were acute; Erivan and Azerbaijan had deep suspicions that Georgia was scheming to use the Federal Republic for converting all Trans-Caucasia into a Georgian state. A fundamental opposition of outlook also existed on the part of each. All three desired to come under British protection; but that being impossible Azerbaijan stood out for independence as the best chance for Georgians, Armenians, and Tatars. Russia, therefore, as the powers best suited and able to assure Trans-Caucasian independence. To the leaders of each of the federated peoples, in fact, the essentials of a rapidly changing situation ever appeared different.

The Treaty of Brest Litovsk, between Germany and Russia, signed on March 3, 1918, was followed by a Turkish invasion of Armenian territory in order to occupy the districts awarded Turkey under the treaty. Batum was another district allotted to Turkey, subject to self-determination by the inhabitants, but Georgia believed that with German aid the province might be preserved for herself. In effect, the Federal Republic was now at war with Turkey, though with no intention or possibility of concerted action amongst its peoples, and the Turkish occupation proceeded in spite of resistance on Armenian territory. Batum, too, was entered by Turkish forces on April 15. In these circumstances the republic resolved, on April 23, to make a formal declaration of independence, and to open peace negotiations with the Turks. But a German penetration of Trans-Caucasia from the Ukraine was now in sight. Odessa and Sevastopol were both in German hands at the beginning of May, and Georgian policy looked more and more definitely to Germany, to the exclusion of the wider interests of the Federal Republic. A few days later German and Turkish delegates reached Batum to negotiate peace between Georgia and Turkey. This matter completed, Georgia and Germany concluded a treaty between themselves, by which German troops were admitted to the country, and Georgia received promises of protection, the maintenance of her independence and financial assistance. As has been said, a Russian Bolshevik Government had been established at Baku after the founding of the Federal Republic of Trans-Caucasia. The area it controlled was small, but the Government had the advantages of position, supplies of fuel and food, and the comparative wealth afforded by the large and prosperous population. The Russian element behind the Government was also supported by local Armenians, a section of the inhabitants numbering some 60,000. These Armenians were under the influence of the Dashnaks, the Armenian revolutionary society of extremists, whose methods were violently opposed by the Government. It was not until early in March, when the affairs of Trans-Caucasia were at their lowest, and the existence of the Federal state hung in the balance, the Russians and Armenians of Baku ejected the Tatar Moslems of the city, and massacred some thousands. During the succeeding three months, massacre of Moslems by Armenians spread to various parts of what had been Russian Armenia. With Georgia in private alliance with Germany, and Armenians massacring Azerbaijan Moslems whenever opportunity offered, the Federal Republic of Trans-Caucasia had become to all merely an empty name. The Federal Republic was dissolved on May 26, 1918. On that date Azerbaijan and Georgia each proclaimed its separate existence as an independent republic and formed a National Government; at the same time the National Council of Armenia took control of Armenian affairs. As the independent Bolshevik Government of Baku still existed Elisavetopol became the capital of Azerbaijan for the time being. Turkish troops were now admitted to the Tatar Republic; and others, followed by Germans from Georgia, reoccupied Tabriz, the capital of Persian Azerbaijan, at the end of May. The Pan-Islamic policy of Turkey appeared to be prospering at this time. And under pressure of Persian and, to a degree, German influence, the German army and Government in Persia was strengthened, and the possibility of an operation from that base against Trans-Caucasia was drawing to an end. The Armistice between the Allies and Turkey, signed on Oct. 30, and between the Allies and Germany 12 days later ensured the evacuation of Trans-Caucasian and Persian territory by Turkish and German troops. A British force from Persia reoccupied Baku on Nov. 16; a British garrison was placed in Batum on Dec. 27; and before long a whole British division had reached Caucasus to ensure the evacuation of Turks and Germans. The railways were repaired, and through traffic between the inland republic and Batum resumed under British Railway Control, thus preventing the acute friction of the past.

On the withdrawal of Turkish troops from Baku the Government of Azerbaijan was established there, and endeavoured to organize an administration. This was a work of infinite difficulty, for though the Moussavat party in power meant well, every kind of administrative experience and knowledge was lacking. The British military authorities assisted, but soon found it necessary to take over multifarious civil functions, from providing and rationing foodstuffs, suppressing profiteers, working the oil and shipping industries, and managing the State bank, to the administration of Posts and Telegraphs, Police and Justice. For the first time since Russian Government ceased in Trans-Caucasia order appeared in the republic. But the
change depended on foreign ability and experience, and when
the British troops were withdrawn in Aug. 1919 Azerbaidjan
relapsed into administrative confusion. An inter-state control
of railways only was provided with some success, as a matter
vital to all Trans-Caucasia.

The Peace Conference of the Allies which began its sittings
in Paris on Jan. 18 1919 did not greatly affect Azerbaidjan,
though the republic sent a delegation to represent its claims to
large territorial extensions. The course taken by events in
Trans-Caucasia before the Treaty of Šèvres was finally drafted
doubtless placed Azerbaidjan outside the area to which it was
thought treaty provisions could be applied. Except regarding
frontiers in dispute between Azerbaidjan and Armenia the Treaty
of Šèvres, therefore, avoided matters affecting the Tatar Republic.

For these frontiers it provided that they should be settled by
direct agreement between the states concerned; and, failing
such agreement, they were to be determined by the principal
Allied Powers.

The Conference gave, however, no little attention to the
problems of Trans-Caucasia. Early in 1919 it offered Italy
control of the whole area, she having many interests there; but
the offer was declined after consideration. As an emergency
measure the Supreme Council appointed an Allied high commis-
sioner to prevent territorial disputes developing into hostilities
between the republics; and by his influence neutral zones for
the time being were established, and the situation was tempor-
arily eased. But months passed and the Conference became
more and more chary of intervening in Trans-Caucasian affairs,
especially in view of Gen. Denikin's operation in Cis-Caucasia,
and his aim of reuniting south-eastern Russia. Stated shortly
the shadow of Russia—Russia both of the present and of the
future—lay over the land and created an incalculable situation.
De facto recognition was, however, accorded all three republics.
It should be noted, further, that in the draft of the Treaty of
Šèvres the importance of Batum to Azerbaidjan and Armenia was
recognized by making the town and surrounding territory a
free state under the League of Nations, and giving the inland
republics definite rights in the port and of access by rail. But
this plan fell through, and Batum was returned to Georgia,
under an agreement confirming Azerbaidjan and Armenia in the
privileges they were to have received from the free state of
Batum.

The Turkish Nationalist movement which became all-powerful
in Anatolia in consequence of the Treaty of Šèvres had a serious
influence upon the republic of Azerbaidjan. Nationalist Turkey
and Soviet Russia each found itself opposed to the Allied
Powers. They therefore followed a common policy up to a point;
and Turkish Nationalism and Russian Bolshevism went hand in
hand, supplying each other's needs as far as might be, whether
of means, material or opportunity. Turkey sought to recover
the provinces in Trans-Caucasia from which she had been ejected
by the Allies in 1918; she also required munitions from Russia,
and direct access to Azerbaidjan and central Asia in execution of
her Pan-Islamic ambitions. Russia had her own quarrel with
the Allies to pursue, and her revolutionary mission to accomplish
where she could. The oil of Baku, further, was a necessity for
her economic life. These different aims of both countries
converged on Trans-Caucasia, and implied the bringing of the
Turkish and Russian territory to a common frontier—at least
to a common frontier of effective control. Once this was attained
all other things would be secured, including direct railway
communication between Russia and Anatolia. Denikin had
been driven out of Russia and now only the independent repub-
lies of Azerbaidjan, Erivan and Georgia stood in the way.

Russia therefore prepared to set up a Soviet Government
in Azerbaidjan, and under cover of this change reëstablish Russian
control first there, and afterwards in all Trans-Caucasia. On
April 29 1920 the XI. Soviet Army from Cis-Caucasia, some
50,000 strong, entered Baku without fighting. Simultaneously a
rising of local Bolshevists declared the Republican Government
deposed, and established in its place a Soviet Government in
alliance with Moscow. The Russian army, it was said, had only
come to place the proletariat of Azerbaidjan upon its feet.
Effective opposition to the revolution was found impossible.

The Azerbaidjan army was disbanded; a revolutionary committee
set up which sent the members of the late Government and many
leading anti-Bolshevik citizens to execution; and Bolshevist
economic theories were rigorously applied. Having seized the
railways and consolidated their position in the country the
Bolsheviks attacked Georgia and Erivan across the frontier of
Azerbaidjan, but were repulsed without much difficulty. Russia's
campaign in Poland was in progress at the time, and not going
well, and further aggressions in Trans-Caucasia were therefore
suspended. During this pause a Tatar rising took place at
Elisavetopol, in which several thousand Bolshevists were
massacred. The rising was promptly suppressed by Bolshevist
troops; and they, aided by local Armenians, retaliated by
massacring, it is said, some 15,000 Tatars of both sexes and all
ages. From this affair arose the hatred which the Tatars of
Azerbaidjan have since displayed against the Bolsheviks.

Further Bolshevist and Turkish operations against Georgia and
Erivan do not properly belong to Azerbaidjan history, but they
cannot be altogether ignored. Suffice to say that when Russia, in
the autumn, was relieved of her Polish embarrassments, and the
campaign of Gen. Wrangel from the Crimea had plainly failed,
she and her Turkish Allies turned their attention once again
to Trans-Caucasia. By the end of Nov. both Georgia and
Erivan were crushed, and Soviet Republics, dependent on
Moscow, established in place of the National Governments.
Turkey regained the districts of Ardahan and Kars; in addition
she was given the strip of Armenian territory through which
passed the railway from Azerbaidjan to the Turkish frontier;
but Russia with an eye to her own future, insisted that Batum
should form part of Georgia, and her will in the end prevailed.
Russia, in fact, had recovered all but an insignificant portion
of her Trans-Caucasian provinces; and Azerbaidjan, Georgia, and
Erivan ceased to exist as independent states, except in name.

(W. J. C.*)
BACCELLI, GUIDO (1830-1916), Italian physician and politician, was born at Rome 1830, and died at Rome Jan. 11 1916. After graduating in medicine at the university of Rome, he was appointed assistant professor of medical jurisprudence in 1856, and some years later became professor of clinical medicine. He soon acquired a great reputation as a practicing physician, being especially notable for his knowledge of the pathology of the heart and to malaria; his studies on the latter subject proved of great value for the reclamation of the Roman Campagna and other fever-stricken zones. In 1875 he was elected deputy for the 3rd Div. of Rome, which he continued to represent until his death.

He was Minister of Education in the Cabinets of Cairoli (1879-81), Depretis (1881-7), Crisci (1883-6), and Gen. Pelloux (1889-9), and of Agriculture under Zanardelli (1901-3); from 1889 to 1893 he was vice-president of the Chamber. A keen classical scholar, he took an active interest in archaeological matters, although in some of his projects, such as the famous *Passaggiata Archeologica* in Rome, he showed more enthusiasm than judgment. His labors for the isolation of the Pantheon and the creation of the Museum of Ancient Art and of the Modern Art Gallery in Rome deserved and met with more general approval.

BACON, HENRY (1866- ), American architetc, was born at Watseka, Ill., Nov. 28 1866. In 1884 he entered the university of Illinois to study architecture, but in the following year began work in the office of Chamberlin & Whidden, in Boston, where he remained three years. In 1887 he was with McKim, Mead & White, in New York, excepting the years 1880-91 which he spent in Europe as Rotch Traveling Scholar. From 1897 to 1903 he was a member of the firm of Brite & Bacon, in New York, and thereafter practised alone.

Among his important works were the Court of the Four Seasons at the Panama-Pacific Exposition; the Union Square Savings Bank, New York City; the Public Library, Paterson, N.J.; the Waterbury General Hospital, Waterbury, Conn.; and the Whittmore Memorial Bridge, Naugatuck, Conn. Of numerous monuments, some designed in collaboration with various sculptors, the following should be mentioned: the Lafayette Monument, Brooklyn, N.Y.; the Lincoln Monument, Lincoln, Neb.; the Longfellow Monument, Cambridge, Mass.; the Republican Monument and the Centennial Monument, Chicago, Ill.; the President Harrison Monument, Indianapolis, Ind.; the Civil War Memorial and World War Memorial, Yale University; and the Parnell Monument, Dublin, Ireland. In 1920 the Lincoln Memorial, at Washington, D.C., designed by him, was completed, costing more than $3,500,000.

BACON, ROBERT (1800-1919), American banker, was born in Boston, Mass., July 3 1800. He graduated from Harvard in 1880 (in the class with Theodore Roosevelt), and the following year entered the banking house of Lee, Higginson & Co., in Boston. In 1883 he became a member of the firm of E. Rollins Morse & Bro., and in 1894 joined the house of J. P. Morgan & Co., in New York. After conspicuous success in the financial world he resigned in 1903. He was Assistant Secretary of State, 1905-9, and then for a short time was Secretary of State, succeeding Elihu Root on the latter's election to the Senate. He was ambassador to France from 1903 to 1912. He attended the first Plattsburg Camp and was commissioned major in the U.S. Reserves in 1917, being assigned to the staff of Gen. Pershing with the A.E.F. in France. He returned to America with the rank of colonel, in 1918, and died in New York City, May 29 1919.

BACTERIOLOGY (see 3.156).—Since bacteriology is so comparatively young a science, dating, as it does, from the introduction by Koch in 1880 of methods of technique which have made it an exact science, it is not surprising that the decade from 1911 to 1921 saw very considerable additions to our knowledge of the life and functions of the microorganisms with which it is concerned. These additions to knowledge will be reviewed here under two headings: general and agricultural, and medical.

I. General and Agricultural.

Variations in Bacteria.—It is probable that nuclear fusion between male and female gametes is essential for the preservation of the special characters of an organism, and that in absence of sex fusion a species will tend to break up into a number of different strains. So far no fusion, either sexual or otherwise, has been observed amongst the bacteria. The characters of bacteria are extraordinarily liable to change according to the conditions of cultivation. Variations in morphology, cultural characters, physiological behaviour, virulence and pathogenicity have constituted one of the most striking features of modern bacteriology. Innumerable instances of such variations have come to light; space will permit of the citation of only a few typical cases.

* Bacillus coli* in the peritoneal cavity in the ease of ascites may take the form of a diplococcus; in milk or in urine it may develop into a dense network of branching filaments resembling *B. anthracis*. *B. carotovorum*, an organism causing disease in many vegetables, when present in the plant tissue appears as a very small rod; cultivated on artificial media the rods are much larger; in broth it grows in the form of long branching filaments, and in broth containing submerial doses of antisepsics, e.g. phenol and alcohol, it develops as a minute coccus.

It has recently been shown in separate communications that certain organisms, *B. lepisepticum* and *B. dysenteriae*, when cultivated on the same medium, soon form two types of colonies. One type, forming round colonies, the other diffuse and spreading ones; these types show variations also in agglutinability and in virulence, though otherwise the specific characters are identical. Since separated, the spreading forms in both cases remain true to type, and the question arises whether both strains coexist in the materials taken from the infected animals or whether the spreading forms appear as mutants shortly after their removal from the natural habitat. This question can only be answered by investigations of cultures derived from single cells; the finding of segregation of mutants in cultures of this type would be of the greatest interest, but at present such investigations have not been conducted.

The sugar-fermentation reactions upon which much reliance is based in the diagnosis of species are unfortunately very susceptible to change under different cultural conditions; organisms can be "trained" to acquire fermenting powers which they normally possess. Strains of *Bacillus carotovorum* isolated from diseased plants grown in different localities were found to possess many various sugar-fermenting powers, but when cultured simultaneously through several transfers under the same conditions and again tested, all gave identical reactions.

All pathogenic organisms rapidly lose the properties of virulence which they have acquired in their hosts, and once lost it is very difficult to restore this character. Virulence is altered rapidly by a change of environment; the attenuation of the anthrax bacillus by cultivation at 40° F. instead of at blood temperature is a well-known phenomenon. Since reduction in virulence is attained by cultivation of organisms in presence of antisepsics.

One and the same species of an organism may give rise to different symptoms of disease in different individuals. The pathogenesis of *Bacillus anthracis* is considerably altered by exposure to the ultra-violet rays; the symptoms produced on inoculation of the altered strain into an animal are quite unlike the normal symptoms of anthrax. The change which the organism undergoes in the treatment with the ultra-violet rays persists after daily subculture for upwards of two months.

**Transmutation in Bacteria.**—Many experiments have been described wherein bacteria became so changed in character as to suggest that they had undergone transmutation. One must not forget, however, that usually in dealing with cultures of bacteria, one has a mixed population, the progeny of several individuals. Even though the culture may be made from a single colony on a plate it is more than probable that such a colony has arisen from a number of organisms herded together.

The method of culture of such a population will tend to favour one strain and depress others, so that this strain may eventually be separated and appear as a mutant.

One piece of work, however, which requires confirmation before it can be accepted, and one that has been stated in a preliminary communication that *Azotobacter* may give rise to practically every form of organism to be found in the soil.

The large round form of *Azotobacter* is said to pass in old cultures into a plasmoidal stage from which it may emerge in the various
forms of bacilli, cocci, sarcinae, clostridia, etc.; in fact, all the forms
common in the soil are held to be only stages in the life cycle of a
single species. If this should be confirmed by future investigations,
the whole basis of the science of bacteriology will be profoundly
modified.

Industrial Applications of Microbiology.—In the fermentation
industries much use has been made of the variations that can be
induced in microorganisms by cultural methods. For example,
in the alcoholic fermentation by yeast glyc erine figures as a by-
product to the extent of some two or three per cent of the sugar
fermented; by the addition of antiseptics, however, to the fermentation
vessels the percentage is altered and the percentage of
glycerine is increased to some 33 per cent. Again, dextrose is
converted by Citromyces into citric acid, oxalic acid and carbon
dioxide; the percentage of citric acid is normally not great, but by
high concentration of sugar and low concentration of nitro-
genous food it can be raised to 500. The production of acetone
and that of alcohol from maize by biological methods are processes
which have been successfully worked during the World War, and
encourage one to look forward to considerable developments of
microbiology as applied in the factory.

Bacteria of the Partial Sterilization.—Researches at the Rothamsted
Experimental Station have proved that soils which have been treated with certain volatile antiseptics or
heated to temperatures between 56° and 100° C. show a marked
increase in fertility. This results from a parallel increase in the
bacterial activity, whereby the rate of the conversion of the
organic nitrogenous matter of the soil into nitrogen compounds
which are readily available as food for the plant is considerably
enhanced. The number of bacteria normally present in soils
varies from about 4 to 60 million organisms per gram. Under
the above treatment with antiseptics, or heat, the majority of
the organisms are destroyed and the number of active bacteria is reduced
to a few hundred only. By no means all are destroyed, however,
since many of the organisms of the soil are of the spor-forming
kind and are thus able to withstand the treatment. After the
removal of the volatile antiseptics, or after cooling of the soil,
the germination of the spores is unhindered and the bacterial
population of the soil is quickly reestablished. The treatment
renders the soil more suitable as a medium for bacterial growth,
so that the number of organisms quickly exceeds by some six or
sevenfold the original bacterial content of the soil, or rather that of
a control sample with untreated soil kept under the same physical
circumstances as the treated sample. This remarkable discovery
was made in 1909. As a matter of fact it was not an entirely new
discovery; reference to the literature showed that the phenom-
enon had been observed many years earlier by German scientists,
but they had curiously failed to grasp the important significance
in its relation to the fertility of the soil. Naturally under such
drastic treatment the bacterial flora of the soil does not remain
unaltered; many species, in fact practically all those which do not
form spores, are entirely annihiliated. The very important group
of ammonia-producing organisms contains, however, very many
of the sporing kind, and the increased fertility of the soil is mainly
due to the increased production of ammonia. The nitrifying
bacteria on the other hand are destroyed, and on the belief,
current at that time, that the nitrogen of ammonia had first to be
converted into the form of nitrate before it could be utilized by
the plant, it was difficult to explain the increase in fertility. It
has been shown, however, that this belief had no real foundation
but that, in the absence of nitrates, plants can obtain their
necessary nitrogen in the form of ammonia and many other of
the simpler nitrogenous compounds.

As a medium for bacteria seems to be the result of the removal of an inhibitory factor which militates
against bacterial development. This factor in all probability, al-
though the hypothesis is not universally accepted, is the protozoal
launa of the soil. On this view, which is supported by the strongest
circumstantial evidence, though at the moment direct proof is lack-
ing, the protozoa living mainly upon bacteria keep down the
numbers of the latter within the limits stated above, and the removal or depression of the protozoa by partial sterilization results in a
corresponding enhancement of bacterial activity.

Methods have recently been developed at Rothamsted by which
the numbers of the different protozoa can be ascertained and the
interesting fact has come to light that encystment of the protozoa
takes place with rhythmic periodicity; certain species investigated
were found to pass through their entire life cycle from a period of
forty-eight hours, a phenomenon which has its parallel in the de-
velopment of the malarial parasite in the human blood. By counting
daily the numbers of protozoa, active and resting, and relating these
numbers to the condition of the soil, it has been found that the
bacterial numbers vary inversely with the numbers of the trophic
amoebae.

The effect of partial sterilization upon the fertility of the soil is
such that it has become a common practice and a paying proposition
for the nurserymen in the cucumber- and tomato-forcing industries
to sterilize their soils either annually or every second year. The
bacterial numbers are thereby reduced and the growth of the crops
in the few years the soil reverts to its former degree of productivity, and
in some cases shows, after the initial enhancement, an actual re-
covery of fertility. These facts are most easily explained on the cur-
rent hypothesis as set forth above. Much attention has been
accrued upon the subject in 1921, and very interesting results were
being obtained by the workers at the Rothamsted station, results
which bid fair to revolutionize accepted views so that the future
might well produce a theory more in accordance with the facts.

Nitrogen.—It has been recognized for some time that the nitrogen-
fixing organisms of the soil are physiologically dependent for their
energy upon carbohydrates, and that the amount of atmospheric
nitrogen they are able to fix bears a close relationship to the amount
of carbohydrate material used up. It was demonstrated in 1915 that
the nitrogen content of the material fixed was always 16 percent of the
amount of simple soluble nitrogenous compounds in the soil solution;
urea, glycocoll, formamide, etc., had a marked effect in depressing
the amount of nitrogen assimilated. These results have been fully
confirmed and it is now the general idea that whatever the form of the
soluble nitrogenous matter is present the organisms will make use
of this source in preference to that of free nitrogen, for which a
greater expenditure of energy on their part is required.

It is only in recent years that the energy relations of soil bacteria
have received due consideration; in 1916 it was pointed out that
Bacillus mycoides, a typical member of the group of ammonifiers,
fixes ammonia, not as an energy storage but rather in virtue of its power of obtaining energy from the protein
decomposition. If other sources of energy are available, e.g., carbohydrates,
these will be drawn upon in preference to the protein molecule with
the result that the ammonia production will be smaller. Hence, the
presence of much carbohydrate the proteins will be entirely neglected
and the organism will utilize the ammonia present in the soil as its source of nitrogen, thus competing with the growing crop.

It is only recently that the idea that bacteria are capable of forming
industrial amounts of ammonia under the controllable and suit-
able conditions of assimilating ammonia. The process has not been
observed in soils poor in organic matter, but in peaty soils it has
been demonstrated to the extent of some 300 of the added ammonia.

Obviously then, in the use of farmyard manure, the proper ratio
of carbohydrate to protein material is of considerable import-
ance. If the amount of carbohydrate is in large excess, most of the
ammonia absorbed by the plants will be utilized to produce ammonia already existing in the soil; at the same time under these
circumstances, provided the temperature conditions are satisfactory,
the nitrogen-fixing organisms will work energetically. The effect of a temporary shortage of fermentable matter will usually
mean that the nitrogen fixed will become beneficial to the growing plant.

If the material is particularly rich in protein the organisms will
produce considerable quantities of ammonia and the effect will be
at once beneficial.

If the air supply is insufficient the organisms will tend to produce
denitritification, taking some of their oxygen from the nitrates and
liberating nitrogen as gas. It has been shown that dressings of
farnyard manure may in exceptional cases do more harm than good.

Symbiotic Nitrogen Fixation.—At the commencement of the
decade the application to the soil of cultures of Pseudomonas riz-
cicola was advocated as a means of improving the crops of legumi-
 nous plants. As far as the soils of the Old World are concerned hopes
of such improvement have been shattered by experience; its soils
are not sufficiently heavily infested with the nodule organisms
needed to inoculate them with any more is merely a case of “bringing
coals to Newcastle.” In the New World virgin land exists which has
never carried leguminous crops; here inoculation with pure cultures of
the soil bacteria met with considerable success. Having the point
of view the study of symbiotic nitrogen fixation has lost much
of its interest, in its academic aspects it still retains undiminished
the allure, and the object of the organism investigated and it has transpired in cross-inoculation experiments
that several strains of the organism exist. Based upon trials made
by various investigators the nodule organisms are separable into
two main classes, one forming without delay to their inoculation the
various leguminous plants. Thus in one group fall the organisms
from all the true clovers, species of Trifolium; in a second those
from broad beans, pea, vetches, sweet pea, etc.; in a third those
Phellodendron; in a fourth those from broad beans and lucerne which
have been the most extensively tested with and without inoculation
with these having been effected. It is also of great interest to find that on inoculation into animals a reaction occurs, agglutinins being produced which are
BACTERIOLOGY

specific for the groups as determined by cross-inoculation. By culture methods also the occurrence and different degrees of a show marked differentiation. Three distinct groups can be made with reference to the rate of growth on artificial media, stickiness of the culture and opacity of the colonies. All these facts form perhaps the most important base for the breeding of bacteria of the nodule-producing bacteria. In numerous other characteristic, however, these organisms are so much alike, and as a whole they differ so widely from the specific bacteria, that it seems more convenient to regard the adapted forms as varieties of the single species *Pseudomonas radiocida*.

Symbiotic nitrogen fixation has been found to occur in plants other than those of the Leguminosae order. One of the best known is the *Azorhizobium* of the legumes of the *Rubiaceae* and *Myrsinaceae*, which were formerly believed to contain protein crystals, have been shown in reality to consist of colonies of bacteria living symbiotically with the plant cells, receiving from the plant nutrients and giving to the plant in return its nitrogenous by-products. The organisms have been shown to contain a specific nitrogenase in amount sufficient to solve all of combined nitrogen. Their relationship, if any exist, to *Pseudomonas radiocida* has not yet been determined. These bacterial glades have been found in a number of plants, including *Passion, Psychotria, Kraussia* and *Argemone*. They seem to be as closely wrapped up with the well-being of the plants as the root nodules of the *Leguminosae*; the organisms are present in the slime between the young leaves before the opening of the leaf. They are found in the leaves of the bean plant between the leaf and the embryo. Their introduction to the seed takes place at the time of fertilization, the pollen tube conveying them from the stigma to the ovule. The successful penetration of the surfaces impenetrable to the opening of the buds, the ordinary water pores of the leaf usually functioning as the ports of entry. In the cases of *Passion* and *Psychotria*, however, where the glades appear on the lamina of the leaf, they have been described as the destruction of the plant for the reception of the bacteria. This pore is of exceptional size as compared with the ordinary stomata of the leaf, and is said to be filled in by growth of the surrounding tissue after its function has been fulfilled.

The benefit derived by the host plants from the presence of their guests has been clearly demonstrated by seedlings raised from bacteria-saturated seed: the average of the growth of the seed—sterile and inoculated and cultured fertilized with potash and phosphorus but no nitrogen compounds. The plants grown in the inoculated cultures flourished and possessed typically green leaves while those grown in sterile sand showed all the signs of nitrogen starvation and soon died off.

**Cellulose Fermentation.**—The classical investigations of Omelianski showed that the cellulose of plant remains was decomposed under anaerobic conditions giving rise to marsh gas and hydrogen. This knowledge, however, does not help towards an explanation of the rapid destruction of plant residues in ordinary cultivated soils where conditions are mainly aerobic. It is well recognized that the loss soil the more rapid is the destruction of carbohydrate material. It is generally supposed that fungi play an important part in these processes and many species of moulds and actinomycetes have been shown to be efficient decomposers of cellulose. Later workers have invented cellulose media upon which the bacteria can be cultivated, and have succeeded in isolating several species, *Bacillus rossii, B. Amylolyticus, Bacterium flavens* and some fifteen others which have been described as bacteria of the conversion of lignaceous inorganic carbon. All these organisms are morphologically and physiologically distinct from Omelianski's hydrogen and methane organisms and grow well on ordinary gelatin media. The most powerful oxidizer of cellulose, however, is an organism discovered at Rothamsted in 1919. It is a peculiar organism exhibiting two distinct morphological characters at different stages in its life history, a long sinuous threadlike form and a large round "sporulated" form; it seems rather to be related to the spirchaelates than to the true bacteria and has received the name *Spirchaelata cytophaga*. It is an obligate aerobic and rapidly attacking cellulose, though it has no power of fermenting other substances. It is a fact that the addition of sugars to the reducing sugars, strongly inhibits its action upon cellulose. Like the nitrifying bacteria it cannot be cultivated upon ordinary nutrient media containing proteins, 0.25% of peptone being insufficient even to prevent growth. The products of decomposition of cellulose consist of a mucilaginous substance, small quantities of fatty acids and a yellow pigment allied to carotin. The discovery of this organism helped to show the fallacy of presuming that cellulose residues are important for the manure of the land, a great achievement in these days when motor traction has so reduced the available supply of this universal fertilizer. Moreover, the substitute has a considerable advantage over the raw product since the carbon-nitrogen ratio can be perfectly controlled.

**Sulphur and Phosphorus Cycles.**—Considerable attention has recently been given to the conversion of inorganic sulphur into organic forms present in the proteins of plant and animal residues in the soil; by series of bacterial reactions, forming complete cycles, these elements pass from their combination in the protein molecule into the forms of sulphates and phosphates, and so become taken up and, once more, elaborated into the organic constitution of the plant. It is thought that the use of sulphur in this way is sufficient for the optimum growth of crops. This assumption was based upon the low sulphur content of plant ash; recent investigations have shown, however, that as much as 90% of the sulphur is removed by the crop from the soil and that the process of sulphur removal by the crop is now a factor to be considered, and it has been shown experimentally that sulphur may become the limiting factor for plant growth.

Further, the sulphur and phosphorus relations in the soil are considered to be interrelated to the extent that the insoluble rock phosphates is rendered soluble by the action of sulphuric acid produced in the process of the decomposition of the sulphurizing bacteria in the process of the decomposition of the sulphurizing bacteria. Pot experiments have shown that the application of sulphur as a fertilizer together with rock phosphate tends to increase the availability of the phosphate; the evidence at present is that the rate of decomposition of the sulphurizing bacteria is so great that any material profit is to be gained by this method of fertilization.

**Sewage Disposal.**—The purification of sewage by the aerobic bacteria is normally contained in it so slow, requiring very many days for completion, that sewage disposal by this means alone has long been regarded as impracticable. A method of hastening the process was, however, discovered in 1913, and since 1916 the AC treatment. The results obtained from the advanced sludge process in operation at Manchester show a yield of nitrogen per annum approximately equal to the total faecal nitrogen of the sewage treated, whereas in the older method much of this and all the urine nitrogen escapes in the effluent in the form of nitrites.

It has been stated that fixation of atmospheric nitrogen actually occurs in the process; from what is now known of the energy relations of the bacterial process it seems probable that the amount of nitrogen fixation in a medium where the quantity of soluble compounds is large: in relation to the quantity of carbohydrate material seems very doubtful. It is more probable that the bacterial process has a purely physiological effect, which in the older process of sewage disposal becomes converted into soluble nitrates. As at present produced the amount of nitrogen in the dry sludge is about seven per cent. If by any means this can be increased to about 10% and if economical methods of drying the sludge can be found there is a great commercial future for the process. As it is, around Worcester, England, where by the activated sludge process is being disposed of and from which an effluent requiring no filtration is run away. Any excess of sludge over and above that required to maintain the necessary quantity of 25% to 30% in the tank is suitable for drying and direct application to the land.

The percentage of nitrogen in the activated sludge is considerably higher than that of the sludge from the sedimentation and septic tanks of the older and more usually employed method of sewage treatment. The results obtained from the activated sludge process in operation at Manchester show a yield of nitrogen per annum approximately equal to the total faecal nitrogen of the sewage treated, whereas in the older method much of this and all the urine nitrogen escapes in the effluent in the form of nitrites.
man and animals. No explanation for these interesting morphological differences has hitherto been advanced, and if any significance is to be attached to them it has yet to be discovered.

In the case of the parasitic fungi of cultivated plants, the parasitic organism and makes the distinction between parasitic and saprophytic forms is entirely unknown. One naturally asks whether an organism that may produce so many serious troubles and hence may be so harmful to be regarded as an enemy of a plant and to which it is the specific or known pathogenic organism. For this reason it seems likely that the parasitic organism is a common saprophyte in the soil and merely chance in some cases with the help of a favorable environment is capable of causing disease. It is also possible that the parasitic organism is a saprophyte in the normal phases of disease in the susceptible host and that in the case of certain species of plants it has become specialized for the production of disease in the susceptible host.

The effects of bacteria upon the attacked plant are by no means so straightforward a diagnosis of the disease as are the effects of bacteria upon the host. The specific symptoms in disease in a plant in which the general practitioner is enabled to diagnose his case with confidence are rare, and it is very likely that the rudimentary knowledge of bacteriological technique, which has no counterpart in the diseases of plants. The plant pathologist must first isolate and identify the causal organism, often a task of considerable difficulty. In the case of many of the diseases produced by a number of different organisms being essentially identical. According to these groups symptoms the bacterial diseases of plants may be divided into four main types, namely:

1. Soft Rot.—The plants most attacked by rot-producing organisms are the root vegetables and potatoes. A certain amount of disease may occur when the plants are still in the ground, but the losses take place during storage of the roots through winter. The rot results through the water of the succulent, the middle lamella, which holds the cells of the plant tissue together just as the wood of the tree binds the annual rings. The succulent substance consists of pectin material and its solution is effected through the agency of an enzyme, a pectinase, produced by the bacteria. The removal of this substance causes the tissue to lose all cohesion and the cells to become reduced to a watery pulp mass.

2. Wilt.—A number of very destructive diseases is included under this head. The symptoms are almost identical in all cases and are the result of the blocking up of the conducting system of the plant by bacterial excreta or similar substances. Parts of the plant whose natural supply of water is thereby cut off, die from wilting, and become the prey of all kinds of bacteria from the soil and air, and finally either dry up or become reduced to a wet rotting mass. Other parts of the plant become generally dwarfed and the attacked plants, and a one-sided growth of the plants resulting from a one-sided localization of the infection. The stripping of the leaves and other solanaceous plants, including tobacco whose cultivation in parts of Malay and other districts has had to be entirely abandoned as the result of this disease.

3. Anthracnose Diseases.—Here the disease takes the form of large or pseudo-cancerous growths on the stems and leaves of the attacked plant caused by hyper trophy of the cortical tissues and a consequent formation of a growth of cells which are the presence of the invading organism. Crown Gall, a de stuctive disease of roses, grape vines, hops and a large number of other hosts, belongs here. In the case of many of these cases, where it extends from year to year, eventually growing to such a size that death of the tree results through destruction of the conducting tissue of the root. Another disease of this type is the Olive Rust which produces galls on the leaves of the Olive tree.

4. Local Lesions.—Local lesions or cankers result through destruction of the external tissues of plants in localized areas upon the stems, leaves and fruits. Strip disease of tomatoes is well known to agriculturists. In the Citrus fruit is a serious disease of the leaf. In the case of citrus the disease is carried by some biting insect, attacks upon this carrier have resulted in more or less successful control. A case in point is that of the wilt of cucumbers, where the organism is transmitted on the hands of the carrier. In this case it is found that the beetle has a natural predilection for the wild squash, and by cultivating these insects in drills between the rows of cucumbers almost all the beetles can be collected upon them, where they can be periodically annulled by spraying with kerosene. Another means of control is found in the manural treatment of the soil whereby a more hardly and resistant plant is produced. In this way the increase of potash it has been possible to effect a considerable reduction of the Striped disease in tomatoes. The treatment of crops, so that several years elapse before a crop which has been diseased is again grown on the infected soil, is for the majority of bacterial diseases. This is especially the case with the parasites, not finding its particular host for some time, may die out or may become so altered physiologically as no longer to possess the power of attack upon the plant.

II. Medical Bacteriology

It has been more and more recognized by the epidemiologist that one of the chief structural units in the bridge which connects one outbreak of a disease with another is the carrier. By the term "carrier" is meant an individual who, though healthy and thus unsuspected of infectivity, still harbour in his body pathogenic bacteria which, passed in the various excretions, constitute, when given favourable circumstances, a danger to those about him. This carrier may be the sick one, but the individual, on the other hand, may continue to conserve and distribute the microorganisms for still longer periods—even many years.

Disease Carriers.—A certain number of bacteria pathogenic to man find carriers among animals, for instance the virus of Malta fever, which multiplies and is distributed in the milk of infected goats, but mainly man is himself responsible.

Aeolic lesions, which may be found on the soil around the sick animal, in the animal may be infected with the disease in question and failed to rid himself of the causative organisms, and then the infecting itself in his respiratory, genito-urinary or intestinal tract is capable of carrying the infecting organism normally found in those regions. He may, on the other hand, be an individual who entertains the bacterium without ever having displayed any symptoms of the disease. A chain of such carriers, recording no history of illness, but passing on the virus in secret, as it were, would be the explanation of sporadic cases, say, of cerebrosphinal meningitis, occurring in non-epidemic times, at
BACTERIOLOGY

widely distant and apparently unrelated places. In the same way, the seeds of a disease may be conserved over long periods from one eclipse.

That the carrying of pathogenic bacteria by either man or animals, together with the opportunity of their transmission to others, does not altogether explain the spread of disease is certain. A loss of virulence is a consequence of the invasion of an organism to the population, or both of these occurrences, must be assumed to explain the gradual spontaneous termination of an outbreak, and, similarly, the complete suppression of those phenomena must be regarded as parallels to the rapid and almost complete reversion of an epidemic.

The laws governing the loss or gain of virulence by bacteria are very imperfectly understood; even in the laboratory pathogenetic organisms, it is known that it is entirely possible for the initiation of a new strain and for the spread of disease to be accelerative, whereas the same bacteria, when used in the treatment of a group of patients who are in the same state as the original case, may resist the influence of the anthrax vaccine. Even though the carrier state is one which has so far shown itself recalcitrant to treatment, carriers can be, if circumstances warrant such an assumption, kept under observation. It is therefore recommended to adopt a course of life not likely to favour infection of others. To hasten or forestall the immunity assumed to occur in a community during the course of an epidemic is the object of prophylactic inoculation, a procedure of which the success has been further demonstrated during the World War.

Prophylactic Inoculation.—The compound anti-epidemic vaccine, which includes three typhoidal germs, B. typhosus, B. para
typhosus A and B, was universally employed in the British armies and was attended by excellent results, as witnessed by the following statistics.

The first cases in the British Expeditionary Forces in France up to May 1915 numbered 827. It was found that the incidence was 14 times and the mortality 42 times greater among the uninoculated than among the inoculated; up to August 1915 508 uninoculated had been reported, with 135.5% mortality. Similar good results attended the use of anti-typhoid vaccine in the armies of other belligerents. It clearly reduced the total number of cases and lowered the mortality rate. Only in Germany was doubt cast on the vaccine, but the number of cases was small compared with the number of preventive inoculations. A small body of opinion there considers that only by the use of a living virus, as in smallpox vaccination, can a really efficient prophylaxis be conferred. It is not without some of the critics that the Kolle vaccine, which is used in Germany, is of inferior immunising power, and certain pre-war statistics, comparing the use of this vaccine with one prepared by Vincent's method, bear this out.

Other prophylactic vaccines, the use of which has been attended more or less definitely by success, are those directed against cholera, plague, pneumoia, cerebrospinal meningitis and influenza. Tentatively used, because of its great toxicity, is the anti-dysentery vaccine.

Vaccine Therapy.—Other therapeutic employment of bacterial vaccines has been extensively adopted and has, according to some workers, justified itself in such widely different diseases as furunculosis, anthrax and whooping-cough. Much work has been done, unfortunately, corresponding success continues to be done with vaccine therapy in tuberculosis. It was hoped at one time that the advent of such new measures might be signified in the drop of the epidemic index, made during treatment, but the method has been discarded as not capable of furnishing a reliable guide to dosage, as was expected of it.

Septic Therapy.—Treatment by inoculation with serum specific for the disease in question has made notable advances. Besides those long in use in diphtheria, tetanus and streptococcal infections, sera capable of neutralizing the toxins produced by B. welchii, B. edematosus and V. septique, have been employed, as has also now been prepared. The efficiency of anti-meningococcus serum has been greatly increased by the recently acquired knowledge of the physiological activity of the meningococcus and by improvement of the antiserum. This is possible, in the use of more effective sera together with more rapid diagnosis generally, to lower the death-rate for cerebrospinal meningitis in the home forces from 65% in 1914, to 21% in 1918, and to show that the typhoid fever by which so many men were killed, was due to that strain of the meningococcus known as Type 1; it is against this type that the most potent anti-toxin is preparable. Other sera of which much has been attained by favouring blood is frequently sterilized against other organisms and applied to the anaerobes, which appear to possess a special property of not readily growing, unless associated in some numbers. For this reason, the anaerobic cultures which "take" are far more likely to be successful, and the death rate and impurity may pass undetected through a whole series of sub-cultures.

A more refined technique and a more meticulous criticism of results proved necessary and were applied during later investigation.

In the group of spore-bearing anaerobic organisms concerned with wound infections and apart from B. tetanus already well studied, it is the fact that it also existed mainly in impure culture in the laboratories, three outstanding pathogenic species have been set up:—

(1) B. welchii, the most frequently found of the gas-gangrene bacteria. In more than 40% of gangrenous conditions it is found, and its presence in conditions of impurity as B. aerogenes capsulatus, B. philogenium emphysemaetacut, B. perfringens, B. enterolitis sporogenes; (2) V. septique (Pasteur), the B. edematis maligui of Koch, and (3) B. edematosus, a highly toxic organism discovered by Weinberg and Seguin in 1915.

For all three, potent antitoxie sera have been prepared and the treatment of infected wounds has been greatly improved. In the case of closely pathogenic anaerobes such as B. bistolitesc are also concerned in the polymicrobial invasion of wounds, as well as a series of definitely non-pathogenic anaerobes, B. sporgenes. Some of these organisms, besides such symptoms as suppurative processes, are only in the roles of contaminating organisms, taking part no action in the morbidity process.

Epidemic Influenza.—To our knowledge of the etiology of this epidemic and world-wide epidemic of 1918, with its enormous incidence and with its appalling mortality returns, such as that of six millions for India alone, has brought in but an increase of uncertainty. Discoversies have been made during 1918, widely accepted as the cause of that disease. But the failure, during the last pandemic, of a large number of bacteriologists
to isolate the bacillus from a considerable proportion of the cases investigated, together with the fact that the disease could not be reproduced experimentally by means of seed organisms by artificial inoculation with Pfeiffer's bacillus, caused a revolt from the orthodox belief. It is considered by many that the primary aetiologic factor still remains unexplained, and some writers, like Schlesinger, Str. typhosus, and the Pneumococcus (the three pathogenic microorganisms most usually found associated with the disease), is but a secondary factor in the etiology of the disease. Moreover, even though of such malignancy as to be frequently fatal, the disease has not been shown as either a specific disease or as one which possesses the characteristics of a true causative organism in the strict sense of the term. The discovery of a cause for paratyphoid fever has therefore been the one great advantage in the campaign against this disease, and the isolation of the organism, either as a pure culture or in association with the original cause causans. Owing to their negative findings, a large number of bacteriologists have concluded that this must be placed in the class of diseases produced by filtrable viruses, organisms not to be seen with the aid of the microscope, or if so, not or barely to be seen; of so diminutive a size that they are capable of passing through the pores of even the finer porcelain filters. An account of these viruses, together with their discovery, is to be found in the case of B. suis. The virus here has been demonstrated to be a filter-passing organism.

From many parts of the world, by inoculation of the fluids, filtrates, or sera of patients suffering from such cases, a filtrable virus has been isolated, but in no case have they stood the test of criticism. With regard to the tiny globoid bodies shown in the filtered fluids, no evidence of their true infective nature or of their origin from an infective point of view was forthcoming. They have been considered to be inanimate particles of disintegrating protein or even ordinary contaminating bacteria gaining access to the culture tubes through blood contamination.

Those investigators who resent the attack on the orthodox belief in the B. influenzae as an aetiologic factor point out that not all who showed symptoms in their cases; that those employing more satisfactory media for the isolation of the growth of the bacillus were able to isolate it in as many as 90%. They further point out that an illness recognizable as influenza has not so far been transferred experimentally to monkeys as that it could be shown by inoculations with living B. influenzae are, they hold, supported by the observations that it has not been possible voluntarily to transmit the disease from one person to another, even by such drastic methods as the injection of the mucous membranes with the filtrates and secretions taken from the eyes, nose and throat of pronounced cases.

This paradoxical indication of a low infectivity of influenza is quite in keeping with the fact that vaccinated people have been carried out during and subsequent to the pandemic, whereas persons examined at the end of the epidemic, as normal, because of their not having succumbed to an attack of the disease, may be regarded on those very grounds as possessors of an immunity which, as far as we know, is certainly not being as acceptable as normal at all. More recently, experimental infection of both monkeys and man with influenza bacilli and the production of acute respiratory disease have been demonstrated, but the identity of the illness evoked with that of epidemic influenza is far from established. The whole question of the aetiology of influenza is still sub judice.

Typhus Fever.—Early in the war, in a number of the armies engaged in the Near East, an illness was noticed which, although it corresponded clinically in many ways with enteric, did not yield a virus agreeing with any of the three well-known organisms of that group. In 1913 a French observer, Plotz, showed that the agent was not an organism but a virus, which he proposed to call the typhus virus of Plotz and the Proteus X 10 of Well and Felix. Since that time, the virus has been found in the blood of patients suffering from typhus fever and from several other diseases, and is now regarded as belonging to the typhus group.

The term typhus has been applied to a group of fevers characterized by a syndrome common to many species of pathogenic bacteria. The fever was first recognized in the middle of the 19th century, when German observers distinguished typhus from paratyphoid fever. By 1886, both Rokitansky and Koch had discovered the bacillus causing typhus, which was named Rickettsia prowazekii. The disease was subsequently found to be caused by several related species, which are now called typhus bacilli. The term typhus is used for the disease caused by these bacilli, and the term typhus fever is used for the clinical syndrome caused by typhus bacilli.

The typhus group is characterized by a high fever, headache, mental confusion, and abdominal pain. The disease is usually transmitted by the bite of an infected tick. The incubation period is typically 7-10 days, and the disease can be prevented by tick control and vaccination. The treatment of typhus fever is supportive, and antibiotics are not effective in most cases.

In 1916 Ricketts and Weller described very small bodies seen in the gut oflice taken from typhus patients. In 1916 Röche Lichardout suggested that these bodies were bacilli and called them typhus bacilli. The problem of classification is that these bacilli are not seen in the gut of the lice, but are transmitted from the lice to the host. Against the complexity of other insects, such as the flea and the bed-bug, these bacilli are not transmitted through叮咬, but one transmitted for the main part through the agency of lice-bred lice.

In 1916 Ricketts and Weller described very small bodies seen in the gut oflice taken from typhus patients. In 1916 Röche Lichardout suggested that these bodies were bacilli and called them typhus bacilli. The problem of classification is that these bacilli are not seen in the gut of the lice, but are transmitted from the lice to the host. Against the complexity of other insects, such as the flea and the bed-bug, these bacilli are not transmitted through叮咬, but one transmitted for the main part through the agency of lice-bred lice.

Ricketts, being also, in 1909, the first to describe bodies of this nature in the tick which transmits the disease known as Rocky Mountain fever. The aetiological relationship of these bodies to typhus is being generally recognized. The aetiological factors in these similar bodies have been found where no typhus has been detected by the discovery of a different species, the Rickettsia prowazekii and the Rickettsia prowazekii of fever, and the assumption that, as there are a variety of Rickettsia species, they will be apathogenic for man. The causative factor is that of Plague and Plasmodium X, or Weil and Felix, and as little support is necessary for the idea that the agent may be regarded as the same as the latter. The evidence of the Rickettsia has been demonstrated for the destruction of the Rickettsia-containing lice and their excreta for human beings.

Yellow Fever and Infectious Jaundice.—A great deal of enlightenment was brought about on yellow fever during 1919-21 by the Japanese research worker, Noguchi, of the Rockefeller Institute. Previous to his investigations generally recognized the aetiological factors in this most dread disease of tropical regions rested on the courageous work of its attendant life performance by the Japanese Commission, which has been made in Japan. In 1900, yellow fever was first described in Central America, and in 1907 it was recognized that fever caused by the mosquito Stegomyia calamia was the cause. Other cases were reported from many other countries, including the United States and Europe. The disease was not, however, until the discovery of the yellow fever virus in 1930, that yellow fever was recognized as a disease caused by a virus transmitted by the mosquito. The virus of yellow fever is now called yellow fever virus. It is a filterable, cytoplasmic agent that is transmitted by the mosquito Aedes aegypti. The disease is typically characterized by a high fever, myalgia, headache, and jaundice. The incubation period is typically 5-7 days, and the disease can be prevented by vaccination with yellow fever vaccine. The treatment of yellow fever is supportive, and antibiotics are not effective in most cases.

Wassermann Test.—Among laboratory diagnostic methods of a serological character, the Wassermann test is the test for the detection of syphilis. The infection is characterized by the formation of antibodies, which are detected in the blood. The test is performed by injecting the suspected blood into the body of a guinea pig, and measuring the amount of antibody produced. If the Wassermann test is positive, it indicates the presence of syphilis. If the test is negative, it indicates the absence of syphilis. The Wassermann test is a simple and reliable method for the diagnosis of syphilis, and it is widely used in clinical practice. However, the test is not 100% accurate, and it can give false positive or false negative results. Therefore, it is important to interpret the results of the Wassermann test in conjunction with clinical symptoms and other diagnostic tests. The Wassermann test is not useful for the diagnosis of other sexually transmitted infections, such as gonorrhea and chlamydia.
Agglutination Test.—A serological test which has undergone some development in recent years is that of agglutination. It has been applied successfully to distinguish certain strains of bacteria by agglutination. When an agglutinating serum has been prepared by inoculating an animal with one species of bacteria, it is found that the serum is capable, not only of agglutinating that species to a high degree, but also of agglutinating other closely related species (group or co-agglutination), and this sometimes to practically the same extent as it does the homologous species. It has been observed that an organism isolated from an individual infected with some other quite alien, bacterial species will have acquired, more or less temporarily, the property of agglutinating with serum specific to that alien infecting species. This is called paragglutination. Perhaps the most curious of the paragglutination character has been to see a more than a temporary acquisition.

Absorption Test.—To distinguish between specific and non-specific type of agglutination, a modification of the agglutination test is employed—the absorption test. It is found that, after complete absorption of a serum with its own specific species, all agglutinins have been removed. When a co-agglutinating species is employed only the specific agglutinins will be absorbed, leaving the species agglutinin remaining intact. By this means it has been possible to discriminate between closely related strains and to divide species into a variety of groups.

Schick Test.—Valuable aid in combating diphtheria epidemics is afforded by the Schick test. This supplies a criterion of the immunity possessed by the individual. A solution of diphtheria bacillus is injected into the skin of the subject and is carried out by the injection of a small quantity of diphtheria toxin into the skin of the person tested. If the individual possesses immunity the toxin is neutralized and no reaction in the tissues above it occurs. If there is no immunity the toxin sets up a small inflammatory condition which is easily recognizable. The practical application of this measure lies in the prophylaxis of diphtheria, a method of prophylactic agglutination against pneumonia, as carried out so extensively by Lister on South African miners, it was seen to be very essential that the type predominant should be outstandingly represented in the vaccine used, for in a large number of meningitis cases it is necessary for the best results that the type of pneumococcus and meningococcus concerned should be known and a corresponding antiserum administered. When dealing with B. tetani, on the other hand, the importance of distinguishing between the various agglutinatory and absorptive types does not maintain; an identical toxic element appears to be common to them all, so that one anti-toxin serves for whatever type may be responsible for the infection.

Baden, Free State of (see 3, 184).—The population of the Free State of Baden, Germany, was, according to the census of 1919, 2,208,503.

Political and Constitutional History.—Baden was, till the revolution of 1918, a constitutional monarchy; the sovereign bore the title of Grand Duke. The Diet (Landtag), which was composed of two Chambers, had indeed the right of legislation and of voting taxation, but the ministers were appointed by the Grand Duke at his own discretion. The government had always been conducted in a liberal spirit; Baden had in Germany the reputation of being the model of a diminutive Liberal country (ein Liberal-Staatlein), though the population was preponderantly Catholic. There was certainly a powerful Clerical minority in the second Chamber of the Diet. When at a general election there was a danger that a Clerical-Conservative majority would be elected, the two Liberal parties (the National Liberals and the Progressists) concluded an alliance for election purposes with the Social Democrats, thus constituting the so-called "grand bloc." The result was that the Social Democrats held a considerably different position in Baden from that which they occupied in the empire.

In Baden, too, the line was drawn as allowing Social Democrats to become members of the Government. The Social Democratic party nevertheless endeavoured to place as few difficulties as possible in the path of the Government, and it did not, as elsewhere, vote against the budget. When the World War broke out in 1914, the leader of the Baden Social Democrats, Ludwig Frank, at once enlisted as a volunteer and fell in one of the earliest battles.

The Liberal sympathies of the Baden dynasty were maintained during the war. The heir to the throne, Prince Max of Baden, tried to exercise his influence in favour of a peace by any means possible. In the case of prophylactic inoculation the meninogoccus, the dysentery and paratyphoid B groups. The recognition of the existence of different types of pneumococci and meningococci has proved of great importance for diagnostic, prophylactic and therapeutic reasons. In the case of prophylactic inoculation against pneumonia, as carried out so extensively by Lister on South African miners, it was seen to be very essential that the type predominant should be outstandingly represented in the vaccine used, for in a large number of meningitis cases it is necessary for the best results that the type of pneumococcus and meningococcus concerned should be known and a corresponding antiserum administered. When dealing with B. tetani, on the other hand, the importance of distinguishing between the various agglutinatory and absorptive types does not maintain; an identical toxic element appears to be common to them all, so that one anti-toxin serves for whatever type may be responsible for the infection.

Schick Test.—Valuable aid in combating diphtheria epidemics is afforded by the Schick test. This supplies a criterion of the immunity possessed by the individual. A solution of diphtheria bacillus is injected into the skin of the subject and is carried out by the injection of a small quantity of diphtheria toxin into the skin of the person tested. (H. L. H. S.)
BADENI, KASIMIR, Count (1846-1900), Austrian statesman, was born Oct. 14 1846 at Surachovo in Galicia, his family being of Italian origin. He studied law and served some years in the Ministry of the Interior and from 1879 at Cracow as lieutenant of the governor of Galicia. He refused the Government service in 1886, but two years later was appointed governor (Statthalter) of Galicia, where he ruled the Ruthenians with a strong hand. In Sept. 1895 he was appointed Austrian prime minister, and his attitude was at first satisfactory to the German-Austrians. In 1897, however, in order to gain the support of the Czechs for the new Ausgleich with Hungary, he made certain important concessions in respect of the official use of the Czech language in Bessinia. This was done by ordinance, without parliamentary sanction, and met with violent opposition from the German deputies, some of whom were imprisoned. The form of influence aroused, among the German-Austrians by this policy, which led to imposing demonstrations in the streets of Vienna, led to Badeni's downfall on Nov. 28 1897. He died July 9 1909.

(B.C.B.)

BADOGlio, PIETRO (1871- ), Italian general, was born at Grazzano (Alessandria) Sept. 25 1871. He received his commission in the artillery, and thence passed to the general staff. During the Italo-Turkish War he served in Tripoli on a mission receiving special promotion to major after the battle of Zazau. On Aug. 17 1917 he was promoted to lieutenant-colonel and on Italy's entry into the World War he held the post of sub-chief-of-staff of the II. Army under Gen. Frugoni. In quick succession he acted as chief-of-staff of the 4th Division, and commanded the 74th Infantry Regiment on Monte Sabatino. In July 1916 he received another step, and as colonel commanded the "Sabatino Sector." He planned and carried out the successful attack on Monte Sabatino which preceded the fall of Gorizia (Aug. 1916). For this success he was once more promoted. After serving as chief-of-staff of the Corps of the Cuneo Brigade, he became chief-of-staff of the so-called "Zone" under Capello, with whom he remained when the command of the "Gorizia Zone" was extended to the whole II. Army. On the eve of that army's offensive in May 1917, Capello, dissatisfied with the artillery preparation in the sector of the II. Corps, obtained the appointment of Badoglio as interim commander of the corps (May 17). After the capture of Monte Kuk and Monte Vodice this appointment was confirmed, and he received another step of promotion. He commanded the II. Corps at the beginning of the August offensive but when the XXVII. Corps was formed in the spring of 1918 the attack failed to make the progress expected he was sent to take over the corps. This time, however, the endeavour to make up for lost time was unavailing. At the battle of Caporetto, Badoglio commanded the same corps, the left wing of which was broken by Otto von Below's attack from the Tolmino bridgehead. On the reorganization of the Italian Supreme Command (Nov. 1917) he was appointed as one of the two sub-chiefs-of-staff then nominated, the other being Gen. Giarlando. From Feb. 1918, on Giardino's transference to Versailles, Badoglio acted as sole sub-chief-of-staff under Diaz. He conducted the Armistice preliminaries at Villa Giusti, and signed the Armistice on behalf of Italy. In Nov. 1919 he was appointed to the rank of army general and from Diaz's resignation to Feb. 1921 he was chief of the general staff in succession to Diaz.

Badoglio's rapid rise was explained by the qualities which he showed in a special degree: determination, energy, and thoroughness. These qualities, joined to a natural military instinct developed by much study and backed by a powerful ambition, marked him out early and brought him very quickly to the front. He was blamed in various quarters for his disposition of the XXVII. Corps before the Austro-German attack in Oct. 1917, but the Caporetto Commission of Inquiry rejected most of the criticisms made upon him.

BAEYER, JOHANN FRIEDRICH WILHELM ADOLF VON (1835-1917), German chemist (see 3.102), died at Munich Sept. 5 1917. Up to within a year of his death he continued in full active work as one of the best-known teachers in the world of organic chemistry.

Bagwell, Richard (1840-1898), Irish historian, was born Dec. 9 1840, the eldest son of John Bagwell, M.P. for Clonmel from 1857 to 1874. Educated at Harrow and Christ Church, Oxford, he was afterwards called to the English bar, but never practised. As a landowner in Tipperary he devoted constant and conscientious attention to local affairs, serving on all boards and committees until 1898 when, on the passing of the Local Government Act, his wide experience led to his appointment for many years as a special local government commissioner. In 1905 he became a commissioner for national education. As a historian his reputation rests mainly on his two works, Ireland under the Tudors (3 vols. 1885-90) and Ireland under the Stuarts (3 vols. 1909-16), which are monuments of careful research and wide learning. In recognition of his historical work he was given the hon. degree of Litt.D. by Dublin University in 1913 and that of D.Litt. by Oxford University in 1917. Mr. Bagwell was an uncompromising Unionist, and was well known as a speaker and writer for the cause. He died at Marlfield, Clonmel, Dec. 4 1918.

BAIRNSFATHER, BRUCE (1857-1936), English humorist, was born at Murree, India, July 9 1857, and educated at the United Services College, Westward Ho. He became a civil engineer, and also had some military experience in a militia battalion of the Royal Warwickshire Regt. In 1914 he rejoined this regiment and went to France, serving there until 1916, when he obtained a War Office appointment. Bairnsfather's reputation as an artist was made by his black-and-white sketches of life in the trenches, which first appeared in The Bystander. His soldier characters became popular and he made a play, The Better 'Ole (1917), founded on the adventures of "Old Bob," and his friends, enjoyed a great success. Many of Bairnsfather's drawings were published in various volumes entitled Fragments from France. He also produced Bullets and Bullets (1916) and From Mud to Mufli (1919). In 1910 he started Fragments, a weekly comic paper.

BAKER, GEORGE PIERS (1866-1928), American educationalist, was born at Providence, R.I., April 4 1866. He graduated from Harvard in 1887 and taught English there as instructor, assistant professor and, from 1905, as professor. His courses dealing with the theory of the drama were highly successful, and his famous laboratory, known as the "47 Workshop," afforded practical training for his students, many of whom became well-known playwrights. In 1919 he was entrusted with the preparation of a pageant to commemorate the tercentenary of the landing of the Pilgrims at Plymouth in the State of Massachusetts. This pageant, "The Pilgrim Spirit," was presented accordingly at Plymouth in Aug. 1927.

His works include Specimens of Argumentation (1893); Principles of Argumentation (1895); The Forms of Public Address (1906); The Development of Scholarship as a Dramatist (1897); Some Unpublished Correspondence of David Garrick (1927); The Correspondence of Charles Dickens and Maria Bradwell and Dramatic Technique (1919) and Modern American Plays (collected and edited with introduction, 1920).

BAKER, HERBERT (1862-1928), English architect, was born in 1862 and educated at Tonbridge school. He was articled to Arthur Baker, and later entered the office of Sir Ernest George, where he remained as assistant for some years. He studied at the R.A. schools, and in 1889 was awarded the

The end of the South African War saw Baker in full practice in the Transvaal and South Africa. In addition to the Government buildings at Pretoria—the administrative capital of South Africa—he carried out the cathedrals at Cape Town, Pretoria, and Salisbury, and many colleges and schools. Amongst the houses he built in South Africa are the Government House at Bloemfontein for Sir John L. Hope (1896), the Governor-general’s residence at Johannesburg, and many model mining villages on the Rand. His works in England include Sir Philip Sassoon’s house at Lympne and the restoration of Chiltem Castle, Kent. He was appointed one of the three principal architects for the war cemeteries in England and Flanders, and carried out many war memorials in England, amongst them those at Canterbury, Winchester and at Harrow School. Baker was appointed in 1913 joint architect for the new Imperial City of Delhi, in collaboration with Sir Edwin Lutyens. For this grand design he designed buildings for the secretariat, the Legislative Assembly, the Councils of State and of Princes, and the Viceregal’s building for General Assembly.

BAKER, NEWTON DIELH (1871— ), American politician, was born at Martinsburg, W. Va., Dec. 3 1871. He was educated at Johns Hopkins, A.B. 1892, and Washington and Lee (L.L.B. 1894). In 1896 he became private secretary to Postmaster-General Wilson, but the following year opened a law office in his native town. Later he moved to Cleveland, O., where in 1902 he was made city solicitor and in 1912 mayor. The latter office he held for two terms when in 1916 he was appointed U.S. Secretary of War by President Wilson. He had declined the Secretariatship of the Interior in 1912. After the outbreak of the World War he endorsed the Administration’s peace policy, supported the League to Enforce Peace, and urged that the national guard be tried fully before compulsory service be decided upon. After America entered the war he recommended moderation towards conscientious objectors and forbade men in uniform to interfere with anti-conscription meetings. The charge of pacifism was often brought against him, and his career generally as Senator, in contrast to that of his predecessor, was marked as lacking in energy, foresight and ability, and especially for his failure to prepare adequately in the months immediately preceding the American declaration of war.

BAKST, LEON NICOLAIevICH (1866— ), Russian painter and theatrical designer, was born at St. Petersburg May 10 (April 27 O.S.) 1866. He was educated at St. Petersburg, where he afterwards studied art, and later went to Paris, subsequently returning and working in Moscow. In 1906 he settled in Paris, and soon became popular as a designer. In 1909 the Imperial Russian Ballet first visited Paris, and Bakst at once leapt into fame through his designs for the setting of the ballets Scheherazade and Cléopâtre, followed in 1912 by L’Après-Midi d’un Faune, Hélène de Sparte, and St. Sébastien, and in 1913 by La Pâissia. He published in 1913 an article in La Nouvelle Revue, entitled “Les Problèmes de l’Art Nouveau.”

See L’Art décoratif de Leon Bakst, with appreciation by Arsène Alexandre, translated by H. Melvill (1913).

BALAKIREV, MILI ALEXEIVICH (1836—1910), Russian musical composer (see 3.234), died at St. Petersburg in May 1910.

BALDISEREA, ANTONIO (1838—1917), Italian general, was born at Padua 1838, and died at Florence, on Jan. 9 1917. His birthplace in 1838 being still under Austrian rule, young Baldissera entered the Austrian army, in which he served with distinction in an infantry regiment; he was captain in the 7th Jagiers at Custozza (1866). But when Venetia became Italian, he opted for Italian nationality, retaining his rank in the Italian army. In 1870 he was promoted colonel of the 7th Jagiers and was sent to Eritrea under Gen. Asinari di San Marzano, remaining in the colony as governor after the latter’s return. Both as a soldier and an administrator he showed high qualities. He occupied Asmara, Kerien and other territories, defeated the armies of Ras Alula, and had planned still further extensions of Italian dominion, profiting by the anarchy of Abyssinia. He organized the admirable native troops (Ascari), developed agriculture and built roads. But owing to a disagreement with the home Government over his Abyssinian policy he asked for and obtained his recall after two years of successful activity. In 1892 he was promoted lieutenant-general. When war with Abyssinia broke out in 1895 the then governor of the colony, Gen. Baratier, did not enjoy the confidence of the Government, which decided to send out Baldissera once more. Although the appointment was kept secret, Baratier got wind of it, and this probably decided him to attack the enemy with an inferior force and insufficient supplies, hoping to win glory for himself before his successor’s arrival. The result was the disaster of Adowa (March 1 1896); when Baldissera arrived he found a defeated and demoralized army, and the victorious enemy advancing in force. With lightning speed he reorganized the remains of the army and the reinforcements which had just landed; he belied the beligerated garrisons of Cassale and Adigrat, drove back King Menelik’s army and reoccupied a large part of the lost territory. But peace was concluded before he had completely retrieved the defeat of Adowa, and he was forced to limit his activities to the internal reorganization of Eritrea. But even this task he could not carry out as thoroughly as he wished owing to the opposition of the home Government, which was too tired of African affairs. In 1897 Baldissera returned to Italy and resumed his duties in the home army, successively commanding the VII. and VIII. Army Corps. In 1906 he was made a Baratier. In 1908 he had to retire from the army under the age limit.

BALFOUR, ARTHUR JAMES (1848— ), British statesman (see 3.250), was confronted, as Conservative leader, after the general election of Jan. 1910, with a situation of some embarrassment. He had to endeavour to save the effective authority of a second Chamber and to avert Irish Home Rule, with his supporters not yet completely united on the issue of Tariff Reform, and in face of a Liberal Ministry dominated once more by a body of 80 Irish Nationalists, who held the balance of power in the House of Commons, and was not likely to be disposed to the Irish Home Rule because, as a Liberal, he was averse to any form of Home Rule. Asquith announced that, if he could not secure statutory effect for his policy in that Parliament, he would not dissolve except under conditions which would ensure that the will of the people should be carried into law in the next Parliament, he exclaimed that the Prime Minister had “bought the Irish vote for his Budget, but the price paid is the dignity of his office.” In the lull in the party fight which followed the death of King Edward,

Mr. Balfour welcomed the suggestion of a conference between the parties to endeavour to arrange a compromise, and was one of the eight leaders who met on 21 occasions between June and Nov. without coming to an agreement. When the
conference failed and ministers announced another dissolution, Mr. Balfour did his best to round the country to the dangers which, in his view, threatened it. In a speech at the Albert Hall he expressed his readiness to submit Tariff Reform to a referendum, and maintained that the Government for their part should be ready to submit Home Rule also to a referendum. The offer was not accepted. When the second general election of 1910 confirmed the verdict of the first, the dissatisfaction with Mr. Balfour’s leadership, which had been long entertained by a considerable section of the Unionists, began to spread. It was pointed out that he had now led the party to three electoral defeats in succession; and this was confirmed by Balfour’s Resolutions of 1886, 1890, and 1900. The course of the session of 1911 intensified this dissatisfaction. Mr. Balfour did indeed fight the Parliament bill, in its passage through the House of Commons, with courage, persistency, acuteness and passion. While he admitted the need for some change in the Constitution, and promoted Lord Lansdowne’s measure for reconstituting the House of Lords and making it a Chamber partly hereditary, partly nominated, and partly elective, he denounced the Ministerial bill as practically constituting single-chamber government. Ministers, he said, were being permitted to change the country by coercion as they had imposed them on the country by fraud. In committee he strove hard, but in vain, to get fundamental laws exempted from the operation of the bill. But he shrank, as in 1832 the Duke of Wellington had shrank, from encouraging the House of Lords to persist in opposition, when ministers announced that they had obtained the King’s consent to the creation of sufficient peers to make its passage certain. He did indeed move a vote of censure imputing to ministers a gross abuse of the Constitution in the advice they had given to the Crown; but he declared that he would stand or fall with Lord Lansdowne in the recommendation which the latter made to the Unionist peers to abstain from further resistance as being no longer free agents. This attitude was passionately resented by a large number of “Diehards,” who organized themselves under the leadership of Lord Halsbury, and with the approval of Mr. Joseph Chamberlain, then in retirement owing to illness. Mr. Balfour’s counsel prevailed, and the bill was allowed to pass; but his position and authority as leader had been seriously shaken. Though both he and leading “Diehards,” in speeches in the autumn, treated the dispute as ancient history, he declared that he was prepared to resign, if necessary, as the leader of the leadership, to resign; and he announced his decision to a meeting of the Conservative Association in the City of London on Nov. 8. He said that he desired to abandon his heavy responsibility before he could be suspected of suffering from a sort of pettifaction in old courses and inability to deal with new problems: and that he felt he had not the vigour, at his time of life, again to conduct a ministry. He treated the unrest in the party as nothing exceptional, and spoke of Unionism as on the upward grade. The announcement, in spite of the signs of discontent, came as a great shock to the party and the country; and the Prime Minister, Mr. Asquith, himself expressed the general feeling when he said at the Guildhall banquet next day that the resignation involved an irreparable loss to the daily life of Parliament.

Mr. Balfour was then only 63, and his powers as a parliamentarian were really at their height. Although after his resignation of the Unionist leadership he devoted more time to his manifold other interests in life—philosophy, science, literature, music—he still took at intervals a prominent part in debate, and made occasional speeches in the country, giving throughout a loyal support to his successor in the House of Commons, Mr. Bonar Law. The renewed controversy on Home Rule afforded him a great opportunity, and the powerful series of speeches which he delivered, at Westminster and elsewhere, in the course of the next three years, did much to awaken Great Britain to the imminent danger of civil war in Ireland, and to force ministers into the policy of excluding Ulster, in some form or other, from the operation of their bill. When the World War broke out he cordially accepted the policy of the Unionist leaders in sinking all political differences in support of the national Government. Speaking at the Guildhall on Lord Mayor’s Day 1914, he said that the Allies were fighting for civilization and the cause of small states, and, whether the war was short or long, they would triumph. In this spirit he joined the first Coalition Government in May 1915, accepting the first lordship of the Admiralty under Mr. Asquith: and from this time onward he took a statesman’s share in the conduct of the war, and in the making of peace. The Admiralty had been distracted by a quarrel between Mr. Churchill, the First Lord, and Lord Fisher, the distinguished admiral, who was then the First Sea Lord. Mr. Balfour had appointed an eminent scientific sailor, Adm. Sir Henry Jackson, as First Sea Lord, and speedily restored the harmony of the Board. He also reversed Mr. Churchill’s policy of differentiating against prisoners from submarines as compared with other German prisoners, though he insisted that there was no change of opinion as to the unlawful, manly, cruel, and brutal character of their acts. In introducing the Navy Estimates in 1916 he said that, except in armoured cruisers, the fleet was far stronger than when war broke out; that ships, guns and aeroplanes had increased, and that the personnel had more than doubled. His pointing at crucial Mr. Churchill, who averred that the existing Board had not so much energy, speed, push and drive as his own, and who, to the astonishment of the House, recommended the recall of Lord Fisher—a suggestion upon which Mr. Balfour commented severely. Perhaps the best work which he did at the Admiralty was the issue, at intervals, of some cogent papers, mainly for the benefit of the Americans, vindicating the great work of the British navy in the war, and exposing the fallacies involved in the captivating phrase, “the freedom of the seas.” The chief naval battle of the conflict, the battle of Jutland, was fought during his term of office; and he incurred widespread criticism by the manner in which the news was officially communicated to the public, the great losses in men and ships being dwelt on to such an extent as to suggest that, instead of being a victory, the action was a defeat. In a speech a few days later he claimed that, as a result of the fight, the Germans were relatively far inferior to what they had been. In late Oct., there was a daring German raid by 10 destroyers into the English Channel; an empty British transport and one British destroyer were sunk, and another destroyer seriously damaged; and it was confidently predicted at the Guildhall on Lord Mayor’s Day that any further Channel raiders would suffer disaster. His confidence was probably based in part on a new arrangement of the high naval appointments, which he announced before the end of November. Sir John Jellicoe was brought into the Admiralty as First Sea Lord, and Sir David Beatty was appointed to succeed him as commander-in-chief. These changes were promptly followed by a change of First Lords when Mr. Lloyd George formed his Ministry in Dec. 1916. Lord Grey of Falloch declined to continue at the Foreign Office under the new Prime Minister; and as it was essential to have a man of experience and weight there, the post was pressed upon Mr. Balfour, who had in times past occasionally acted as Foreign Secretary in Lord Salisbury’s absence, and had been intimately associated, during his Premiership, with Lord Lansdowne’s work in the department.

Mr. Balfour took up his new duties as Foreign Secretary only a few weeks before Germany instituted the unrestricted submarine warfare which brought the United States into the war; and in April 1917 he headed a British mission which visited America in order to arrange for regular cooperation between the two countries. His attractive personality greatly impressed his hosts, and he received the compliment of being invited to address the House of Representatives on May 5; his speech showed a complete sympathy, that was highly appreciated, with the spirit in which the United States had entered the war. He subsequently proceeded to Canada, and there addressed the two Houses of Parliament. The concentration of power in the
hands of the War Cabinet, and the great personal ascendency which Mr. Lloyd George, as Prime Minister, rapidly acquired, both tended rather to reduce the importance of the Foreign Secretary during Mr. Balfour's tenure of the post. It should be noted, however, that it was Mr. Balfour, as Foreign Secretary, who in Nov. 1917 gave a promise on behalf of his Government to provide a "national home" for the Jews in Palestine after the war. The exceptional amount of work to be dealt with at this period impelled him to ask for extra help in the office; and the Robert Cecil was taken from the Ministry of Blockade in the summer of 1918 and made an assistant Secretary of State. Mr. Balfour went to the Paris Conference in 1919 as the second British plenipotentiary; but as eventually the terms of peace were settled by a council of three, Mr. Wilson, M. Clemenceau, and Mr. Lloyd George (or of four, when the Italian prime minister attended), his share in the work was somewhat subordinate, though he appended his signature to the Treaty of Versailles, and to the treaty of guarantee to France against German aggression. When the Conference was over, he was glad to be relieved of the burden of a laborious office which he had relinquished the Secretary of State's seals to Lord Curzon, but remained himself in Mr. Lloyd George's Cabinet in the honourable but comparatively sinecure office of Lord President of the Council. He was appointed chief representative of the British Government at the first Assembly of the League of Nations in 1920; and also at the Disarmament Conference at Washington, D.C., in Nov. 1921.

Mr. Balfour's eminence, and his patriotic readiness to resume in war-time, in spite of advancing years, official labours in a secondary position, were suitably recognized on the King's birthday in 1916 by the grant of the Order of Merit, by which he received a distinction which he must have peculiarly valued, when he was elected chancellor of his old university, Cambridge, in succession to his brother-in-law, Lord Rayleigh. (G. E. B.)

BALFOUR OF BURLEIGH, ALEXANDER HUGH BRUCE, 1st (or 6th) Baron (1849—1921), British politician, was born at Kennet, Alloa, Jan. 13, 1839, the son of Robert Bruce of Kennet. He was educated at Loretto, Eton and Oriel College, Oxford, and in 1869 was restored by Act of Parliament to the barony of Balfour of Burleigh, to which title his descent from the 5th baron, who was attainted after the Jacobite rebellion of 1715. He first came into public notice as a member of the factory commission of 1874, and afterwards acted as chairman of many other commissions, including that on educational endowments (1882—9). From 1889 to 1892 he was parliamentary secretary to the Board of Trade in the Conservative Government, and from 1895 to 1903 (when he resigned as a Free Trader opposed to tariff reform) Secretary for Scotland. In 1903 he became chairman of the commission on food supply in time of war, and in 1909 of that on trade relations with Canada and the Western States, receiving in 1911 the G.C.M.G. as a reward for his services. From 1906 to 1917 he was chairman of the committee on commercial and industrial policy after the war. Lord Balfour, who received hon. degrees from all the Scottish universities, was from 1869 to 1899 lord rector of Edinburgh University and from 1900 chancellor of St. Andrews University. In 1904 he was appointed Lord Warden of the Stannaries. He published in 1911 The Rise and Development of Presbyterianism in Scotland. He died in London July 6, 1921.

BALKAN CAMPAIGNS (1914—8): see SALONICA CAMPAIGN and SERBIAN CAMPAIGNS.

BALFOUR OF SALONICA (see 3:258).—Geographically speaking, the Balkan Peninsula is a meeting-point of European and Asiatic relief (see fig. 1): the Dinaric ranges belong to the Alps, the Carpathians and the Balkans seem to be connected in an arc, and the main tectonic systems of the peninsula have a geological structure similar to the ranges of Asia Minor from which they have been separated since the Phocene or diluvial period. In the same way, areas of strongly contrasted climate are to be found in close proximity, e.g. Mediterranean on the Adriatic and Aegean coast; Steppé, like that in Asia, on the extensive plain formed by the Danube and the Maritsa; Central European in most of the peninsula; Alpine on the higher summits (see figs. 1 and 2). They are sometimes intermingled: valleys which reach far into the mountain masses enjoy a Mediterranean climate as, e.g. the lower Drin valley in Albania.

The distribution of soil affects the character of the vegetation as much as climate: north of the Balkans and of the Koponik plateau and the Ardennes, the soils are composed of clay or loam, and humus, where steppe meadows, forests and general cultivation prevail. On the central highlands are coniferous forests and Alpine meadows, while on the slopes of the northern mountains of forests of oak and birch trees, remnants of extensive primitive forest growth in the valleys as well as on the hills; while in S. and W. prevailing development of the population had not turned seaward, grown in the fertile plains of Thrace and Macedonia, olive and orange trees flourish in the most sheltered places along the coast.

The extension of mountain barriers, climatic influences and zones of transition between the Mediterranean zone and the Carpathian or the Tatra, determine a difference between the areas of the same geographical names, like Balfour, which are called in Yugoslavia, in Hungary, in the Balkan countries, or the name of the country, in Russia, etc.

Natural Regions.—The Aegean region is remarkable for the indentation of its coast. On the Hellenic part (Peloponnese and Crete, Rhodos, etc.), and the west coast of Asia Minor, which points S.E. towards Asia Minor and turns its back to Europe, Karstic characteristics are well developed in the limestone areas of the Ionic coast. The climate is typically Mediterranean; summers are long and hot, and the atmosphere is clear and temperate; the rivers are not perennial. Among the nádus growth, cultivation is restricted to small fields like oases. On the slopes and in the bottoms are orange trees, and in the arid or high ground the annuals and grain crops, sometimes with sea-grass, Assuming, as<br>...
low passes render communication easier. The lower Danubian plateau is the only part of this region in which relief, climate and production are almost uniform; the unbroken monotonous surface is dissected regularly by deep-cut asymmetric valleys facing fault scarps, running from S. by W. to N. by E. Like southern Russia and Rumania, it is covered with neogene sediments and loess of wonderful fertility, but trees and grass are very scarce out of the valleys, the water table being too deep down. During excessively dry summers the small streams cease to flow, and in cold winters, even the Danube is frozen. Summer droughts make the crops of wheat uncertain. The characteristics of extreme continental climate and vegetation increase eastward in Dobrudja and favoured the settlement of the steppe Slavs and Ugro-Finnish Bulgars, while the uniformity of relief and the proximity of Constantinople made control of the country by the Turks easy.

The central and western Balkans stand out in contrast; high hill masses of palaeozoic schists, granite and mesozoic rocks, often chalk, are bounded on the south by abrupt fault scarps of a few hundred metres overlooking the plains, and, on the north, gradually fall in folded ranges. The eastern Balkans, consisting of sandstone, schists, flysch, are lower. Unlike the mountains of the central parts of the peninsula, the folded Balkans contain few faulted basins (Orhanyve). Except for the Yantra and Isker running south-north through the massifs and the Kamtschya and Provadiya running west-east through epigeenic ravines, they have an undiversified drainage and are like the basins cultivated with oats, barley and potatoes, while cattle are raised on the grassy and forested hills. Between the schists and granites of the Rhodopes and the mesozoic rocks of the Balkans lies the tectonic basin of the Maritsa, showing strata of sandstone and paleogene limestone below alluvial deposits. The climate varies:

it is Mediterranean as far north as Philippopolis, favouring the cultivation of maize, tobacco, the pepper plant, the vine and mulberry trees along the Maritsa; in the east around Jambol and Staro Zagora a steppe climate prevails, favouring wheat. The small tectonic basins of the sub-Balkan depression are liable to lesser extremes of climate and are well known for their rose gardens as at Kazanlik and fruit orchards as at Zlatitsa. The whole region facing Constantinople felt Byzantine or Attilian influences strongly and was the first domain of the Bogomils during the Middle Ages.

West of Sofia, the upper Isker basin is a natural Viskar unit. In the centre, the Viskar and Luyja mountains are an area of eruptive rocks and mesozoic strata folded east-west and surrounded by low limestone ridges, gentle on the north (Srbnitsa) and ragged on the south (Vlaska). Isolated tectonic basins and karstic depressions, such as Kusustendil and Grabovo, are the only cultivable areas. The country, poor and deforested, is a barrier to communication—the Shap tribe lives there under primitive conditions with Bulgars settled at the approaches. Sofia overlooks the Isker, Struma and Nishava, leading respectively to the Danube, to the Aegean and to the Morava-Vardar. To the south, the Rhodope system, a high mass showing glacial valleys and cirques, and almost perennial snows, is covered with forests or meadows partly inhabited by Pomaks, Vurdu and by transhumant Kutzo-Vlachs (see fig. 3).

Unlike the Balkan the Morava-Vardar region is not open to eastern influences. Its main communications are longitudinal, along a depression leading from Central Europe to the Aegean Sea. Various formations are displayed in the relief—the pretertiary Rhodope mass, the tertiary Dinaric and Carpathian ranges, the eruptive rocks of the Ibar and Bregalnitsa with their rich iron and copper fields, most of them by their great height impeding the west-east...
communications. The massifs enclose tectonic basins still or formerly occupied by lakes, and connected with the Morava and Vardar valleys or with the Ovště Polve and the Strunja. North of Nish, the Shumadya is the southern part of the neogene Panonic lake. It slopes gradually by seven terraces from 960 metres to 120 metres towards the Danube and the Sava. On a lacustrine soil, the monotonous of the crops is broken only by forested hills—former islands in the Panonic lake and remnants of an old extensive forest. Similar morphological features are found E. of the Carpathic Rtny (1,566 metres) in the Timok basin, previously occupied by a Pliocene lake. The climate is modified by central European type with abundant rain and a long mild autumn, and a soil of loess and humus make Shumadya the best maize district in the peninsula.

Pigs are raised in the decreasing forest area. White villages, crowded by a purely rural population repute for good sense, humour, democratic spirit and strong national traditions, are scattered among green plain orchards. In close touch with Central European civilization, Shumadya early cast off the yoke of distant Constantinople and became the Piedmont of the Serbian renaissance. South of Nish the country is more isolated; Rashka is composed of tectonic basins (Nish, Kosovo, and Skopje) encompassed by abrupt slopes of compact masses of schist and limestone. The higher summits show ancient glacial features. Towards the south, the relief is more and more complex. In Macedonia, crystalline schists and granites of the Rhodope system prevail on the east, sandstones, serpentine, and limestones of the Pindus on the west. Among the latter are higher summits (Perister, Kajmakcalan, 2,255 metres) and tectonic basins (Plevna, 900 metres). The climate is moderate, except in the south-east where several Aegean gulfs penetrate the interior along the Struma and Vardar, but winters last longer and are colder than in Shumadya. The lake-floor basins are occupied by oases, and the hills and flats, but forests and summer pastures of the hills are a region of transhumance, especially in the west, equidistant from the Adriatic and the Aegean. Fields of poppies and rice and vineyards occupy large spaces in south-eastern Macedonia. The inhabitants live mostly in the basins but also on the terraces. In Rashka and Macedonia towns are more of the Turkish type—with their aggregations of wooden shops on narrow, dirty streets in closed and central covered bazaar. In Shumadya, more open to European influence, the town streets converge towards a central piazza or market, and the villages extend along valleys and roads, contrasting with those of the Chifllik type of the Vardar country. The former is an aggregation of small units scattered in particularism and submission to Turks which are still noticeable amongst the people, though disappearing through the influence of returned emigrants.

The Drin-Dinaric region differs from that of the Morava-Vardar in its lack of penetration and union and by a well-defined morphology. From the Lybylyana basin to the Gulf of Arta, it is delimited on the E. by depressions, among which are the upper valleys of the Vardar, Nera, and Drin. The beds are folded and dissected N.W.-S.E., so that from W. to E., the littoral area (primarily) is succeeded by a barren karstic plateau (shumadya) and then by high mountain ranges (プレナ) parallel to the coast, which is a coast of submergence of which the higher parts form islands. The strike of the folds restricts transverse relations, except S. of Scutari where, in the Pindus ranges, it becomes west-east. Crests of the underlying carbonate rocks often appear through the folded and dissected surface, but the rugged domolitic peaks are higher. Depressions and gentle slopes prevail in the Bosnian schists of the east, steps of cretaceous limestones sloping from 2,000 metres to 800 metres in the plateau of the west. These steps have been transformed into barren karst, with subterranean rivers, high temperatures and abundant rainfalls as a new line of ranges along the coast. Intensive mineral deposits, especially iron and copper, are found in the palaeozoic and tertiary rocks.

The karst morphology is less important where the schists, sandstones, and serpentines predominate in the Pindus regions. Instead of being indented and island-dotted, as in Dalmatia, the Albanian coast is straight and deltaic. The Mediterranean type of cultivation prevails, and the process of penetration is long and slow. The alluvial Pindus valleys are cultivable areas and the Albanian slopes are covered with pasture and olives up to Elbasan on the east. The population is scattered except on the edge of the polye, where it concentrates in order to avoid building on the limited "terra rossa" area. The Alpine type of house prevails on the planinas from Carniola to the districts occupied by the Vasovski-Schib tribe in the upper Lim valley, the Chifllik in southern Albania, the Mediterranean on the Primary and some parts of Zagora. The towns in Albania are similar to those in inland Mediterranean type (Dorazio Valtos). On the other hand, Spalato, Zara and Ragusa, old harbours along small bays and narrow headlands, are an element of maritime life which helped Slav and Latin influences to combine in the early cities, producing a high civilization. On the planinas is a pasturage favoured a sturdy independence. The same characteristics are noticeable in the Pindus region which, isolated from the sea by marshes and lagoons, is still the most extensive domain of tribal life. The Unity of life, as well as the morphologic features, is a determinant factor of the natural region.

Area and Population.—The political divisions do not exactly correspond with natural units described above.

Civilizations and Melanesian Movements (see fig. 3).—Various civilizations—Byzantine, Turkish, Occidental and Patriarchial—were adapted in their distributions to geographical conditions, each of them leaving a deeper impress in a definite area. Byzantine influence impressed material life and moral ideals throughout the Middle Ages, and it was carried by the Greeks and Aromani along the longitudinal depressions under Turkish rule up to the Danube and the Sava, but could not be maintained in the areas successively cleared by the Turks. It does not now appear farther north than the Balkans and the Shar Plalina. It is still noticeable in the city life, relying on strict trade unions, in dogmatic quarrels, and in the struggle to make money at all costs. Turkish and Oriental influences first came across the straits and the island-dotted Aegean. The Greeks and the Venetians from Asia Minor, the last of these especially into Bulgaria. The Islamized Serbs extended the area of Turkish habits and mentality far north and west into Bosnia. Turkish and Oriental influences are still manifested in special care for weapons and harness, in lazy habits, and in a strange mixture of goodness with brutal passions. Under submission for so long, the Christians still maintain the Beta mind and conceal their feelings. In Turkish territory and Thessaly the economic system of tenure called
Chilidik persists. The begs and agas, and Greek landowners of Thessaly, the former being descendants of the landowners who adopted the creed of the conquering race, own the ground cultivated by the kmets or chiflikye and impose heavy taxes upon them.

The western European countries and the Balkan world came early into contact. The Romans crossed the Adriatic and Latinized the old Illyrian tribes up to a line from Alessio on the Adriatic to Ratiaria on the Danube, south-east of which the Greek language prevailed. Later, the House of Anjou in Albania, the Franks in Constantinople, and the maritime and commercial empires of Genoa and Venice hardly carried Occidental influences to the east. But the Mediterranean type is conspicuous in Dalmatia and in Constantinople, and the Latin is less noticeable on the planinas. Occidental architecture may be noticed in a Serbian church of the 13th and 15th century at Detchat. From that time, in consequence of these commercial and intellectual relations, a few words of Latin origin were introduced into the Serbo-Croatian language. After the 18th century it was a principle of Austrian policy to carry Central European influences far southwards; the Austrians brought their habits of city life, their methods of trade, their engineering, and their house furniture, but did not make their mark on intellectual development. North of the Shar Planina and of the Balkans, except on the coast and in the Serbian plains, the patriarchal type of civilization prevails. It is also noticeable in Albania. Its main characteristics are the organization of the tribes in Montenegro, northern Albania and Raska, and that of the Zadruja from the Adriatic to the river Ibar. In the latter three or four families live together, obeying the oldest member of the group, and cultivating ground which is owned in common. The Zadruja is chargeable for the taxes, controls the expenditure, is responsible by law for, and makes profit on the work of, each member. Some groups consist of as many as 70 members. The ground, except forests or pastures (stojer), becomes more and more divided up. The nucleus of the tribes is made up of old families related together and enlarged by the admission of foreign groups, or by conquest of new territories. The Montenegrin tribes hardly made a livelihood on the barren karst and had to keep small in number; while the Rascian tribes, in an area full of resources, became more and more important. On account of geographical isolation and the prevention of exogamy amongst the old tribes, tribal life developed into particularism, but the wars against the Turks united those tribes which, when not fighting, were occupied only in pastoral pursuits or the leading of convoys.

The distribution of civilization has been greatly influenced by metanastasic movements. The invasion of the Turks in the 14th century determined local migrations, especially among the Serbs. The Dinaric Serbs from Montenegro and Herzegovina moved eastward and settled in the forest glades of Shumadja, or northwards along the Dinaric ranges as far as Istria and Carniola. People from Kosovo and Makarska do not coincide with the Turks settled in the plains and valleys of eastern Shumadja. The Macedonians moved along the Vardar and Morava valleys and, with the Serbs of the old districts, crossed the Sava and Danube and settled in Styria, southern Carniola and Croatia. Among the Bulgarians, the Balkanye alone left their mountains for the lower Danubian or the fertile Thracian plains. The Albanians often changed place. Pushed back from the Black Drin by the Slavs in the 6th and 7th centuries, most of them adopted the creed of the Turks in the Middle Ages, and travelled freely through the whole peninsula; in the 18th century, half-Albanian Malissores settled at Novibazar; a few Mirlitons pushed up to Kosovo; the central Albanians to near Skopje and Tetovo; the southern Albanians to the Peloponnese. Along the main roads are Greek commercial colonies and Turkish military posts. The gradual clearing of the peninsula caused metanastasic movements of the Turks back towards Constantinople and Asia, and of the Christians back to the homes of their ancestors. The Turkish domination was responsible for many migrations: after revolts, and every fourth year as one-fifth of the young Christians entered the armed service; service as Vezheteri, entire families took refuge in the high masses. During the transition between the Turks and the Austrians in the 18th century, the Serbian insurgents, to avoid reprisals, had to follow the retreating Austrians. During the liberation wars led by the Kara Georgievitch in 1804 and by Milosh Obrenovitch in 1815 many Serbians migrated from Novibazar and Nish into Shumadja. Economic conditions also played their part in those movements: entire families left overcrowded cultivated areas for rich but less inhabited areas. Scarcity of food pushed 10,000 Montenegrins eastward into Serbia in 1860. Many kmets, trying to escape bad conditions of the tropical boundary line Vakufast, entire families took refuge in the high masses. Scarcity of food pushed 10,000 Montenegrins eastward into Serbia in 1860. Many kmets, trying to escape bad conditions of the tropical boundary line Vakufast, entire families took refuge in the high masses. During the transition between the Turks and the Austrians in the 18th century, the Serbian insurgent
often occupy the valleys and littoral plains. They have lost ground in the north-east since 1878 and the withdrawal of the Sultan's authority.

The Aramuni, numbering approximately 160,000, are found in 154 detached settlements of the southern peninsula. They are nomad shepherds migrating between the mountains and the littoral plains. Remnants of the primitive Latinized population, they have continued to decrease since the 18th century, when it is estimated they numbered 500,000. Some of them have settled in the mountains after having made money as shopkeepers in large towns.

The Yugoslavs, numbering about 15,000,000 south of the Danube and Sava, are the most numerous people in the peninsula. They are divided into Serbo-Croat-Slovenes (10,000,000) and Bulgars (4,700,000), all agriculturists. The majority of the Serbs, Croats and Slovenes came from trans-Carpathian countries in the 7th century. The distinction between them does not arise from any linguistic, racial or even religious difference. The national spirit of the Serbs gained force after the battle of Kosovo in 1389. At the end of the 15th century, the Orthodox religion, diffused through the Serbs after metanastatic movements, became national, and it helps to maintain unity. The Serbo-Croat-Slovene Kingdom, generally called Yugoslavia, does not include all the Serbians, Croats and Slovenes of the Balkan Peninsula—more than 400,000 were annexed to Italy by the Treaty of Rapallo. The Macedonian Slavs extend southward to Hellenic territory, almost to the river Bistritsa.

The Bulgars, who descend from a fusion of the Slavonic element with a later Ugro-Finnish immigration, inhabit the kingdom of Bulgaria, parts of Dobruja and Thrace. On account of the proximity of Constantinople and of the general geographical conditions, they were more submissive to the Turks than any other part of the population, so that the word "Bulgar" often meant a social state different from that of the Turkish conquerors. Its political meaning dates from the creation of the Exarchat in 1870 and the wars of liberation.

The remainder of the population is composed of Armenians, who live in trade centres like Constantinople; of Jews, immigrants from Spain who form half of the inhabitants at Salonika; and of gipsies, wandering, or in scattered settlements near large towns.
BALKAN WARS

373

Religions.—The Turkish conquest was followed by numerous conversions to Islam, so that the Mahomedan population (3,000,000) exceeds the Turkish element. More than half of the Albanians and 32% of the inhabitants of Bosnia and Herzegovina have adopted the creed of the conquering race. The great bulk of the Christian population belongs to the Orthodox Church, of which the two most important ecclesiastical divisions are the

Serbian Bulgarians, and Greek Churches are in reality autochthonous. Most of the Serbians, Croats and Slovenes of Slovenia, Croatia and Dalmatia, some of the Gegg tribes in Albania, and 22% of the population in Bosnia and Herzegovina belong to the Roman Catholic Church. Some Bulgars belong to the Uniate Church, which keeps Orthodox rite and discipline under Roman authority. The Gregorian and Uniate Armenian Churches each have a patriarch.

Languages.—The Slavonic and Greek Nationalists succeeded in preserving their language. Early in the 17th century, the Serbo-Croat in Raganus had a common literature, written in the

Albanian, a remnant of the ancient Thraco-Ilyrian speech, belongs to the Indo-European family, but lacks literary distinction.

BALKAN WARS (1912–3).—This article gives an account of the wars of Bulgaria, Serbia, Greece and Montenegro as allies against Turkey in 1912 and 1913, and the short war which followed between the former allies, with Turkey and Rumania intervening, in the summer of 1913.

1. The Balkan League.—The formation of a military alliance between Bulgaria, Serbia, Greece, Montenegro, and, to a lesser degree, Rumania was the final step in an evolution which began in 1909, and in its last stages was hastened by the Italo-Turkish War of 1911. The immediate cause of war was the state of Macedonia under Turkish rule. On June 19 1912 a military agreement was made between the general staffs of Serbia and Bulgaria, in accordance with the previous political treaty of alliance signed on Feb. 29 1912. Greece followed suit with a political treaty in May and a military agreement on Sept. 22. Montenegro did the same in the course of the summer, and, while Turkey was still negotiating her peace with Italy at Ouchy, the four allies mobilised their armies (Sept. 30 and Oct. 1 N.S.). Turkey, since the Balkan War Revolution temporarily dislodged, was in no condition to meet their onslaught. Although the prestige of the individual Turkish soldier as a fighting man stood high, and the beginnings of many reforms in the education of staff and regimental officers were made, the military situation of the army as a whole proved to be far below the reputation which it enjoyed amongst the military experts of Europe. Turkey’s opponents, on the contrary, had in recent years not only reformed themselves and secured their financial and political position, but also made those minute and careful preparations of detail which when the time comes translate themselves into smooth concentration, and, accordingly, into success.

Strategically no less than politically, Turkey was on the defensive. Her European possessions formed two separate theatres of war, Macedonia and Thrace, which were linked only by the coastal railway, Dekretović, Gorna-Šumadija, and this line, open and supplied, constituted the only road or rail communication between the section to Bulgarian raids from the mountains on the N. and to Greek raids from the sea, and of no high technical efficiency in any case. The dispersion of a large part of her army and notably of her reserves in Asia Minor, where rail communications were few, and roads barely developed, to put down the various revolts of the Turkoman, and the Manchou or Mongols in the far eastern part of her empire, and her garrisoned at all times by a large army with Tship (Ships) as its area of war concentration, and to constitute in Thrace a covering army which should be reinforced by the troops from Asia as they successively arrived, up to the limit of the road along which offensive operations against Bulgaria. To assist the defence in the first, or waiting, period Adrianople was organized as a modern fortress, and Kirk Kilisse and Struma ( İstanbul province) were fast being re-enforced with the troops of the frontier forts.

The line of communication with Asia was secured against the Greek fleet by the Dardanelles fortifications, which enabled Rodosto to be used as an advanced base.

The short time between the mobilisation of the Turkish forces in Europe (other than garrison troops) was as follows: In Thrace were the I. Ordu (Constantinople), with the II. Corps (Constantinople), H. Corps (Rumeli), H. Corps (Kirklis), and IV. Corps (Adriano-ple). These constituted 12 active divisions, plus, on mobilisation, 11 first reserve divisions and 6 second reserve divisions. In Macedonia were the II. Ordu (Salonica), with the V. Corps (Salonica), VI. Corps (Monastir), VII. Corps (Uskub), and the independent 22nd Div. (Kozani), 23rd Div. (Yannina), and 24th Div. (Scutari).

These constituted 12 active divisions, plus, on mobilization, to first reserve divisions and 3 second reserve divisions. Furthermore, the reserve formations of Smyrna, and both the active (VIII. Corps) and reserve formations of Dalmatia, belonged to this division. Under various circumstances, and especially if Greece were neutral, these forces, totaling 56 divisions, or 37 active divisions, would be available. In the alternative, they would be available, with some delay in point of time. To reinforce the army in Thrace to 48 divisions it was necessary that the geographical and Bagdad respectively, could be grouped as an army of the Caucasia in case of a Russian war, but were practically unavailable for Europe. So also were the forces in Hejaz and Yemen, and Tripoli.

Neglecting second reserve formations, therefore, the paper dispositions gave Thrace 23 and Macedonia 22 divisions, to either of which might be added a farther 18. But, as usual in Turkish military history, this imposing paper total of 63 divisions represented far more the ideal of the real allocation than the actual. This was due to the transport capabilities, and the necessity of garrisoning almost all parts of Albania and Macedonia to prevent local risings. added to the fact that each garrison was in administration and training, and the customary dishonour in supply and equipment matters, consisting in the putting into the field of two armies which were numerically inferior, unequally trained, and poorly equipped—possessing indeed few, if anything, beyond the solid fighting-worth of the individual Mahomedan Turk.

With all this, however, the prestige of a great Power facing a group of small states, whose mutual hatred and rivalries had onlly just been magnified, stood his especially in Germany. The effects of the Turkish army reforms initiated by von der Goltz and others were overrated. In the Turkish army itself, consideration was given to the strength of the two Turkish armies, owing to inexact and defective returns, cannot be stated. But it appears to be true that the Thracian army had no more than half of its nominal strength of 226,000 men, while the Macedonian army short of the VIII. Corps and the Damascus and Smyrna reserves and scattered as it was, can hardly be credited with more than 200,000 of its nominal 340,000, of whom no more than 50,000 combatants were in fact ever assembled on one battlefield.

On the side of the allies, administration being regular and sentiment uniform within each army, the paper strength and order of battle represented, and can be surmised at thus.

Bulgarian Army—Nine divisions (1 Sofia, 2 Philippopolis, 3 Steven, 4 Shumla, 5 Kuschuk, 6 Vratsa, 7 Dnipr, 8 Stara Zagora, 9 Pleven) each of two brigades plus a reserve brigade formed on it. The regimental strength of a division was 24 battalions, i.e. of a normal European army corps, and 2½ times that of a Turkish division). 4 A roth Div. and an 11th Div. were formed on mobilization out of the reserve regiments, and took the place of the reserve battalions (these had two brigades each instead of three). There was also a cavalry division. Division strength of the field army about 280,000.

Serbian Army—Five divisions of the I. Ban and five of the II. Ban, each designated by the regional name (Dunave, Morava, Drina, Shumaja, Timok and the Ban numeral, e.g. Timok I, Timok II, Ban 2, Ban 3, etc.). The number of infantry regiments (1st tier divisions) was 43; the number of artillery (demi-brigades) was 25. The army was therefore a two-thirds that of a Bulgarian division and

1 Even solidarity within the unit had been seriously shaken by the incorporation, under new conscription laws, of Christians allied in race and religion to the enemy peoples.

2 The 6th Div. had only two brigades.
not quite twice that of a Turkish. The infantry strength of II. Ban divisions varied, but was usually three 4-battalion regiments. A numerous reserve reserve force, and a battalional reserve, being effective to
the 87,000, almost exactly 10% of the population. In the whole war some
450,000 men are supposed to have been mobilized.

Greek Army:—Four active divisions of 9-11 battalions each
equipped, trained, and manned. The central position of privity which Bulgaria assumed in the league, by the more
regular character of her army and her civil administration, and by
the nearness of Constantinople to her eastern frontier, argued a priori
that Thrace was not only the "principal" theatre, but the single
important theatre in which practically all military effort should have
been concentrated by both sides—a judgment which ignored the
relation of strategy to war policy, and one for which in the sequel
Bulgaria was destined to pay heavily. For the objective of the
war was Macedonia, as von der Goltz had foreseen in 1909 when he
increased both the present and the potential strength of the Turkish
forces, and was intended to achieve. The Greek army would not be
conquered once and for all, for the possibility of a Turkish
counter-offensive to recover the lost province was excluded by the
Greek navy as effectively as the possibility of reinforcing Tripoli had
been by the colonial and remote and thin Italian navy. The direction
for the allied was the obscurity of the ethnographic lines in central
Macedonia. Here the population was neither definitely Bulgarian nor
definitely Serbian, and unless the two and the Turks, and
the Moslems, and the faintly Christianized Albanian absents
member would certainly suffer when it came to drawing the
frontier-line.

On the other hand, each of the allies had special objects which
might, and in some cases did, conflict with the common object.
Bulgaria cherished ambitions in Thrace which extended even to
Constantinople, and she had to consider the fact that sooner or
later the Turks might disengage from Thrace and reinforce the
their own allotted reserves but also by those, above alluded to,
which the Greek navy prevented from going to Macedonia. Further,
Bulgaria coveted not only a coast-line on the Aegean but the great
provisions of the Danubian Rhodopes.

Serbia, on her side, had to consider not only central Macedonia
but northern Macedonia and the Sanjak of Novibazar. These
provinces would infallibly revolt against the Austrian authority as
soon as the Turkish forces withdrew to concentrate for battle in the
S., and unless bona fide troops of the Serbian Government came
to occupy the country, a state of disorder would arise that would
exclusively bar the Austrian armies from entering the country.
Bulgarian interests were determined to card for herself a way to the
Ardathic through Northern Albania. Greece for her part had a minor objective in
Epirus—a region of which the northern limit was vague—and as a
result of two-thirds the Asiatic and the Indo-European cultural
borders, not to mention more remote objects in Asia Minor.

Montenegro's aims were limited to local expansion southward
into the land between the Sanjak of Novibazar and northern
Macedonia; in both of these directions some conflict of interest
with the Serbian Government might arise.

All the things were, in their varying degrees, elements of policy
upon which the Allied strategy must have its war aims were to
be obtained, and accordingly the military league between Bulga-
ria and Serbia provided for a Serbo-Bulgarian army of 7 Serbian
and 3 Bulgarian divisions to invade Macedonia, moving con-
centrating against the front Uskuk-Kumanovo-Kocanovo, forming
the outer contour of the plain known as Ocche Pole which
was assumed on both sides to be the natural concentration area of
the armies.

If the road system was judged by the staffs sufficient to permit of
the augmentation of the left wing, this was to be made up of 2
Serbian and 3 Bulgarian divisions—a force equivalent to 10 Turkish
divisions.1 The same would be the case with the 5th Serbian division (of
which the strategic concentration were nearly complete; and several frontier skirmishes had already taken place.

The war started on Sept. 30—Oct. 1. Montenegro was the first to declare war, on Oct. 8. Ignoring the
fact that the Serbs were the aggressors, they declared war on
Oct. 12, 1912, on the 29th of Oct. 1912, on the 29th OCT.

The 7th Bulgarian Div. was nominally under the orders of this
army, but in fact obeyed orders only from the Bulgarian head-
quarters.

The 6 or 7 Bulgarian divisions remaining were to form the army
deployed on the Adriatic coast.

The role of Greece, when she acceded to the league, was by
offensive operations from Thessaly to bind as many hostile troops as
possible, incidentally occupying the country which it was intended to
acquire. The Greeks were to close the road to Turkish
transports. A minor Greek force in the Epirus theatre, and the
Montenegrins in northern Albania, were similarly to absorb the
Turkish garrisons (3 independent divisions) and to conquer territory.

On the very eve of operations, however, a drastic change was made
(Sept. 28) at the instance of Bulgaria. Instead of 3 divisions, only
the two was to operate in Macedonia, and this was directed to move
independently from Dupnitsa in the direction of Seres and Salonika.
The striking wing of the allied army—that which, directed upon
Ship, would have come in upon the rear of the Turkish positions on
the Ocche Pole—was thereby deprived of a force of about 80,000
men. And Bulgaria, by evading at the last moment an obligation
that was not merely a part of a military scheme but was included in
the political league, took advantage of the amiable atmosphere of friction which was not likely to help her in her claims to the
doubtful districts of Macedonia. Serbia, submitting rather than
agreeing, redistributed her forces, and the strategic deployment
and concentration was thereby seriously interfered with but was out as follows:

Commander-in-chief, King Peter
Chief of the general staff, Gen. Putnik

II. Army
Gen. Stepanovitch
(12,000 men)
1. Army
Crown Prince
(10,000 men)
II. Army
Gen. Yankovitch
(10,000 men)
Iar Force
Gen. Zhivkovich
(18,000 men)
Vayor Brigade
Gen. S. Pashinitch
(9,000 men)

The 1. Army was cantoned in the Morava valley, about Vrania,
with outposts on the frontier. The II. Army on its left (now reduced
to one division) was concentrated along with the 7th Bulgarian Div.
about Kusunday, and the III. Army on its right, behind the
frontier, on the various mountain routes E. and N. of Pristhina.

The general plan was to advance to Kumanovo and Kusunday,
and to place the left wing at Kumanovo, in the passage to
Novibazar. The Yavor Brigade was temporarily held back
2
Serbo-Bosnian frontier. The intention was that

Kusunday, while the II. Army should advance through Kumanovo
to the captured territory, and with the remainder advance rapidly S.
through the Kocanovo-de Sjenik, and the unattached unit of the
army, was to be advanced to support the
Kosovo.

The Yavor Brigade, and eventually the Yavor Brigade also, were to
clear the Sanjak of Novibazar of Turkish garrisons and Albanian
bands. The Montenegrins were to cooperate to some extent in this
work, but their part was effective in the direction of the

Mobilization began in all the countries affected on Sept. 30—Oct. 1.
Montenegro was the first to declare war, on Oct. 8. Ignoring the
circumstances which would agree to any changes in the
status quo in S.E. Europe, the other
theatre of the league presented a joint ultimatum on Oct. 13.
Turkey rejected this on the 15th, and on the 17th war was declared.

On Oct. 20, 20, while the Serbian I. and II. Armies closed up on their advanced columns, and engaged some of the
Serbian forces (about 3 divisions) which had been evacuated

On Oct. 21, the I. Army advanced in three columns: Moravia I.,
II. Army, on the right, with flank guards in the Kusunday, fol-

1 The navy consisted of the "Georgios Averof," a powerful armoured cruiser, 3 old coastal battleships practically modernized, and
16 modern destroyers and other torpedo craft, including a submarine; as against the Turkish strength of 3 small battleships
(4 modernized coast battleships, 2 light cruisers and 20
effective destroyers and torpedo boats.

2 The relations of Serbia and Montenegro were not such that the
Serbian Government could easily hand over to Montenegro the entire responsibility for the conquest of the north.
lowed the Moravitsa valley; Danube I. and Danube II., on the left, of the Pećinja; while Drina I. moved along the worn-out lines between these rivers. The cavalry division was kept back till the infancy should have gained ground in the plain. The II. Army moved on the same day, but very slowly, along the Kyustendil–Egirdir-Aprika line, with instructions to advance thence both on Stratsin (Strain) and on Kratovo, gaining touch with the I. Army W. of the former place. Bulgarian co-operation was limited to a movement by one brigade over the mountains towards the upper Brahov, while the 7th Div. (frank) of Army E. of the Danian march over Jumaya Pass into the Struma valley, heading for Sere.

That evening, without having obtained touch either with the II. Army, or the III. Armies, the I. Army halted the line Talanovche-Star–Nagoricino, disposed in depth and entrenched, with orders to stand fast on the 22nd and wait developments on its flanks. Resistance so far had been slight, but on the 22nd Turkish forces of some strength were reported at Kumanovo.

The Ovche Polye was, after all, not to play the part of Königgrätz. At first, it seems, the Goltz plan of a defensive concentration there, to be followed by rapid attacks on division enemies, was adhered to by the Turks. But when at the last moment it became clear that the Bulgarian effort was concentrated on Thrace, ‘Ali Riza Pasha, commander-in-chief in the Macedonian theatre, was ordered to take the offensive. Zekki Pasha, in charge of three corps groups in the Vardar region, was at once directed by ‘Ali Riza to move forward against the Serbians as they debouched from the mountains.

Of ‘Ali Riza’s 25 divisions, 3 were scattered between Pristina and the Austrian frontier, 3 at Scutari, 3 at Dibra, and 3 at Prizen; 2 opposing the Greek main army in Thessaly and 2 the Greek secondary army in Epirus; 1 in the Struma valley and guarding the railway between Veles and Salonika, making, in all, with which were totally unavailable for battle in the decisive theatre. Of the remaining 9, 1 was at Pristina, 2 in the valleys of the Bregalnitsa and the Ovche Polyi; facing toward Bitola and Crni Kamen, and 6, forming the main group under Zekki, advanced across the Ovche Polye on the 21st and 22nd, the V. Corps then halting N. of Nosovenški, the VI. N. of Slatina and the VII. N. and N.E. of Kumanovo.

Viewed as a whole, ‘Ali Riza’s forces, scattered as they inevitably were through the need of holding territory, were reasonably well distributed, in that, though the Turks were in the ensemble inferior in the ratio of 1 to 2, their headquarter on the decisive battlefield reduced itself to the ratio of 1 to about 1.2. Had still further economies been practised (in the Struma valley for instance) this handicap might have disappeared. But uncertainty as to Bulgarian movements and dispositions was not yet cleared up. In any case, the seizure of the initiative at a moment when the Serbian I. Army was still cramped and out of touch with its neighbours went far to neutralize the numerical disadvantage.

A matter of fact, Zekki in tended to use the day of the 23rd for closing up his columns and narrowing his front; and, Prince Alexander’s intentions being the same, the day would have been uneventful but for the initiatives of subordinates on both sides.

The Serbian Danube I. Div. on the evening of the 22nd, had been tempted to go forward, out of alignment, by the obvious tactical advantages of a position farther south. On the morning of the 23rd it was formed in an arc facing S. and S.W., with its left flank on the Pećinja, near Vosnik, its centre looking towards Slatina and its right on Bil Bazo; and in that position it was attacked by the heads of 4 Turkish divisions. A fierce battle raged all day on this front, while the other 2 Turkish divisions (VII. Corps) engaged Morava I., N. of Kumanovo with indecisive results, and the remaining Serbian

1

These outlying divisions are catalogued here as such. But their strengths were in reality very unequal.
The Turkish force opposing each of these amounted to about 2 divisions, but they retained their front, and the position was one which led to the conclusion that the Turks supposed the Greeks to be on the same scale of efficiency as in 1897. If so, they were deceived. From Trikala the Greek 4th Div. moved on Diskata and the upper valley. From Thessalonik the 2nd Div. advanced and re-occupied the salient W. of Tyrnavos and occupied Damasiu, and moved N. to clear the way for the 1st and 4th Divs., which from Tyrnavos moved directly on Elassa on the Melina Pass. The 6th and 7th Divs., with mountain troops, continued towards this point.

On the 19th Elassa was captured with little difficulty, the main Turkish position lying further N. in the defile of Saran-lopomon which traverses the Morava remaining firm to the right of the Xeria and the Vittras. On the 20th and 21st, the Greek divisions, which had converged on Elassa for the battle that had been expected there, were re-deployed, and on the 23rd the attack was delivered by all. The Xeria was divided, and the 4th Div. fell on the Vittras valley, marched on Serrovi, throwing out a flank guard to Grevena, while the 1st, 2nd and 3rd Divs. attacked the defile frontally and strengthened its rear by way of Vlaholivadia. The much smaller Turkish force was routed with a loss of 20 guns and many prisoners, and (what was more important) the Greek army gained self-confidence as well as local victory, at a cost of some 1,300 casualties. Part of the beaten force retreated from Kozian to Verria, and the Crown Prince occupied Koziani on the 25th.

In view of the urgency of occupying Salonika before the Bulgarians could cut off the Prince de Fontainebleau’s division route, the 5th Div. (5th Div. of Koziani and light troops of N. of Grevena) faced the Monastir direction, while the remainder, reinforced by the 6th Div., pushed on to Verria, and the 7th Div. worked along the coast towards Kaffendi. Both these were successes, the 5th and 7th Divs. making contact and gaining touch with the fleet on the 28th, occupied Eleutherochori and there created a new base, while from Verria the main army turned sharp N. and set towards Vittras in the same time-space as was occupied by Khairali. This ingenious manoeuvre placed the five divisions of the main body on interior lines with a base on the sea and a strategic flank-guard on either hand (Nov. 1). But the situation was grave for the Greeks, for Hassan Tubsin had drawn in forces from the Struma valley and was in position facing W. at Yeniye Vardar, while Djavid Pasha at Monastir had assembled an effective force from troops that had come in both from the Kumanovo and the Vardar routes. The 4th Div. was divided, and the 5th Div. was sent to Vittras, while the 6th Div. was able to attack on the 9th. The Serbian cavalry descending the Vardar had not yet passed the defile of Demip Kapo, the Serbian armies being prevented from the new movements above detailed, and even the 1st Army was scarcely beginning its movements against the Babaun Pass. As to the Bulgarian 7th Div., last thing desired by the Greek headquarters was an energetic advance of this force to force-stall them at Salonika.

On Nov. 2 and 3, while Constantine attacked the Yeniye Vardar position without success, Djavid fell upon the 5th and 6th Divs. and drove it with heavy losses to Khairali. Simultaneously, the Greeks from Gostivar who had already moved back on Kastoria, were driven back towards Vittras by the 5th Div. on the 4th, before these flank guards had been sufficiently beaten, the 7th Div. from Eleuterocohori had forced the passage of the Kara Amaik and were threatening to interpose between Hassan Tubsin and the Vardar. A report half on the heights, the V. Corps occupied the plain from opposite Novak to Kikurkeni, with its centre of gravity on the Prilep road. The VII Corps occupied the mountain sector; and the V. Corps was in reserve at Monastir.

A Serbian plan was to attack the Kikurkeni front and the heights abutting on the plain with Morava I. on the right and Drina I. on the left, on the battle- line of Vardar and Kichevo, and to do the same on the right of the defence with Danube I. and the cavalry division operating at S. of Novak. Timok II. was to be in reserve behind the centre. The necessity of maintaining at all costs the single supply route of the army—that through Prilep to point the Uskub-Salonika railway—nobody imposed a plan of battle that was to all intents and purposes frontal, for the projected movements of cavalry on Resma and over the Cerna could hardly be regarded as serious. From the 14th onwards, the Turks did not fight worthily.

The battle, projected for Nov. 14, was ordered to be postponed till the 17th. But on the 15th, as the divisions were getting into position, part of Morava II., carried away by its own ardour, launched a night attack on height X-700, and the Serbians were hard-drunk. The enemy was well prepared, position after position had to be stormed and it was not till the afternoon of the 16th that the detachment secured the height, at the cost of heavy losses. Meanwhile the rest of the army, according to orders, was merely making its final reconnaissances. On the 17th, the four battalions of Morava II. had to resist, still without help from the rest of the army, a series of heavy counter-attacks delivered by the Turkish cavalry and the energetic Djavid. The battle of Monastir, which was finally launched on the whole front on the 18th, will long be studied for its tactical incidents, but as an ensemble it is sufficiently described by saying that the resistance was 50% of the battle, and then a further pause was thought necessary to reassemble the units, scattered by mountain fighting, as well as to allow the two flank columns to come up. On the same day, however, hearing of the crisis on the Greek front, and arguing that it was both necessary to relieve pressure on the 4th Greek Div. and also possible to advance with undue risks against the Turks remaining in front of Monastir, the Serbian G.H.Q. ordered a tentative offensive towards Alince. This, carried out on the 6th by a part of Drina I., soon developed into an unintended battle, in which Morava I. and the cavalry division 5th were recalled on join. But the result of a day’s fighting, which was marked by initiative and combination of effort in the subordinate commanders, was to hurstle the Turkish V. Corps back to the environs of Monastir and back the second division to the defile at the end of the enemy was only prevented by stringent orders from G.H.Q. to halt and await the coming of the two flank columns. Of these, Morava II. had successfully driven back the Turks from Kichevo on Nov. 13, and was obliged to halt in order to organize its line of supply Gostivar-Tetovo-Uzkub, and the left column was only just beginning the passage of the Vardar at Krivolak. Still doubtful of the real situation on the Greek front, Prince Alexander, in agreement with Putnik, was determined not to fight the battle of Monastir till he should have all his forces in hand.

The assembly of the forces for battle on the line Mramortisan-Podine—Dubrovinovo was to be completed for Nov. 14.

The Turks also prepared for battle. Leaving only a few troops in front of Verria and of the Greek 5th Div. and Grevena force, Djavid Pasha brought back the rest of the VI. Corps to join Ali Riza at Monastir, where what remained of the V. and VII. were concentrated. The total combatant strength was about 49,000. The position taken up lay S. of the line of the Semitsa and thence along the marshy bank of the Cerna, its eastern half lying on the plain and its western half on the heights. The VII Corps occupied the plain from opposite Novak to Kikurkeni, with its centres of gravity on the Prilep road. The VII Corps occupied the mountain sector, and the V. Corps was in reserve at Monastir.

The Serbian plan was to attack the Kikurkeni front and the heights abutting on the plain with Morava I. on the right and Drina I. on the left, to attack and outflank the Turkish left wing on the heights by movements of Morava II. which was coming down from Kichevo, and to do the same on the right of the defence with Danube I. and the cavalry division operating at S. of Novak. Timok II. was to be in reserve behind the centre. The necessity of maintaining at all costs the single supply route of the army—that through Prilep to point the Uskub-Salonika railway—nobody imposed a plan of...
fighting effort of Zekki's reserves that the frontal attack of Morava I. and Drina I. succeeded with little difficulty.

Threatened by the Greeks—now again advancing on Florina—and by the Allied organization of the Bulgarian divisions, the Turkish forces were in a critical position. The Turkish garrison of the fort of Yamboli, and all that remained for the allies to do in the western theatre was to carry out the march to the sea, to occupy and police the region of Ojakoi—Keremetlia—Demotika. Afterwards, the 5th Div. of the Yamboli (the last refugees of Turkish authority), to ensure against Austrian intervention (for which purpose the main body of the I. Army was moved back to Uskub after a few days’ rest)—and to come to an agreement amongst themselves as to the division of the spoil.

On Dec. 3, Serbia and Montenegro joined in the armistice signed that day between Bulgaria and Turkey. Operations in Macedonia and northern Albania therefore came to an end. Greece, however, did not sign, and continued her operations, though these were in the nature of exploitation rather than of fresh effort, except in Epirus, where operations against Yamboli were in progress.

Owing to the necessity of garrisoning Epirus, the Turks had normally maintained two divisions in this theatre. These, and the nature of the country were quite sufficient to make the progress of the Greek forces very difficult. On Nov. 10, Gen. Sapundzakis then advanced to the outskirts of the fortress of Yamboli (Nov. 10), while a column of irregulars from Metsovo in Thessaly and another small detachment from Sandikouchi joined in on his flanks to assist in establishing a loose blockade. But this was the limit of his offensive possibilities, and the weather presently brought operations to a standstill for the time being.

During this, the operation of the field army which had completed its task in Macedonia was brought round by sea via Salonika. Active operations began afresh in the early spring. With adequate numbers and material resources, the Crown Prince was able to recover and reconstitute general order on Mount Olympus, and the Turkish garrison, numbering about 35,000, wounded and unwounded, surrendered next day.

Of the garrison captured in the Albanian theatre, though the Greeks on the S. and the Serbians in the N.E. attempted without success to round up the few Turkish forces, rallied by Djavid, which had escaped from the catastrophes of Monastir and Yambolina.

III. The Campaign in Greece—Through the change of plan which Bulgaria forced upon her ally on Sept. 28, Thrace became for the public, military and non-military alike, the principal theatre of war. Nevertheless, the actual plan of campaign of the Bulgarians still remained uncertain. It is known, however, that the successes caused it to be abandoned. On the Turkish side, equally little is known with certainty as to the original project, though it is probable that they expected to continue in defensive calculations. In the case of the I., II. and IV. Corps on the line of the Ergene and of the III. Corps at or in rear of Kirk Kilisse, with the fortress of Adrianople and the works of Kirk Kilisse acting as breakwaters in front. The situation was never altered in the last period of the war in favour of a general offensive, as in Macedonia. In these conditions, the facts must interpret themselves, at any rate in the initial stages.

Leaving the 7th Div. on the Macedonian side, the Bulgarians formed three armies between Philipopolis, Trnovo-Seimen, and Yambol, the latter with especial precautions of secrecy. The II. Army (Gen. Ivanov) on the right, concentrated the 8th and 9th Divs. about Trnovo-Seimen, and the 2nd between Tsepovo and Haskello. The I. Army in the centre (Gen. Kutilchew) concentrated between Nova Zagra and Kizil Aghach, consisted of the 1st, 3rd and newly formed 9th Divisions. The III. Army (Gen. Kavakli) advanced in the rear of the left flank, about Yambol, consisted of the 4th, 5th and 6th Divisions. In front of it was the cavalry division, with its main body in line with the main body of the I. Army. The 11th Div. was still in process of formation at Philipopolis.

On the day after war was declared, the ensemble, whatever the objects of its movement may have been, began to move—the I. and III. Armies southwards, and the II. south-westwards on Monastir Pasha (8th and 9th Divs.) and due S. on Kirjali (2nd Div.). Siege artillery was entrained at Sofia for Trnovo-Seimen on the 17th. On the 9th, the 8th Div. on the Maritsa, and the 9th on the left of the 7th Div. on the right of the 3rd Div. On that day, the 2nd Div. reached Kirjali on the Arda, while the I. Army crossed the frontier—3rd Div. on both sides of the Maritsa, 1st Div. on its left, and 4th in rear, all moving south. On the 21st and 22nd of December, the two armies opened up the corner entered Turkey at Ojakoi and Topchular, and the 2nd Div. turned E.S.E., heading for Demotika.

On the 22nd the first serious engagements took place in front of Adrianople. That fortress, with modernized permanent works, and a main defence line studded with infantry redoubts farther out and a line of fortifications guarding the main approach, had a very considerable perimeter. It was naturally divided by its four water-courses (Upper Maritsa, Arda, Lower Maritsa, Tunja) into four sectors. On the Lower Maritsa—Tunja sector the 3rd Div. of the I. Army was advancing on the fortress. The II. Army (Army of the King) and the III. Army on the Upper Maritsa—Arda front the 9th, also of the II. Army. The last named, advancing S.E. from Kadhikoi and Buldurgioi was violently counter-attacked. Each side extended southward in search of the other’s flank till the Arda was approached. But the combat was really decided by the intervention of the 8th Div. artillery on the other side of the Maritsa. Enfiladed, the Turks retired to their prepared line. Counter-attacks on the 3rd Div. moving down the Tunja had the same result. Thus the process of investing Adrianople began at the very outset, three out of eight divisions available in the theatre of war being employed in it.

The principal work of the main line was a group formed round Chiffit—Ekmechkioi which has been compared to a “Feste.” A group of the same character (Papas Tepe) occupied the ridge between Upper Maritsa and Arda, a fortified village barred the Ortakoi road in the Arda valley itself, and a third “Feste” had been constructed on Kartal Tepe. Similar groups of works at Pashachijir and Gunes Chiffik continue the line of defences, the 8th Div. being strongly opposed at and E. of Selolou on the 22nd, on which day also the leading troops of the 1st Div. came in contact with important Turkish forces in front of Selolou and Gechechian. At this time the 3rd Div. was fighting astride the Tunja at Bajiky-Sinaitsa—Munjalar—Tausan—Ortakij.

Instead of concentrating behind the Ergene, the Turks were in fact advancing northward to battle in accordance with the same general order that had sent Zekki to Kumanovo. The army in Thrace, commanded by Abdulla Pasha under the higher direction of Nazim Pasha, the Minister of War, consisted of the I., II., III. and IV. active corps and a number of reserve divisions which were only assembled slowly, forming a XV., XVI., XVII. and XVIII. Corps.

The original concentration points were for the I. Corps Yenije and Kavakli, for the II. Corps, II. and IV. Corps (in that order from right to left), and for the III. Corps, a small division (garrison) Adrianople, while the XVI. Corps was to hold the middle Ergene and the XVII. and XVIII. Corps to constitute themselves into a reserve corps in Thrace. Invasion plans were also adopted, and the last period of the war, beginning on Dec. 22, took place at Kirk Kilsie (XII.), Yenije and Kavakli (I.), Karali (II.), and Haava and Kuleji (IV.), with a cavalry division in front of the centre.

Adrianople, the XV. Corps was duly formed but the XVI., XVII., XVIII. were far in rear and in an embryonic condition, the XVI. indeed never formed as such.

From these positions the four corps advanced on the 21st and 22nd in accordance with the order to make the offensive, and two encounter-battles ensued, one of which, the engagement of the Bulgarian I. Army, is generally called the Battle of Selolou, while the other, the battle of Kadhikoi and Buldurgioi of Nov. 10, bears the name of Mahmut Mukhtar's III. Corps, bears the name of Kirk Kilsie.

The front of the Battle of Selolou is defined, roughly, by the line Keremtelia—N. of Selolou—N. of Gechechian—S. of Erjaili—Ortakij—Kilisse. In the area which falls on the front of the 3rd Div., beginning the envelopment of Adrianople. Heavy fighting on the 22nd and 23rd (of which the most notable incident was a night-attack that
penetrated the Turkish front between Gechelelia and Selidu; brought the Bulgarian army victoriously to the Demeranlia-Kukleri-Corps; and crisis在线。This was soon. Teke general. the formation carried on. The permanent works were few, and interior to those of the great fortress, the natural positions afforded by spurs of the Istranja Balkan gave the place advantages of sites which were lacking at Adrianople. The Bulgarians, on their side, advantages to the task with it, a brusque assault or regular siege, or a combination of those methods.

Partly in order to develop the necessary frontage from the outset (in case of battle between Kirk Kilise and the frontier), and partly in order to take the advantage to the Balkan Front, the battle was more difficult than that traversed by the other armies. Radko Dimitriev had formed his two leading divisions into four brigade columns (a) 5th Div. from Ojijan on Keremotika (liaison with I. Army); (b) 4th Div., followed by part of 6th Div. by Devleti Aghach and Eskı Polos on Petra; (c) of 6th Div. with remainder of 6th Div. from Malkochlar by Erkiller on Raklitsa and Kirk Kilise; (d) of 5th Div. from Tonchilar by Ahmak to the Bulgarian line, with its flanks somewhat advanced, ran roughly E.W. from the heights S.S.W. of Petra, through that village, to height 1,506 of Akmach and thence some distance south-east. Further line, in the night, assaults by part of the 5th Div. (5th Div.) penetrated to Karaköy on the one hand and half-way to Raklitsa on the other. And thereupon, worn out by two days’ hill fighting and lacking in internal homogeneity, Mahmud Muktat’s Corps, consisting of his own Kilises and Papas’s Corps, streamed away in panic. The Bulgarians entered Kirk Kilise on the 24th and possessed themselves of immense booty, including 55 guns. As a result, the line of retreat of the army, both the I. and III. Armies stood fast on the 24th on their respective battlefields, while the cavalry division was sent out due south. On the 25th the horsemen reached the Constantinople railway at Baba Eski, next, pushing reconnaissances S. and S.E., they found the country S. of the Erzegovina all clear, but hostile forces between Lule Burgas and Muradi. At the same time the divisional cavalry of the 5th Div. from Kirk Kilise appears to have established the presence of the enemy near Buranovo.

This information, showing that the Erzegovina line had been abandoned, and that Abdalla Khaddar was regrouping his forces and assembling his division in the region of Bugo Vaja. Vaja region, involved a complete change of front for the Bulgarians facing S., they had now to face E. pivoting on the 4th Div. at Kirk Kilise. And while the necessary movements were being carried out, Abdalla Khaddar’s offensive, which had become a lunge for the active corps, and the XVIII. and XVIII. Corps of new formation.

On the 27th the Bulgarian wheel began, but instead of its being carried out on a focused pivot, the pivot itself was allowed to advance eastward, so that, instead of presenting a united line, the Bulgarians formed a loose echelon, left in advance, which led to successive instead of simultaneous engagements. On the evening of that day, the Turkish II. Corps, although weakened on the right, was on the road between Vasa and Bunar Hisar, the II. at Aghach, the I. at Turk Bey and the IV. partly at Lule Burgas, partly at Saksoz, the total front between the Erzegovina and the mountains being about 15,000; of the two corps a march in rear. A general offensive had been ordered.

On the 28th, as a natural consequence, an encounter battle began just E. of the Kara Aghach, in the forest of Sujak, between Mahmud Mustafa and Hissar’s, the Bulgarian line drawing back behind the stream and occupying a line from Chiftlik Teke on the left to Muru Aghach on the right. Thereupon the various corps, advancing, although channeled back to the right of this division, hastened their march and the Adrianople region was ordered up to support the direct, which by a heavy forced march it was able to do on the evening of the 29th. On the 29th, a fierce battle was fought in this region, in which the Bulgarians made the general advance slow and disjointed; the initiative was soon lost, and the battle became one of the parallel fronts along the right flank of the 10th Division. At the same date, the III. Turkish Corps opposite Bunur Hisar and the XVII. Corps on its left, supported by the battles of the XVIII. Corps, were mutually exchanging artillery and counter-attacks with the Bulgarian 5th Div. and part of the 3rd about the W. edges of the forest of Sujak. Against the Bulgarian 4th Div. on both sides of Kara Aghach village, was the II. Corps; against the 6th div., about Turk Bey, were the Turkish IV. Corps. held the line at Lule Burgas and down to the Ergene against the Bulgarian I. Army. Of this army, however, only one division was involved in the frontal fight, and it became evident to the Turks in the afternoon of the 30th that enough enemy forces remained over to roll up their left wing and interpose between the main body and Constantiopolis. Accordingly, Nazim issued orders for retreat. During Oct. 31 and Nov. 1, with various tactical incidents, which the most important was a successful night-attack of the Bulgarians at Turk Bey, the Turks disengaged themselves, beginning from the left, and by the 2nd the three corps on the right were also in retreat. The withdrawal was attended by the Turkish Army, the night of the 12th, a Turkish division for an offensive on the rear of Adrianople without allowing the Turks to retaliate that place.

While the main Bulgarian armies were fighting these battles, the 2nd Div., penetrating the difficult Adriatic country had carried out a vigorous offensive in several directions, as the result of which Adrianople was invested on the S.W. side, Demotika and the coast from Xanthi to Dede Aghach occupied, and two Turkish divisions de-
strayed in a series of "drives" which ended in the relics of this force being surrounded and forced to capitulate at Ferejlik (Nov. 27).

IV. Operations in the Spring of 1913.—The London negotiations of Jan. 1913 were abruptly brought to an end when Enver and the Young Turks, fearing that the Government would, under European

pressure, make peace practically at any cost, carried out the coup d’etat of Jan. 27 (in which the Kaimal Government was overthrown and Nazim Pasha murdered), and denounced the armistice. Hostilities began again (with Greece they had never ceased) on Feb. 3 1913. But they entirely lacked the vigour and dramatic interest of the first campaigns. Practically, the story of the second phase is the final instalment of that of the sieges of Yannina, Scutari and Adrianople. An effort was indeed made by the Turkish field forces in Thrace to detach from the lines of Bulair and those of Chatalja simultaneously with a view to relieving Adrianople, but after locally heavy fighting the Bulgarians succeeded in holding their own on each of these fronts, and thereafter Adrianople was left to its fate.1

The fall of Yannina has already been mentioned. The sieges of Scutari and of Adrianople require, however, a rather more detailed account.

The Scutari Operations.—As has been mentioned already, Montenegro was the first to declare war. The first objective was the old Turkish frontier fortress of Scutari, situated at the point where the Drinasa river flows into Lake Scutari, and consisting only of a castle and a few field-works on the hills surrounding the town. The perimeter measured some 25 m. and the average distance of the works from the town was about two. The works had no deep ditches or sunk water entanglements.

1 Shortly before this the only important naval event of the war had occurred. On Jan. 15, the Turkish cruiser "Hamidieh" had slipped out of the Dardanelles, and from that time till the middle of March she cruised in the waters between Malta, Durazzo and the Levant, raiding commerce as opportunity offered. Meanwhile, the Turkish battle squadron came out of the Straits on Jan. 17, hoping to find the "Averof" absent from the opposing squadron in chase of the "Hamidieh." The Greeks, however, had not committed the expected mistake, and after a long-range duel in which the "Averof" inflicted some damage on the Turkish battleships, the latter returned to the Sea of Marmora, where they remained to the end.

At the outbreak of the war the Turkish garrison was under Hasan Riza Bey, consisted of about 14,000 men (chiefly of the 24th Div.), to which were added, at the last, most of reserves division from Elbasan under command of Essad, 10,000 strong.

With a force such as this, containing few active elements, only a purely defensive policy was possible. The fortress artillery was well manned and provisioned, and the garrison was no long in reserve division under the Egyptian Army, hence its strength.

The operations of the force were described elsewhere. The advance on Scutari began on the morning of Oct. 9. The wide separation of the two Montenegrin columns offered the Turks a tempting opportunity of manœuvre on interior lines, but, for the reasons given above, Hasan Riza was obliged to refrain, and the Montenegrin northern group broke through a line of passively defended positions one after the other. They were, however, so disordered by their victory that they were compelled to halt and refit. On the 19th they recommenced their advance, moving very slowly, and the 30th halted; but on the 2nd they set out again. The fire of the fortress was not until the 28th that they completed. The bridges were then removed the 2nd and 3rd Bdes., then without waiting the arrival of the main body carried the hill called Great Bardanjolt. A Turkish counter-attack on the 30th threw them back, inflicting such heavy losses that the Montenegro were sent back to Vratsa and undertook no further advance till February. The group, which had evidently been clumsily led, took up a position between the Kiri and the Lake of Scutari, some 3,000 yd. in front of the Turkish defences.

The Montenegrin southern group moved on Oct. 9 with its 1st and 3rd Bdes. from Antivari to Katakol, and with the 2nd Bde. from Virpazar along the shore of the lake, both columns meeting with practically no opposition. They then prepared for the attack the Turkish advanced position on hill 660. Their siege artillery opened fire only on Oct. 22, and the Turkish forward line was stormed next day with heavy loss. The assailants now found themselves close up against the main defensive line. The northern group having at this time just been driven off the Great Bardanjolt, coordinated attack by both groups was no longer to be thought of. The southern group therefore remained waiting in the position it then occupied.

On Nov. 19 Vukotic, his work in Novipazar completed, arrived with 6,000 men to reinforce the besiegers of Scutari. He himself took over the command of the whole Montenegrin army, his troops being distributed on both fronts.

Towards the general armistice was concluded; but Hasan refused to recognize it, as the revictualling of the fortress during the armistice had not been agreed to by the Balkan States. However, only minor skirmishes took place in December and January.

The armistice ended May 3. The siege of Scutari was renewed in earnest against the Turkish strongholds of Musulm and the Great Bardanjolt, which had been entrenched and fortified in places by blasting in the rocky soil. The assaulting columns were:

(a) three battalions (1,000 men) of Montenegro's newly raised (at 3rd battalions, (2,100) from the N.E. against its eastern slope, and seven battalions (2,800...
of installations for 5.7 mm, close-defense quick-firing guns under armour, and of concrete shelters and magazines. The general principle of defense adopted was that common to Europe in the period before the rise of the "group" or "Feste" idea—that is, the forts were infantry redoubts for close defense and the fighting artillery was entirely in the intervals. Unfortunately for the Turks many of the "redoubts" were open at the gorge. The whole system of the main line was well wired.

Outside the main position, and coinciding with it on the N.E. front (left bank of the Tunja), was an advanced position, or rather a discontinuous series of field positions on selected sites astride the saddles of ground which separate the rivers (Tunja and lower Maritsa, Maritsa and Arda, Arda and upper Maritsa, upper Maritsa and Tunja). From these advanced positions the Turks had delivered the first sorties above mentioned and to them they had retired under the pressure of the II Army's 3rd and 4th Div.'s advance astride the Maritsa and Tunja on Oct. 22. In the days following, the 5th, 9th, and 12th Divs. extended the investment, and the 11th Div. and siege artillery were brought up via Mustafa Pasha, as well as some aeroplanes. Presently parts of the 2nd Div. lately operating in the Rhodope came up, some by the Arda and some via Demotika on the S. side. On the other hand, both the 3rd and the 9th Divs. were withdrawn to join the field army in the crisis of Lake Burgas. After establishing their line generally close up to the Turkish advanced positions (in the course of which, on Oct. 25, Kortal Tepe was captured, and Papus Tepe won and lost again), the Bulgarians sat down to await the Serbs, whose II Army, set free by the victory of Kumanovo, was being withdrawn from the Vardar to assist their allies. Already on Oct. 7 some Serbian troops had arrived and on Oct. 31 Gen. Stepanovich took over the whole W. front of the investment, and then had the 3rd, 27th, and 14th Divs. converge on the upper Maritsa and Danube II, between upper Maritsa and Arda. Gen. Ivanov, commanding his II Bulgarian Army as well as the whole siege force, had his 8th Div. between Arda and lower Maritsa and the 11th with part of the 2nd in the broadest sector, the eastern.

At this point the armistice suspended operations, but Shukri Pasha was not authorized by its terms to retreat his garrison and the defenders continued therefore to consume their resources. After hostilities were resumed on Feb. 3 it soon became evident, from attempts at sorties and from increase of desertion, that the garrison was weakening, and it was decided to force the attack.

Wont of transport resources, however, delayed the preparations till the third week in March 1913, when—parts of the 3rd, 9th and 4th Divs. having been brought into the Bulgarian II Army from Chatalja—50,000 Bulgarian and 30,000 Serbian infantry were actually available for the attack, which would be prepared and covered by the 125 Bulgarian siege guns and howitzers of 12 and 15 cm. calibre (the latter, as mentioned above, being capable of penetrating the parapet vaults) as well as 250 or more field guns. At this period possibly 50,000 of Shukri's original 60,000 combatants were still available for duty. There were 216 field and 96 siege guns (including some 21-cm. mortars) distributed in the defenses.
The E. front was chosen for attack. The preliminary bombardment was mounted on March 24, and in the night of the 24th–25th the whole of the advanced line on the E. front was stormed, on a 6-ten-mile front for the Bulgarians had made a good deal in the captured positions, but Gen. Ivanov determined to push home the assault on the main position on the night of the 25th–26th, an advance in an approach march to broad daylight and in torrentially heavy rains.

The assault was duly delivered in the night, and came to a standstill on the Turkish wire, save at the point where the 10th Bulgarian Regiment (5,000,000 and 7,500,000) on the outposts along S. (from the basin) broke into Fort Ayi Yolu, the second work from the N.E. salient of Arnavutkoy.

At dawn the regiment found itself isolated but in possession of the fort, and the gaps in the outer gorge of the row of forts tempted the audacious commander to strike out right and left along the ridge. Thus he cleared the way for unit after unit held up at the frontal wire, and, capturing each step of the ridge, the whole of the accompanying field batteries, cleared the whole line of the eastern forts by 8 A.M. on the 26th. meantime the Serbians had captured Papas Tepe, though with considerable losses, and at other parts of the front the local attacks were delivered. Shuker's position was hopeless, and he surrendered about midday, with some 60,000 men and all his matériel. This great triumph cost the Bulgarians on the E. front 6,300 killed and wounded, and on the S. side 1,700, or 8,000 in all, while the Serbians lost 1,000 in the Papas Tepe sector and 400 elsewhere—a total loss to the allies of 9,400.

V. The Second Balkan War, 1913.—The Turkish war having again ended through the dismemberment of Austria, the peaceable succession of Adrianople, peace negotiations were resumed in London, and in these negotiations the settlement of peace as far as Turkey was concerned, was, it may be said, the least of many problems. Meanwhile, the Bulgarians had sought in the Balkans (from April to August) to make the most of internal explosion, but the Concert of Europe was trying to create a new state of Alliance in the midst of a three-cornered diplomatic contest between Austria-Hungary, Italy and Russia. Further, Bulgaria was on the point of intervening in order to secure herself against the consequences of Bulgarian agrarianism, and the internal politics of Turkey became more confused than ever. In the end the presence of London, signed on May 30, lacked every element of reality.

Already Serbia had drawn her western forces into the Ochre Pole area, to dispute possession of the debatable region which Bulgaria claimed and was determined to protect by the absence of Adrianople, was extricated as rapidly as possible lest it be isolated and disarmed in the territory of its allies. The Greeks, who had concentrated the bulk of their forces in roadless Epirus for the siege of Yanina, lost no time in bringing them down to the coast and shipping them to Salonika. For their part the Bulgarians used the railway lines Adrianople-Sofia and Dede Agach-Seres (the latter secured by the conquest of the coastal region by the 7th and 2nd Divs. in the first campaign) to bring most of their forces into Macedonia.

They were deployed along a "line of demarcation" which was a battle line in all but name. Only one division remained in Adrianople and some militia on the Dobruja frontier.

The origin of the war, as between Bulgaria and Serbia, lay in the non-observance by Bulgaria of the original treaty stipulation that Serbia should not and should not command in Macedonia with all the forces of men. Having failed to fulfill her part, she now claimed the territory about Uskub, Kumanovo, and Strip in virtue of other clauses of that treaty. The clash between was in no way to conciliate, all the less so since her advance to the Adriatic had been forbidden by the Great Powers. As between Bulgaria and Greece, the former's claim to Salonika seems to have had no better basis than a desire to possess it. As already mentioned, the Bulgarian 7th Div., in arriving first, seized Struma side a few days after the Crown Prince had fought his way into Salonika from the W., had lost no time in publicly claiming ownership, and it was with hardly concealed joy that the Greek Government was heard to request a transport to this division by sea to the Thracian theatre.

On all these matters bargaining might possibly have reached some solution, and there was no lack of proposals to justify Bulgaria's claim in Macedonia. But the Bulgarians had skillfully exploited their primacy during the first war to induce the European press and public to regard Serbians and Greeks as mere satellites, and, as so many available the issue on the Macedonian campaign in Macedonia with all the forces of men. Having failed to fulfill her part, she now claimed the territory about Uskub, Kumanovo, and Strip in virtue of other clauses of that treaty. The clash between was in no way to conciliate...
time the Bulgarian forces between Shtip and Krivolak were slowly driving back Timok II. to the Bregalnitsa, but it was now too late for this to influence either the main battle or that of the Greek front. On the latter, the Bulgarian advance had come to a standstill, as soon as King Constantine had brought up his reserves, and the
counter-offensive opened on the 3rd. His left (10th and 3rd Divs.) retook Gevgeli, his centre (4th, 2nd, 5th) Kilglass, and his right (1st, 6th, 7th) drove back the Bulgarian left on Nigrita and also eastward on the Seres road (July 2-4). On July 7 the Greek right reached the Salonika--Drama railway, and their left from Gevgeli carried the pass over the Belashitsa which leads to Strumitsa. Thus Ivanov was cut off from the railway, and his only line of retreat lay up the narrow Struma valley to Jumaya.

Yielding to necessity, the Bulgarian forces on the Vardar withdrew, or it was too late, into the Belashitsa valley, while those pursuing Timok II. on the lower Strumitsa halted and drew back.

The opportunity which thus presented itself to the Serbian III. Army of interposing between Ivanov and Bulgaria led to a regrouping of the Serbian forces for the benefit of this army, which, pursuing its advantage, drove back its opponents towards the line of mountains in the upper Bregalnitsa bend (Obuna--1340-Grelena).

But the Bulgarians, in order to relieve pressure and to keep their hold upon Western opinion, seized the initiative again while the regrouping was in process and the Greeks had hardly yet entered the Struma and Strumitsa valleys.

Their new offensive was twofold—local attacks by the I. and V. Armies on all the routes leading into Old Serbia, and heavy counter-attacks on the front of the Serbian I. Army. The first, made with columns of varying strengths on the routes leading to Zajecar, Kynastevats, Payot and Vlasina, was repulsed by the Serbian I. Army after some initial successes, and was over by the 18th. The second was more serious, and it seems that the process of building up the strength of the Serbian III. Army opposite Kuchen was not only suspended but actually reversed to our disadvantage; however, the Bulgarians were repulsed here also, and retired to the line of frontier mountains (Golemi Vrh--Bozjeritsa--Rujiang--Sivkobila), more or less in touch with the right of the forces in the mountains near the Bregalnitsa bend.

By this time the Greeks were in possession of the Strumitsa basin and had made some progress up the Struma. But Ivanov had obtained an opportunity that he could not have gained by his own efforts to extricate the various forces of the Bulgarian left which were scattered from the Vardar to the Struma.

The new allied offensive, therefore, began all along the Serbian line on the 15th, and starting on the battle-front above mentioned (Golemi Vrh--Sivkobila--Obochina), resolved itself into a series of local combats with the object of cutting off as much as possible of Ivanov's rearguard detachments and of making strategic connexion with his right flank at Pchelchevo. At this stage, indeed, a bold strategy was hardly required, for already Rumania had declared war on Bulgaria and had begun an unopposed march on Sofia, while the Turks at Chatalja and Balik, ignoring the Treaty of London, reoccupied Armenia without firing a shot.

Yet this relative inactivity of the Serbs gave the Bulgarians one more opportunity, which they seized. Using a manoeuvre which was destined to become a familiar practice in subsequent campaigns, but, at that date and in that country of mountains and primitive communications, was conspicuously daring and novel, they transferred Kutniev's I. Army from the old Serbian frontier (Vidno--Piroet) to the Bulgars' I. Army, from the latter, by Western opinion, seized there, placing the reorganised and strongly fortified flank of the advancing Greeks. On July 25 Ivanov and Kutniev simultaneously attacked the leading troops of the Greek central or Struma column by the main body was clear of the Kresna defile. But the capacity of resistance of the Greek troops, exploiting a mountain country for which their aptitude was remarkable throughout these campaigns, enabled them to weather the first crisis; they were reinforced from the left as well as from the rear, and on the night of the 26th--27th the Bulgarians withdrew towards the Jumaya Pass.

The venture was at an end. Surrounded by hostile columns converging on Sofia from every quarter, Bulgaria yielded on July 31, and on Aug. 10 was signed the Peace of Bucharest.

BIBLIOGRAPHY. — The outbreak of the World War in 1914 prevented all the combattants of the Balkan wars from producing official histories, and the only sources available are books and papers published immediately after the operations. Concise military accounts of the first war in all theatre are Boucaud's Guerre Turco balkanique and Immanuel's Balkanbrieg. For the Macedonian campaign and Scutari, by far the best authority is the French general staff publication Revue milit. des armées étrangères (monthly numbers Feb.--July 1914). For the campaign of 1912 in Thrace, A. de Pennefl's Campagne de Thrace is the best contemporary account; an interesting study by Maj. (afterwards Brig. Gen.) P. Howell, The Campaign in Thrace (1913), stops short before Chatalja. In 1915 Gen. Palet produced a volume, Guerre des Balkans, which assembles much of the known evidence. The campaign of the second war of 1915 little of military value has been published. A summary of dispositions, movements, and events will be found in Handel's Annual, 1914, pp. 369-71. For the Serbian part in both wars A. Kutschaec's Die Serben im Balkankrieg is useful and containing official information.

BALL, SIR ROBERT STAWELL (1849-1913), Irish astronomer, was born in Dublin July 1, 1849. Educated at Trinity College, Dublin, he was appointed in 1865 assistant to the Earl of Rosse's observatory at Parsonstown, and whilst there he discovered four spiral nebulae. On the death of Lord Rosse two years later he became professor of mathematics in Dublin University and in 1874 Royal Astronomer of Ireland. This post he held until 1898; but in 1892 he was also made professor of astronomy and geometry at Cambridge and director of the university observatory. From 1897 to 1901 he was president of the Royal Astronomical Society. He was knighted in 1886. He was an admirable lecturer and writer of popular books on his subject, as well as of more learned works such as his Treatise on Spherical Astronomy (1885) and Treatise on the Theory of Series (1900); and he was a congenial figure in all circles. He died at Cambridge Nov. 25, 1913.

1 The right, moving more or less independently, was at Dobrinish in the Mesta valley. The left had reached Pchelchevo.
BALL, THOMAS—BALLISTICS

BALL, THOMAS (1819-1911), American sculptor (see 3.263), died at Montclair, N. J., Dec. 11 1911.

BALLIN, ALBERT (1827-1918), German merchant and one of the most eminent representatives of German commercial interests, was born Aug. 15 1857 at Hamburg. After having completed his mercantile training he organized the 'tween-deck (emigrant) traffic of the Carr Line. He next undertook the management of the passenger traffic of the Hamburg-America Line and became director and soon afterwards director-general of that enterprise, the expansion of which was essentially his work. The share capital of the Hamburg-America Line was increased tenfold during his management. The network of its service was extended over the whole world, largely by the acquisition of a number of other lines. Ballin succeeded, by means of agreements with other German shipping companies, in developing German shipping on a grand scale; he was likewise the author of the German-American shipping agreement of 1902. He was regarded as enjoying the special confidence of the Emperor William II., who employed his services as an expert in all matters of shipping and commerce. Ballin died suddenly—heart-broken, it is said, by the military, political and commercial collapse of Germany—at Hamburg on Nov. 9 1918.

BALLISTICS (see 3.276*).—I. INTERIOR BALLISTICS. Interior Ballistics has as its province the behaviour of a projectile, its propellant, and the gun from which it is fired, the moment of firing and the moment at which the shell leaves the muzzle of the gun. From its nature it is a subject in which the synthesis of experimental results into general laws is a matter of great difficulty and, in its present stage of development, striking differences of opinion still exist on fundamental points. A review of the work published after 1910 illustrates some of these differences.

In France the well-known system of Gen. P. Charbonnier, published in 1908, has been modified as well as elaborated by G. Suguot (Mémorial de l’Artillerie navale, 1913). Charbonnier, for French nitro-cellulose powder in long flat strips, assumes a rate of burning directly proportional to the pressure, and that the grains burn with a distinctly decreasing surface, while Gen. Gossot and R. Liouville (the exponents of the other leading French system) assume, for the same propellant, a rate of burning proportional to the pressure to the power of two-thirds, and a practically constant burning surface.

In Italy Madaschi’s revision (published in 1914) of Bianchi’s Notizie Fondamentali di Balistica Interna sets forth a very comprehensive system on different lines to that of Charbonnier, although it has some points in common such as the law of burning and the treatment of the resistance of the driving band.

In the U.S. official Text Book of Ordnance and Gunnery (1917) Ingalls’ system of Interior Ballistics has been replaced by that of Tschappat, who again has adopted the same law of burning and treatment of band resistance as Charbonnier, but then diverges entirely from his methods.

Published in England we may note Sir George Hadcock’s "Internal Ballistics" (Proc. Royal Society, A, vol. 94, London 1918), in which the treatment of the resistance of the band is extended to include a separate phase while the band is actually being engraved.

The existence of such important divergencies between published systems would in any event make it difficult to present the subject in brief and definite form. But there is also a further obstacle in the fact that the connexion between Interior Ballistics and the design of artillery materiel is so intimate that work of the resulting work is still considered by the naval and military authorities of most countries, if not of all, as to a great extent confidential.

On the other hand the experiences of the World War emphasized the importance of a due appreciation of the general principles of Interior Ballistics not only for purposes of design, but also for the intelligent and efficient employment of artillery materiel. To establish such an appreciation on a concrete basis, working formulae are a necessity, as without them the magnitude of the effects cannot be studied, but the formulae should be comparatively simple, or from their cumbersome nature they will fail in their object. Formulae suitable for this purpose, although of a purely empirical nature, are available, and it is feasible to present and illustrate the leading principles with the aid of these simple formulae alone.

Monograph Formulae for Velocity and Pressure.—Interior Ballistics is concerned with the circumstances attending the motion of the shell in the bore of the gun. Considering these circumstances in a general way, when the charge is ignited, gas is evolved from the propellant, and this gas exerts a gradually increasing pressure on the base of the shell. When a certain pressure has been developed the shell starts to move and travels up the bore with continually increasing velocity until it leaves the muzzle of the gun with a certain muzzle velocity. During this time the pressure at first increases comparatively rapidly until a certain pressure, the maximum pressure, is reached. The pressure then gradually decreases to the muzzle, the pressure when the shell leaves the muzzle being known as the muzzle pressure.

Modern propellants are for the most part colloids, and the grains composing the charge have some more or less definite geometrical shape. Typical velocity and pressure curves for such propellants will be found in the earlier article BALLISTICS (see 3.276*).

A charge made up in this way is in practice ignited in the chamber of the gun by means of a small additional charge of black powder, the igniter (which in turn has been ignited by the striking of a percussion cap), so that the whole of the surfaces of the grains are set alight or inflamed as nearly as possible simultaneously. For such colloid propellants the "Law of Burning by Parallel Layers" is well established. This law states that at any instant of the burning of the grain the thickness burnt through in the direction normal to the exposed surface is the same over the whole surface, or in other words that the grain is diminished by an equal thickness in all directions.

The rate of burning of the propellant is a function of the pressure, and the greater the pressure, the quicker the grain will burn. Consider now two charges of the same weight and made up of (a) comparatively small and (b) comparatively large grains of the same geometrical shape.

For (a) the surface exposed when the charge is ignited (the "initial surface") will be greater than for (b), and the emission of gas will be greater to start with. The pressure and the rate of burning will increase comparatively rapidly, and the whole charge will be consumed sooner than in the case (b). In the case of (b) the total weight of gas emitted will be the same, but the mode of emission will be different. The initial surface is not so great, so that at the start the pressure will rise less rapidly and the combustion will be prolonged over a longer period and will be less than for (a), but will decrease more slowly.

Coming to the geometrical shape of the grain, the different forms employed may be divided into three main groups:

(i) Those which burn with a practically constant surface, such as long flat tubes,

(ii) Those which burn with a practically constant surface, such as long flat tubes,

(iii) Those which burn with an increasing surface to a certain stage, the grain then burning up to the bore, and the increased burning rate of the charges quite different from the original shape. An example of this type is a cylindrical grain pierced longitudinally by a number of holes.

Cordite M.D.T. is an example of Group (ii). The length of the tubes of circular section of which the charge is composed is so great compared with their thickness, that the burning of the end may be neglected and the burnt later. The maximum rate of combustion is practically constant throughout the burning, as the tubes grow smaller in diameter. The proportion of the whole thickness burnt through at any time is the same as the proportion of the weight burnt, as the weight of the charge is so small compared with their thickness, that the burning of the end may be neglected and the burnt later. The maximum rate of combustion is practically constant throughout the burning, as the tubes grow smaller in diameter. The proportion of the whole thickness burnt through at any time is the same as the proportion of the weight burnt, as the weight of the charge is so small compared with their thickness, that the burning of the end may be neglected and the burnt later. The maximum rate of combustion is practically constant throughout the burning, as the tubes grow smaller in diameter. The proportion of the whole thickness burnt through at any time is the same as the proportion of the weight burnt, as the weight of the charge is so small compared with their thickness, that the burning of the end may be neglected and the burnt later. 

Cordite M.D., which is made up in long cords of circular section, is an example of Group (i), and other forms frequently employed are long flat strips of rectangular section (such as the French B.N. powders), or square flat grains (such as those of the R.G. by the Société Charbonnier).
The multiperforated grains in which American nitrocellulose of the larger sizes is made up, are an example of (iii). The cylindrical grain has seven equal longitudinal perforations; a typical cross section is shown in fig. 1.

One of the perforations coincides with the axis of the cylinder, and the others are disposed symmetrically about the axis, their centres forming a regular hexagon and being so arranged that the least dimension of the grain or "web thickness," which is the least distance between any two adjacent circumferences, is the same throughout.

During the first phase of the combustion, i.e., before the grain breaks up, the grain burns with an increasing surface, the thickness burnt through at any time being greater than the percentage of the whole weight of the grain consumed. When the web thickness is burnt through, the grain breaks up into twelve slender triangular pendants, with curved sides known as "slivers." The slivers will burn with a decreasing surface in a very similar manner to long cords.

The less the percentage of the whole weight of the grain consumed compared with the percentage of the thickness burnt through, the more "progressive" is the shape said to be. Fig. 2 illustrates the burning of different forms of grain in a gun. It shows the pressure-space curves for a charge of the same weight made up of long cords, long tubes, and multiperforated grains; the diameter of the cord, thickness of the tube, and web thickness of the m.p. grain are so arranged that the whole charge is just completely consumed at the muzzle, i.e., after the same travel of the shell; the same shell is supposed to be fired from the same gun with these three different nature of charges.

The muzzle velocity will be the same in each case, but the pressure curve will be different. For the charge to be completely consumed at the muzzle the diameter of the cord and thickness of tube will be the same, but the web thickness of the m.p. grain will be considerably less, as after this is burnt through there are still the slivers to burn.

The point where the web thickness of the m.p. grain is burnt through and the grain breaks up into slivers, is shown on the diagram. From this point the pressure drops rapidly, owing to the change from an increasing to a decreasing surface of combustion, until it runs into the curve for the charge which it follows to the muzzle.

If we increase the diameter of the cord and the web thickness of the m.p. grain (keeping the weight of the charge the same) the maximum pressure will be lower, but the muzzle velocity will also be lower as the charge will not be consumed in the gun.

The main problem of Interior Ballistics may now be stated as follows: Given the necessary particulars of the gun, charge, and shell, to determine the corresponding values of the velocity of the shell (with special attention to the muzzle velocity), the pressure of the charge, the m.p. grain (with special attention to the maximum pressure), and the proportion of the charge burnt (with special attention to the point of complete combustion), at any point of the travel of the shell up the bore.

This is subsidiary to the search for an inverse nature required for considering questions of design and analyzing firing results will also suggest themselves.

The physical phenomena, as will be readily understood, are of a very complex nature; besides the energy expended in propelling the shell from the muzzle with a certain muzzle velocity, we have the work expended on the charge, on the gun and mounting (recoil) and frictional losses from engraving the bore, and forcing the driving band into the rifling grooves ("engraving") the web breaks (as before), and overcoming friction up the bore. There is also the heat lost by conduction.

The charge, besides the main dimensions ("calibre," "chamber capacity," and "shot travel"), variations in the design of the rifling and the state of wear of the bore generally may have an appreciable effect on the results. This does not exhaust the possible causes of variation, and in fact two guns of the same design, even when new may not give the same muzzle velocity under conditions which have carefully been made as nearly identical as possible.

As regards the charge in addition to the nature of the propellant and form of grain, we may have to take into account the circumstances of the ignition and the temperature of the charge as fired. Two samples or "lots" of the same propellant, however carefully prepared and under identical conditions, as nearly as may be, may give different ballistics in the same gun, and even if they give practically the same results when new, the matter may be complicated later by the length and conditions of storage.

As regards the shell, besides the weight, the design of the driving band may have to be taken into account, as this may affect its resistance.

It must be understood that though all these causes and others not touched on may appreciably affect the results, they by no means all do so in all circumstances, from the point of view of their practical effect on shooting; indeed, some of them may require very refined experimental methods even to detect them. For this reason a due appreciation of their relative importance in any particular case is very desirable and can be obtained only by close study and wide experience.

In the extreme complexity of the physical phenomena, even under carefully standardized conditions, it may be doubted if a complete solution of the problem is possible, but various systems more or less complete for an approximate solution have been proposed and worked out. Some of these are referred to above. The underlying theory is of necessity difficult and the calculations involved laborious, the complications increasing rapidly with the discussion comprehensiveness attempted.

None of these systems up to date can be said to have gained general acceptance, and in fact serious divergencies on the most crucial points will be found in the different authorities. All that will be attempted here will be to give a method of obtaining certain empirical formulae which have been and still are considerably used for practical calculations of muzzle velocity and maximum pressure. They are of a monomial type and with their aid, given the muzzle velocity and maximum pressure known to be obtained with certain combinations of gun, charge and shell, we can endeavour to predict the changes in ballistics which will result from variations in the data which give the known results.

The following notation will be employed:

\[ d = \text{calibre in inches} \]

\[ G = \text{chamber capacity in cubic inches} \]

\[ V = \text{muzzle velocity in feet per second (f/s)} \]

\[ W = \text{weight of shell in lb} \]

\[ M = \text{weight of charge in lb} \]

\[ L = \text{least dimension of the grain in inches} \]

\[ \text{This is only for illustrative purposes. In practice the charge should be completely consumed before the shell reaches the muzzle.} \]

\[ \text{In practice the maximum pressure is generally the limiting factor as we must not exceed the safe working pressure of the gun, and the} \]

\[ \text{endavour to get the required muzzle velocity combined with good} \]

\[ \text{regularity; for this it is desirable that the muzzle pressure should be} \]

\[ \text{low and the charge completely burnt well back in the gun.} \]

\[ \text{The best practical combination of form and weight of charge for this purpose is the design of the} \]

---

"Ballistics" refers to the study of the motion of projectiles and the forces acting on them. The passage discusses the complexities involved in calculating and predicting the behavior of gunpowder and projectiles, highlighting the challenges in obtaining accurate and reliable results.
by supposing the gun under consideration, together with its shell and charge, to be expanded or contracted symmetrically until its calibre is equal to 1 inch. Corresponding to G, W, S, M, and L, for the gun calibre d in., we have for the standard gun

\[ G = \frac{G}{d^2}, \quad S = \frac{S}{d}, \quad M = \frac{M}{d}, \quad W = \frac{W}{d}, \quad L = \frac{L}{d} \]

V and P will remain unchanged.

The working formulae for muzzle velocity and maximum pressure will be based on the assumption that they can be put in the form—

\[ V = K_G S^s W^t M^m L^n \]

\[ P = K_P S^{s'} W^{t'} M^{m'} L^{n'} \]

Where \( s, t, m, \) and \( l \) are empirical indices, positive or negative integral or fractional, and \( K_G, K_P \) empirical constants. The values of the indices denoted by the same letter are different in (1) and (2). These formulae are to be regarded as purely empirical, but with a due appreciation of their possibilities and limitations they will be found very useful working tools.

Assuming as the result of experience, suitable values for the indices, we can from known firing results (muzzle velocity and maximum pressure) for a certain gun, charge, and shell evaluate \( K_G \) and \( K_P \) of (1) and (2) by simple calculation with a table of logarithms. Then by a reverse process, using the values of \( K_G \) and \( K_P \) so obtained, we can calculate the muzzle velocity and maximum pressure to be expected with another gun, shell, and charge (of the same propellant) made up of grains of the same form, inserting the appropriate values of \( G, S, W, M, \) and \( L \) in (1) and (2).

The following tables have been drawn up as a guide to values of the indices which will be found suitable for guns, at any rate for trial purposes, with the following propellants:

- Long cords of Cordite M.D. (M.D.)
- Long tubes of Cordite M.D.T. (M.D.T.)
- Short tubes or m.p. grains of nitrocellulose (N.C.T.)

An example to illustrate the use of these tables will now be given:

A 6-in. gun, chamber capacity 1600 in., shot travel 250 in., fires a 25-lb. shell with a charge of 25 lb. of M.D., diam. of cord 0.2 in., gives a muzzle velocity of 2650 fps with maximum pressure of 16 ton/in². What muzzle velocity and maximum pressure may be expected from a 3-in. gun, chamber capacity 600 in., shot travel 140 in. with a 55-lb. proj. shell and a charge of 10 lb. M.D., diam. of cord 0.12 in.? For the 6-in. gun we have:

\[ G = 1600, \quad G_7 = 74, \quad S = 416, \quad W = 100, \quad W_7 = 463, \quad M = 150, \quad M_7 = 150, \quad L = 0.2, \quad L_7 = 0.033, \quad V = 2650, \quad P = 16 \]

From (1) and Table I—

\[ V = K_G G_7^{-s} S^{s} W_7^{-t} M_7^{m} L^{n} \]

Taking logarithms and rearranging, 

\[ \log V = \log K_G + 0.25 \log G + 0.6 \log S - 0.2 \log W - 0.4 \log M - 0.15 \log L \]

whence

\[ \log K_G = 3.524 \]

Similarly from (2) and Table II—

\[ P = K_P G_7^{-s'} S^{s'} W_7^{-t'} M_7^{m'} L^{n'} \]

whence

\[ \log K_P = 2.645 \]

Then for the 3-in. gun:

\[ G = 600, \quad G_3 = 4.8, \quad S = 28, \quad W = 55, \quad W_3 = 14, \quad M = 10, \quad M_3 = 0.8, \quad L = 0.12, \quad L_3 = 0.024 \]

and

\[ \log V = \log K_G + 0.25 \log S + 0.6 \log W + 0.15 \log G - 0.2 \log M - 0.4 \log L \]

which, using the value of \( \log K_G \) found for the 6-in. gun, gives 

\[ V = 2350 \] fps

Similarly using the value of \( \log K_P \) found for the 6-in. gun we get for the 3-in. gun

\[ P = 18.6 \text{ ton/in}\² \]

It must not be inferred from this that for any propellant we can arrive at values of \( K_G \) and \( K_P \) and the indices \( g, s, w, m, l \), which will reproduce the firing results in all circumstances. Investigations to determine such fixed values once for all, will soon lead to disappointment. It must be remembered that we have only embodied in the formulae differences in weight, calibre, chamber capacity, shot travel, weight of shell, weight of charge, and dimensions of the propellant. We have not taken into account any of the other causes of variation touched on above.

When we analyze firing results by means of (1) and (2) all these neglected factors are as it were embodied in the values of \( K_G \) and \( K_P \) arrived at, and these values of \( K_G \) and \( K_P \) and also the values of the indices are only suitable for application in other cases in which the effects of the neglected factors are proportionally similar.

The density of loading,1 and the position of the point of complete combustion of the charge will also have an influence, and an adjustment of constants and indices may be necessary for widely different densities of loading, and according as to whether the charge is completely consumed well back in the gun, or whether there is a proportion of the charge still unburnt when the shell leaves the muzzle.

The values of the indices in Tables I and II, are adjusted for the average conditions of modern practice,2 and if the above warning is kept in mind and the formulae used in an intelligent manner they will, as already stated, be found extremely useful working tools.

If only a few of the data vary it is not necessary to work with the complete formulae (1) and (2). Thus if we are dealing with the same gun and shell and the same propellant of the same form and size, and only wish to investigate the effect on the muzzle velocity of differences in weight of the charge, we need not introduce the standard gun and work out the constant \( K_G \) but may write

\[ V'' = \left( \frac{M'}{M''} \right)^{g''} \]

where the muzzle velocity \( V'' \) is known for a charge of weight \( M' \), and we want to find the velocity \( V'' \) for a charge \( M'' \). Again if we are dealing with differences in weight of both charge and shell we may employ

\[ V'' = \left( \frac{M'}{M''} \right)^{g''} \left( \frac{W'}{W''} \right)^{w''} \]

As an example—a gun gives m.v. 2500 fps with full charge 12 lb. M.D.T., what will the m.v. be with a 3/4 charge of 9 lb.?

Here \( V'' = 2500 \) for \( M'' = 12 \), and we have to find \( V'' \) for \( M'' = 9 \) from

\[ V'' = \left( \frac{M'}{M''} \right)^{g''} \left( \frac{W'}{W''} \right)^{w''} \]

we have

\[ V'' = \left( \frac{12}{9} \right)^{g''} \left( \frac{W'}{W''} \right)^{w''} = 1.22 \]

Therefore

\[ V'' = 2500 \times 1.22 = 2050 \text{ fps} \]

When the variations in the data are comparatively small the monomial formulae may be replaced by a simple percentage approximation which will give sufficient accuracy while reducing the calculations to little more than easy mental arithmetic. The following tables derived from the indices already employed with the monomial formulae give the information necessary for such percentage calculations.

1 The density of loading is defined as the the "ratio of the weight of the charge to the weight of a volume of water just sufficient to fill the chamber." This is given by 37.7 G/M. The greater the density of loading, the less the "initial air space" (the volume of the chamber not actually occupied by the grains of the charge).
2 These indices are suitable for ordnance. For rifles they require considerable modification, see Hardcastle "Monomial Formulae for Pressure and Velocity for Ordnance and Small Arms," Royal Artillery Journal, vol. xiii.

</tbody>
</table>

Example. A gun gives m.v. 1680 f/s for max. press. 15.5 ton/in² with a charge of 20 lb, N.C.T. What decrease in charge will give a velocity of 1660 f/s, and what will be the corresponding pressure? A change from 1680 to 1660 f/s is a decrease of 1.9%. From Table III, a decrease of 10% in weight of charge will decrease m.v. by 6%. Therefore a decrease of 1.9% will correspond to a decrease in weight of charge of $\frac{10 \times 1.9}{6} = 1.98$ or 0.936 lb.

From Table IV, 10% decrease in charge decreases P by 16%. Therefore 1.98% decrease in charge decreases P by 3.16%, or 0.049 ton/in². Hence the maximum pressure for V = 1660 f/s will be about 15 ton/in².

For the experimental determination of any of the indices, say the velocity index m, we require a series of firing results in which the corresponding quantity M has alone been varied, and the muzzle velocities recorded.
The logarithms of the corresponding values of V and M are then plotted as ordinates and abscissae and a straight line fitted to the points as closely as possible. The slope of this line, as measured by the tangent of the angle which it makes with the axis of M, gives the value of the index.

As an example fig. 3 shows the plotting by this method of a number of firing results for a certain gun with different weights of charge, all the other particulars being kept the same.

The firing results plotted were:

The points obtained are shown by small circles.

It is then evident that a straight line, as shown on the diagram can be drawn which will pass very nearly through all the points.
The best straight line could be determined mathematically by the "method of least squares," but in practice all that is necessary is to take a piece of thin black thread and move it about on the diagram estimating the best position by eye. Drawing the best straight line determined in this simple manner we can read off the index m. In the present case we thus arrive at the result that m = 0.7, so that

$$V = \frac{M^V}{M^M}$$

FIG. 3.

Connexion between Interior and Exterior Ballistics.—When the shell leaves the muzzle of the gun and starts to describe its trajectory it enters the domain of Exterior Ballistics, but the condition in which it leaves the muzzle, particularly as regards initial velocity and steadiness and the round-to-round variations in these conditions, will have an important influence on the behaviour of the individual rounds, and on the dispersion of a group of rounds fired from the same gun at the same elevation.

These initial conditions are determined by what happens as the shell travels up the bore and at the moment it leaves it, and it is therefore appropriate to touch upon them here.

Thus, if the shell leaves with a large initial "yaw" (inclination of the longer axis to the direction of motion of the centre of gravity), the range will in general be less than that which would be obtained if the initial yaw were small. Again, from the point of view of dispersion, even although all the shell were equally steady, the greater the round-to-round variation in the muzzle velocity, the greater would be the dispersion in range.

From the point of view of accuracy, as measured by the small dispersion of a group of rounds fired at the same elevation, the round-to-round variation in the initial conditions should be as small as possible. As far as regularity in use is concerned, the charge is a main factor, but the driving band and the state of the bore also have an effect.

Considering the charge, the constituents of this should be, in the first place, as homogenous as possible, both as regards composition and dimensions. Further, for the same shape of grain the longer the travel of the shell before the charge is completely consumed, the more sensitive is the muzzle velocity to variations in size, etc., so that the further back the charge can be burnt the better, or the smaller the size that can be used the better. This is a course limited by the muzzle velocity required; the smaller the size the less muzzle velocity can be obtained for the same maximum pressure.

When we come to consider the degree of steadiness with which the shell leaves the muzzle and the variations in this, while there is no question as to its importance, the conditions which govern it and their relative importance are by no means well established.

The shell has to be given rotation, by means of the rifling grooves, in order to maintain an end-on position in its subsequent flight, and, in the first place, it is clear that it must be satisfactorily centred when rammed home, and that the design of the rifling grooves need be mechanically suitable for imparting the rotation in an efficient manner.

Further we have as possible influences on the conditions of emergence, the effect of the blast of the gases as they are released at the muzzle, and the effect on the shell of the vibrations of the barrel.

As to the former the violence of the blast effect will depend on the muzzle pressure, and the general practice is to keep this as low as possible so as to decrease the chances of trouble from this cause. As to barrel vibrations, although some experimental work has been done in the case of rifles, there is very little really known as to the behaviour of ordnance in this respect, and their influence on the state of departure of the shell. It is a matter which undoubtedly calls for research, but the experimental and theoretical investigation bristles with formidable difficulties.

Bibliography.—A list of some recent works and papers on the subject is appended. It is not intended to be complete but covers a good deal of ground, and may be useful in suggesting a course of reading which might be undertaken by anyone intending to study the subject seriously. G. Bianchi, Nostioni Fondamentali di Balistica Interna (1914, 2nd. ed., revised by G. Madauchi); P. Charbonnier, Balistique Intérieure (1908); Desmarestes, "Note sur l'état actuel des balistiques" (Revue de l'Institut de Mécénat, vol. 85. April 1920; Gosset and P. Liouville, Les Effets des Explosifs (1919); A. G. Hardcock, "Internal Ballistics," Proceedings of the Royal Society A, vol. 110, London, 1918; G. Sugost, "Les Forces de Charbonnier," Mémoire de l'Institut de Navigation (1913); W. H. Tschappat, Text-Book of Ordnance and Gunnery (1917).

(R. K. H.)

II. EXTERIOR BALISTICS. Previously to the World War, and under the practice in vogue in 1910, guns proper were used only in direct fire at elevations below 20 degrees. Fire from guns, howitzers or mortars, above 15° elevation was known as high angle fire, and fire from howitzers at angles of elevation below 15° was known as curved fire. Howitzers were fired at elevations up to 45°; mortars were used at angles of elevation up to 65°; but howitzers and mortars had low muzzle velocities, relatively short ranges, and the maximum ordnates of their trajectories were comparatively small.
From 1915, however, the nature of the fighting on the western front called for the development of extreme ranges in all artillery, and the easiest and quickest method of increasing the range of a given gun was to modify or redesign its mount so as to permit the piece to be fired at the angle of elevation that would produce the maximum, or at any rate the necessary, range. The method was adopted by all the armies for all calibres of land guns. Furthermore, anti-aircraft guns were designed to permit of all angles of elevation up to 90 degrees. Thus for the first time it became necessary to have a knowledge of all the elements along the trajectory and not merely of the range, time of flight, etc., of the horizontal trajectory. Soon after the war started, improvements in projectiles, which had been developing slowly since 1800, began to make themselves felt in still further increasing ranges.

Causes which led to New Methods.—Siacchi’s method involves an assumption (see 3.274, Equation 58), which introduces an error, if an attempt is made to complete the whole trajectory in a single arc, when the angle of departure is more than 20 degrees. The method of “successive arcs,” based on Siacci (see 3.275), has been used extensively and has the required accuracy, providing the arcs taken are short, but the method is laborious and has other disadvantages arising from the discontinuity of the successive arcs. To overcome these difficulties and at the same time simplify calculations on trajectories, England and France and later the United States adopted the method of numerical integration of the differential equations of motion of the projectile as the standard method of solution. In all these countries the best mathematical talent was brought to bear on the solution of this problem, which in peace-time had received the attention only of a limited number of officers and others connected with the military and naval services and of a few civilians.

The outline of the method of numerical integration given below is that first proposed by F. R. Moulton in the United States, and developed to a high degree by the mathematicians and others associated with him in the study of ballistic problems during the World War. Other methods worked out in England and France, while possessing the same advantages over the older methods, are perhaps not so simple in their application.

Preliminary Assumptions.—For purposes of small arc computations, the retardation of the projectile with normal air density at the gun is represented by

\[ R = \varepsilon G(y) H \]

where \( R \) is the retardation of the projectile, 
\( v \), the velocity in metres of the projectile in the direction of its motion,

\( G(y) \), a function of \( y \), experimentally determined; the retardation due to air resistance of a projectile of ballistic coefficient = 1, moving horizontally at the height of the muzzle of the gun in air at a temperature of 15° C. and a pressure of 760 mm., 78% saturated with water.

\( H(y) \), a function of the altitude \( y \) (above the muzzle of the gun); the ratio between the density of the air at that altitude and its density at a zero altitude.

\( C \), the ballistic coefficient.

Law of Air Resistance.—The results obtained from any mathematical analysis of the motion of a projectile depend for their accuracy upon the care with which the law of air resistance has been experimentally determined. (For a description of the method and calculations by which Bashforth’s ballistic tables, including the law of air resistance, were determined, see 3.271, 272.) In later experiments the same essential methods were followed with the use of more accurate instruments and with projectiles more nearly of the modern form. Such are the Krupp experiments (see 3.273), and the Gavre Commission experiments made in 1888. Chief Engineer Garnier has smoothed out the irregularities in the results of the Gavre Commission firings and has thus obtained a law of air resistance which, while not differing essentially in any region from the results of experiments, is of a continuous character. This cannot be said of Zabudski’s law based upon various powers of the velocity.

The \( G \) Function.—The retardation of the standard projectile due to standard air resistance is put in the form \( \varepsilon G(y) \) for convenience in numerical integration. The function \( G(y) \) here represents the ratio between the retardation and the velocity at each instant. \( G(y) \) as smoothed out by Chief Engineer Garnier is tabulated with \( \frac{v}{100} \) as an argument, velocities and retardations being expressed in his tabulated form in metres.

On the next page (p. 388), Table I, gives an abridged table of the \( G \) Function (\( G \) is the retardation divided by the velocity, for \( C = 1 \) and at surface air density), based on the French tables, giving \( 10 \log G \) with the argument \( \frac{v}{100} \); \( v \) expressed in metres per second.

The \( B \) Function.—The retardation function is sometimes written \( B(v) \), and then \( B(y) \) is the ratio between the retardation and the square of the velocity. In those regions and under those conditions where the "square law" of resistance holds true, \( B(y) \) is a constant.

Figure 1 shows Mayevski’s and Zabudski’s values for \( B(y) \) or \( \frac{G(y)}{y} \) as compared with Garnier’s smoothed-out Gavre Commission values. The tremendous change in the law in the neighbourhood of the velocity of sound is to be noted. More recent but uncompleted experiments indicate that the disturbance in the vicinity of the velocity of sound may be changed in amount and displaced in position by changes in the form of the projectile.

Density Function.—The air density function \( H(y) \) is intended to represent the normal change in density of the air with height. The value of the density function here assumed is,

\[ H(y) = 10^{-y} \]

where \( y \) is in metres. The coefficient of \( y \) is subject to seasonal variations. (See Cours de Ballistique—G. Sugot, 1918.)

The density function merely expresses the law of change of density with altitude. It is quite possible to calculate trajectories in air that do not follow this or any other continuous law, providing we know the density at each height. It is necessary, however, in the calculation of ballistic tables to follow some definite law in order to make the tables consistent throughout. Seasonal variations and other variations from the assumed law are taken care of in differential corrections as will be explained below.

The Ballistic Coefficient.—The ballistic coefficient is represented by the formula,

\[ \frac{w}{d} \]

where \( w \) is the weight of the projectile in pounds, 
\( d \), the diameter of the projectile in inches, 
\( i \), a factor called the coefficient of form which accounts for differ-

</table>

$\chi^2$, the horizontal component of the velocity at that point, $\chi^2$, the horizontal component of the acceleration, $\chi$, the ordinate corresponding to $x$, positive up, $\gamma^2$, the vertical component of the velocity at that point, $\gamma^2$, the vertical component of the acceleration, $\theta$, the angle that the tangent to the trajectory makes with the horizontal.

Since $v$ is the velocity of the projectile in the direction of its motion, and $y = \frac{v}{r}$ and if we assume

$$E = \frac{R}{v}$$

we may write (4) and (5) as follows:

$$\frac{dx}{dt} = -R \cos \theta \cdot \chi^2$$

$$\frac{dy}{dt} = -R \sin \theta - g = \gamma^2$$

where, (see fig. 2), $x$ is the abscissa of any point of the trajectory, positive to the right, $y$, the horizontal component of the projectile in the direction of its motion, and $r$ is the distance of the projectile from the point of departure.

In this form the equations are used in the construction of trajectories by the method of numerical integration.

By reference to (1) we see that

$$E = \frac{G(c)}{C}$$

In this equation, $G$ is a function of the velocity alone, as given in Table I. $H$ is a function of the altitude alone as given in equation (6). $C$ is a function of the weight and form of the projectile as given in equation (5). As in the older ballistic methods, $C$ explicitly includes unknown variations from standard conditions in such quantities as density of the air, moisture in the air, temperature of the air, yaw of the projectile, i.e. angle between the longer axis of the projectile and the tangent to the trajectory.
However, for the purpose of the construction of ballistic tables, as distinguished from range tables, atmospheric conditions are assumed normal and trajectories are constructed with known values of C. In the construction of range tables by the use of ballistic tables or by direct calculation, changes in air density at the gun are accounted for by a factor $\Delta$ representing the density placed in the denominator of the expression for C. equation (5), and changes in form of head, yaw, etc., by the factor $\delta$ in that expression. Here the term "yaw" means the divergence of the axis of the projectile from the tangent to the trajectory, both on account of initial instability and of curvature of the trajectory away from the direction of the axis at a later period.

**Example of Numerical Integration.**—To illustrate the manner in which equations (6) and (10) may be integrated numerically, we shall assume an example as follows:

**Example 1.**—A 155 mm. gun fires a projectile having a ballistic coefficient of 3.6, with an initial velocity of 2,400 ft. per second, at an angle of elevation of 30 degrees. To determine the elements of the trajectory, assuming normal atmospheric conditions:

The values of G and H are given in metres-per-second velocity and metres height respectively, so that all velocities and distances must be reduced to metres.

**Initial Conditions.**—At the gun we have

$v = 2,400$ ft. per second $= 731.5$ metres per second

$\theta = 30^\circ$

$y' = 371.5$ cos $30^\circ = 633.5$

$y'' = 371.5$ sin $30^\circ = 365.8$

and

$y = 0$.

Since $\Delta = 5351$, the value of log $G(\theta)$ from the G table is $9.4515$.

Since $y = 0$, $H(y) = 1$.

Placing logarithms in brackets, we then have

$E = (9.4515 - 10) \times 365.8 = 49.78 = -x''$

$E' = (9.4515 - 10) \times 365.8 = 287.4$

and

$E' + x = 287.4 + 9.81 = 38.55 = -y'$.

At the start, then, the horizontal velocity of the projectile is decreasing at the rate of 38.55 metres per second and the vertical component of the velocity is decreasing at the rate of 49.78 metres per second.

**First Interval—First Approximation.**—If we take a small interval of time, we do not make any great error in assuming that the retardations during the interval can be based upon the velocity and altitude at the beginning of the interval. Taking a $\frac{1}{3}$-second interval, the change in components of velocity is 12.4 and 9.6 metres respectively, making the velocities at the end of the first interval,

$x' = 633.5 - 12.4 = 621.1$

$y' = 365.8 - 9.6 = 356.2$.

These velocities are lower than those that actually exist at the end of the interval, since the retardations are based on the components of the velocity at the beginning of the interval, and are consequently higher than the true average values during the interval. Using the velocity figures just obtained, we find the following values corresponding to the end of the first interval,

$x = \frac{(621.1)^2 + (356.2)^2}{100} = 512.6$

$y = \frac{365.8 + 356.2}{2 \times 10} = 90.2$ metres

$G(\theta) = (9.4464 - 10)$

$H(y) = (9.9959 - 10)$

$E(x) = (9.4464 - 10) \times (9.9959 - 10) \times 621.1 = 47.78$

$E'(x) = \frac{(9.4464 - 10) \times 365.8}{2 \times 10} = 27.39$

Second Approximation. — The values of the components of retardation at the beginning of the interval are based on the velocity at the beginning of the interval and are, therefore, higher than the average values during the interval. The values just obtained for the components of retardation at the end of the interval are based on a velocity and, therefore, have a true one at the end of the interval and are, therefore, lower than the average retardation during the interval. Means between these two sets of retardation components are nearer the average values during the interval than either set. The retardations for the $\frac{1}{3}$-second interval based on the mean values are,

$x' = 621.3$

$y' = 365.3$, and the altitude,

$y = 90.3$.

If we now take these values and recompute $E_x$, $E_y'$ from $74 X^2$ later, we find the values 47.80 and 37.21 respectively. In the average components of retardation during the interval, no essential change will be found, showing that by a second approximation we have reached a result sufficiently accurate.

**Second Interval.**—Beginning with the components of the velocity and the altitude of the projectile at the end of the first interval we may now proceed in like manner to determine the components of the retardation during the second $\frac{1}{3}$-second interval. However, we may shorten the work as we now know not only the values of the retardation components at the beginning of the second interval but also the amounts by which they have changed in the preceding $\frac{1}{3}$-second. If the same rate of change continues during the second interval we will have for the end of that interval,

$E_x = 47.78 - (47.78 - 47.80) = 47.82 = x''$

$E_y' = 37.21 - (38.55 - 37.21) = 35.87 = y''$

The corresponding velocities obtained by using the average retardations during the interval as before are:

$E_x = 47.84$

$E_y' = 35.98$.

Velocities and altitude computed from these do not differ from the values obtained in the first approximation, showing that a second approximation is unnecessary in this case.

**Conclusion of the Process.**—Using exactly the same methods, it is possible to determine numerically, step by step, the values of $x$, $y$, $x'$, $y'$, $x''$, and $y''$. We might also adjust $x$ at each step, but it is not needed in making the step-by-step calculations and is usually more conveniently determined by a summation of $x'$ after all the other values have been determined.

**Length of Interval.**—In the above example it was assumed that the change in $x$, $y$, $x'$ or $y'$ could be found by using the mean of the values of $x'$, $y'$, $x''$ or $y''$ at the beginning and end of the interval. To do this without making too large an error we must use a small interval or take account of second differences. The choice of length of interval will depend upon the ballistic coefficient, muzzle velocity and curvature of the trajectory at the point considered. If these, in combination, or separately, are such as to cause rapid changes in the components of the velocity or acceleration, a relatively short short interval should be taken, as $\frac{1}{3}$-second in the examples above. Otherwise, the interval may be increased to $\frac{1}{2}$-second or longer, and when second differences are used, as will be explained below, to two or more seconds.

High velocities or low ballistic coefficients usually require smaller intervals than low velocities or high ballistic coefficients. It will in general be desirable to take a shorter interval at the very beginning of the trajectory than at a later period. In changing to longer intervals if it is most convenient, in the computations, to take twice the interval just used. As the velocities increase in the descending branch of the trajectory it may be desirable in some cases to use shorter intervals again. If so, half the length of interval just used should be assumed.

**Second Differences.**—The length of interval may be increased and the amount of computation materially reduced if second differences are taken into account in computing all of the functions of $l$, as $y$, $x'$, $y'$ and $y''$.

The following table shows the results of further computations on the examples discussed above and gives first and second differences of $y'$ for intervals of one second.

<table>

</tbody>
</table>

In determining the value of $\Delta y'$ from the average vertical velocity for the interval between $i=2$ and $i=3$, we obtain, if we neglect second differences,

$$\Delta y' = \sum_{i=2}^{3} l' \Delta y' = (666+4\times282) \times 1 = 284.$$
It is evident that the area of the figure between any two ordinates is greater than if the known \( y' \) points were connected by a smooth continuous curve.

\[
\Delta y = \frac{(269+9+28+2x+1.5+3.5+1.12)x}{2} = 283.7
\]
or more generally, since the same process is used in successively evaluating the other functions, etc., we may write,

\[
\int_{a}^{b} \left( \sum_{n=1}^{n} \Delta y_{n} \right) dt = \frac{1}{2} \left( a_{n} + b_{n} \right) \Delta t
\]

where \( f(t) = z_{n}, f(t_{n}) = z_{n-1}, \) etc., 
\( n \) represents the order of the interval, or of the tabulated values of \( z, a, \) and \( b. \)
\( h, \) the uniform length of the interval 
\( \Delta x, \) first differences of \( z, \) 
\( \Delta y, \) second differences of \( z, \) 
The quantities may be arranged in tabulated form as follows:

\[
\begin{array}{cccc}
\hline
n & a_{n} & z_{n} & b_{n} \\
\hline
1 & & & \\
2 & & & \\
3 & & & \\
4 & & & \\
5 & & & \\
\hline
\end{array}
\]

The application of the formula will give the successive increments to be applied in evaluating \( \int z \, dt. \)

The use of second differences in this manner permits the use of longer intervals except at the beginning when no second differences are available. In this case a shorter interval is used and a sufficient number of results are tabulated or a second difference is estimated by approximate methods.

The integral having been obtained by the methods described, up to any interval, Simpson’s rule or other similar method may be used to check the values obtained.

**Complete Solution of a Trajectory.**—The results of the complete solution of the following example are given in Table II. below.

**Example II.**—A 75 mm. gun is fired at an angle of departure of \( 45° \), a projectile of 15 lb. weight with a form factor, \( t = 0.6. \)

The muzzle velocity is 2,175 ft. per second. Determine the coordinates of the trajectory and the horizontal and vertical components of the velocity and acceleration.

**Ballistics.**—Using the method of numerical integration described, we may construct a series of trajectories with the values of the muzzle velocity, ballistic coefficient and angle of elevation so chosen and spaced as to cover the field of guns and ammunition in actual use. By proper arrangement of the principal elements of the trajectories thus determined, it is possible to form tables in convenient form for use, from which by interpolation we may obtain the important elements of the trajectories corresponding to any given gun. Such tables have been constructed in France and America.

The American tables, constructed under the supervision of A. A. Bennett, consist of two main tables. The first table is a direct tabulation of the results of numerical integration of trajectories. For this purpose it has been found most convenient and economical of labour to assume a ballistic coefficient and velocity at the summit and construct the trajectory forward and backward from that point. The arguments in this table are the ballistic coefficient, the velocity at the summit and the ordinate from the summit. The table gives the corresponding values of \( x, x', y' \) and \( l \) from summit forward and backward.

The second table is arranged with \( C, \phi \) and \( V \) as arguments and gives the \( x, y \) and velocity at the summit.
This set of equations like (9) and (10) may be integrated by the method of numerical integration, but we must first obtain an explicit relation between $\Delta E$ and $x''$ and $y'$. 

Effect of the Variations on $E$.—Since by equation (11) $E = \frac{GH}{C}$ we may write approximately:

$$\Delta E = \frac{d G}{d E} \Delta G = \frac{d \log G}{d E} \Delta E$$

and

$$\Delta H = \frac{d H}{d y} \Delta y = \frac{d \log H}{d y} \Delta y$$

we may write the equation,

$$\Delta E = \frac{d G}{d E} \Delta G + \frac{d H}{d y} \Delta y$$

Now,

$$\Delta a = x''^2 + y''^2 = \frac{\Delta(x^2 + y^2)}{2x^2 + y^2} = 2x'x'' + 2y'y''$$

and $\Delta y = y$. Consequently we may write,

$$\Delta E = \frac{d G}{d E} \Delta G + \frac{d H}{d y} \Delta y$$

The first term of the second member of this equation gives the part of $\Delta E$ due to variations in the components of the velocity and of the height. The last term gives the part due to variations in the ballistic coefficient including variations in the air density. Equation (26) is based on the assumed law of retardation as given by Table I. and the assumed law of air density as given in Equation (2).

If we assume for $H$ the exponential formula given by equation (2)

we have $\frac{d \log H}{d y} = -0.000136$ a constant.

The term $\frac{1}{dG} \frac{dG}{dE}$ or $\frac{1}{dG} \frac{dG}{dE}$ is found from the $G$ function.

Table I. and tabulated with $\frac{1}{100}$ as an argument in Table III. below.

If we assume for $H$ the exponential formula given by equation (2)

we have $\frac{d \log H}{d y} = -0.000136$ a constant.

The term $\frac{1}{dG} \frac{dG}{dE}$ or $\frac{1}{dG} \frac{dG}{dE}$ is found from the $G$ function.

For use in making differential corrections. Argument $\varphi/100$ ($\varphi$ in metres). The expressions $-0.0723$, $-0.0878$, etc. mean $-0.0723$, $-0.0878$, etc.

</table>

The above table is a correction table for the air density and the gun variables:
Integration of the Differential Equations of the Variations.—By using equation (21) with (22) and (26) we make a step-by-step numerical integration for any assumed variation. The system requires a separate integration corresponding to each assumed variation of conditions in each trajectory. It is always assumed that the original trajectory has been constructed and that we know its elements. The integration may proceed forward or backward from any point, as at the muzzle or the end of the trajectory, where we know or may estimate the values of disturbing variations and the effects produced by them.

Bliss's Method.—As may be inferred, the method for computing differential corrections, just described, involves a large amount of work. A method discovered by Professor G. A. Bliss, which can be used in certain cases in which the original difference equations are linear, is employed in the Ballistic for the first time. In using Bliss's method, one numerical integration of the system will suffice for the computation of the corrections for all the variations. The method is, therefore, invaluable when a large number of differential variations are to be worked out.

Tabulated Differential Corrections in Ballistic Tables.—Certain differential corrections have been tabulated, in separate columns of ballistic or range tables as follows:

(a) Rate and deflection corrections for the rotation of the earth as functions of the geographical latitude of the gun, azimuth of the plane of fire, and the three standard parameters of the trajectory, muzzle velocity, angle of departure and ballistic density factor.

(b) Corrections in range for variations in assumed air density throughout layers at convenient altitude intervals.

(c) Correlation of correction for a component of wind in the plane of fire, throughout layers at convenient altitude intervals.

(d) Corrections in deflection for a component of wind at right angles to the plane of fire throughout layers at convenient altitude intervals.

In addition, corrections for variations in initial components of muzzle velocity, and variations in ballistic coefficient, may be obtained by interpolation in the use of the columns of the tables. A correction in air density at the gun may be computed for this in the following manner by determining its effect on the ballistic coefficient and making the corresponding interpolation in the table. This assumes that any change in the gun is the same as that produced by a corresponding change in the air, according to the law given by the H function of the first list of variations referred to, more will be said below.

Effect of Wind.—Any wind acting on the projectile in flight may be resolved into two components; one along and the other perpendicular to the plane of fire. It is convenient to do this in considering the effects of winds, and we thus have range winds and cross winds.

Uniform Range Wind.— Corrections due to rear or head winds may be handled by equations (21) and (22) and (26). In using these equations we must merely remember to increase or decrease the velocity of the ground by the wind velocity when it is acting at right angles to the Tables, I, or II, the corresponding functions. From this, a correction due to wind may be handled in the same manner as a correction due to variations in any of the initial conditions, air density, etc.

Variable Wind.—The direction and velocity of the wind will seldom be uniform throughout the trajectory. The velocity of the wind and also its direction near the surface of the earth is frequently influenced by local causes, such as the presence of hills, trees, houses, etc., to such an extent as to give no indication of the true average values during the flight of the projectile. Under normal conditions the wind may change both in direction and velocity as we go upward. Cases in which there is complete reversal of the wind well within the maximum ordinate of the trajectory are not unusual. The change in direction may also be accompanied by a change in velocity. In the preparation of range tables it is necessary to correct in some way for the effect of this sort of wind. The method usually followed is to divide the air above the earth's surface into zones of height, say 250 metres. By observation, the direction and velocity of the wind in each zone are determined.

For any assumed trajectory let \( \Delta R \) be the range correction of a uniform range wind of 1 metre per second, acting throughout. Let \( T_f \) be the total range effect produced by a wind of 1 metre per second blowing in the first zone and no wind in the other zones. The \( \Delta R \) correction can be computed by numerical integration of equation (21) and (22) to the limits of the zone, using 1 metre per second wind. With the corrections found for that point, the integration is continued in still air until the projectile again enters the first zone. With these last corrections and the wind again acting, the integration is continued, the final correction \( \Delta R_f \) determined.

In the same manner the correction \( \Delta R_n \) for a wind of 1 metre per second, acting in the second zone, and no wind in the other zones, is determined. We then have

\[
\Delta R = \Delta R_1 + \Delta R_2 + \ldots + \Delta R_n
\]

If \( u_n, u_2, u_1, \ldots \) represent the wind velocities in the various zones, and \( \Delta R \) represents the total range effect due to them, we may put approximately

\[
\Delta R = \Delta R_1 + \Delta R_2 + \ldots + \Delta R_n
\]

In this equation some of the winds may be rear and others head, so the terms should be taken with their proper signs.

Weighting Factors and Ballistic Wind.—If we place

\[
R = (f_1 \Delta R_1 + f_2 \Delta R_2 + \ldots + f_n \Delta R_n)
\]

the ratios \( f_1, f_2, \ldots \), etc., are called weighting factors since they show the fractional part of the total wind effect that is produced in each zone. Using these factors we may write

\[
R = (f_1 + f_2 + \ldots + f_n) \Delta R_n
\]

The factor in brackets is the ballistic wind. It is the wind which, if blowing uniformly throughout the trajectory, would produce the same range effect that is produced by the variable winds actually blowing.

In the preceding discussion we have considered only rear or head, that is, range winds. Cross Wind.—In the discussion of the trajectories so far given, no account has been taken of forces which tend to move the projectile from the plane of fire. Aside from drift, the principal cause of deflection from the plane of fire is the existence of a cross wind component, and the effect of this drift is due to the difference of the projectile for a given gun and projectile and is determined once and for all by experiment, that due to cross wind varies with the velocity of the wind as well as with the elevation and azimuth of the gun. If the angle \( \theta \) represents the distance in mile the projectile is blown from the plane of fire at any instant by a cross wind \( w \), distances and winds to the right being taken as positive, we will have \( z' \), the velocity from the plane of fire, and \( z'' \), the acceleration produced by the component of air resistance normal to the plane of fire. The velocity of the projectile with respect to the air will be \( z'' \).

Now it will be sufficiently exact to consider the motion perpendicular to the plane of fire in the same manner in which we considered the horizontal motion in the plane of fire in equation (6), remembering that the velocity with respect to the air is \( z'' \). We may then write,

\[
z'' = -E \times \omega
\]

Combining this equation with the relation \( z'' = -E \times \omega \) from (9) we obtain after reduction and division by \( x^2 \)

\[
z x'' = \frac{z' x' - z x'}{x^2}
\]

Upon integration from 0 to \( t \) this becomes,

\[
z = \frac{z'}{x} \left( 1 - x' \right)
\]

or

\[
z = \omega \left( 1 - x' \right)
\]

Integrating again we obtain,

\[
z = \omega \left( 1 - x \right)
\]

which makes the total deflection at the end of the trajectory,

\[
Z = T = \frac{\omega}{x'} X
\]

In this expression \( T \) is the total motion of the air with respect to the ground in the time of flight \( T \). The deflection of the projectile is less than the motion of the air by the amount \( \frac{\omega}{x'} X \), which is the deflection at the total range \( X \) that would be caused by a change of azimuth by the angle whose tangent is \( \omega \).

Cross wind weighting factors and the ballistic cross wind are determined in the manner described for range winds.

Effect of Curvature of the Earth.—While in the example of the numerical integration of a trajectory, given above, and also in the consideration of ballistic winds, the effect of curvature of the earth is not taken into account, it would be quite possible, still retaining
the system of rectangular coordinates with the x axis horizontal and the y axis vertical at the gun, to take account of the effect of curvature, both as it affects the direction lines of gravity and the height of site. Corrections due to curvature become important only at long ranges and then the most important corrections in the case of site are the curvature of the earth away from the x axis. The correction angle at the gun due to curvature is one-half the angle at the centre of the trajectory.

**Correction for Rotation of the Earth.**—If a projectile is fired due east or west at the equator, it has, at the muzzle of the gun, not only the initial velocity with respect to the earth but also the velocity of the earth at that point in the motion of the earth. For a given speed of translation along, this fact would have no effect on the trajectory; but since the earth rotates around its axis and the rising projectile gets furthest from this axis at the top of its arc, it is produced upon the trajectory. This may be made more plainly evident if we assume the projectile to be fired vertically at the equator. With a massless east or one moving in right lines the projectile would fall straight down. But the earth's rotation, as the projectile has, at the muzzle, the vertical velocity given it by the gun, as well as the horizontal velocity of the earth's surface; as it rises it retains the latter velocity at all heights which it reaches. If we now consider points on the earth with a speed through but above the muzzle of the gun we readily see that they have horizontal velocities due to the rotation of the earth in excess of those of the projectile at corresponding heights. It is evident, therefore, that the projectile will lag behind this free fall and will fall to the earth west of the gun. A similar range correction will exist if the gun is fired east or west at the equator at any angle of elevation. The range correction produced by the angular velocity of the earth and the diameter of the equatorial section and depends besides upon the elements of the particular trajectory.

If the gun is fired along a parallel of latitude we have a somewhat similar situation. For, as has been shown, the velocity of the earth's surface is now less in the proportion cos \(\lambda\), where \(\lambda\) is the latitude. Now if the gun at the equator were fired along a meridian, the somewhat similar situation the velocity free fall would no longer exist as a range correction but would become a deflection correction. For a gun fired at any point of the earth it may be shown mathematically that the corrections due to the obvious above may be represented by functions of the form

\[ A \cos l \sin a \]

\[ D \cos l \cos a \]

where \(l\) is the latitude, \(a\) is the azimuth of the plane of fire measured from the north, and \(A\) and \(D\) are functions whose values depend upon the trajectories.

The above corrections for both range and deflection arise from the lag of the projectile behind the surface of the earth due to its greater distance from the centre of the earth. Another consideration which gives rise to an additional deflection is the change in the velocity of the earth's surface with latitude. A projectile fired from the pole will be deflected at right angles to the plane of motion upon the surface of flight and hence by a lateral amount approximately proportional to the product of the time of flight and the range. For a latitude \(l\) the deflection due to this cause is equal to that at the pole multiplied by \(\sin l\) and may be represented by

\[ B \sin l \]

A rough value of \(B\) is \(0.025\), where \(\theta\) is the angular velocity of the earth. The total displacements due to rotation of the earth are, therefore, given by the following equations:

\[ (37) \quad \Delta X = -A \cos l \sin a \]

\[ (38) \quad \Delta Z = B \sin l \cos l \]

Since \(A\) changes sign at cot \(\theta = \cot \phi\) (in vacuum) or at \(\phi = 60^\circ\), it follows that there is no range correction for rotation at any latitude or azimuth.

However, the resistance of the air markedly affects both range and deflection corrections due to the earth's rotation, and the approximate equations (40) to (42) applicable to trajectories in vacuum are not adequate for these corrections with long trajectories.

**Variations from Standard Air Density.**—In case the observed air density differs significantly from standard air density we may divide the air into zones of height, as for variable wind, and determine air density weighting factors and a ballistic air density. The range correction for a variation in air density of 0.025 is 0.004 per cent, and it is evident that the law of air density given by equation (2) holds throughout the trajectory. The partial corrections due to the same percentage variation in each zone are then worked out. The ratios of these partial corrections to the total correction are the weighting factors. When the weighting factors are multiplied by the observed densities in corresponding zones, corrected to their value at the ground following the normal law, and the sum of the products for all the zones is taken, we have the ballistic air density.

**Effects of Temperature Variations.**—The temperature of the earth affects both its density and its elasticity. In so far as it affects the density of the air, it manifests itself as a change in atmospheric pressure; any changes due to wind are accounted for by the density correction, and when once the density is known no further reference need be made to temperature. In the case of the effect of temperature on the rate of sound, the temperature, the elastic density of the air, and almost independent of its effect on density. Elasticity of the air may be measured by the velocity of sound therein. This is known to increase as the square root of the absolute temperature as is true for density, and this is why the temperature, the B curve will be similarly displaced and hence the F function used in equations (9) and (10) will be changed. With the quadratic resistance law, the B curve would be a right line parallel to the temperature axis, and no change would be caused in B, G or E by a change of temperature.

Trajectories used for ballistic table data are worked out for normal temperature:

\[ 15^\circ C = 59^\circ F = 88^\circ A, \text{ and are so tabulated.} \]

**Standard Temperature.**—It would be more logical if trajectories were worked out under some lower law of temperature gradient, similar to that assumed for the density gradient, equation (2). Taking account of the "gas law" derived from Boyle's and Charles' laws, the law given by equation (2) (2) may be modified to give the equilibrium which requires the difference in pressure at altitude \(v\) and sea level to be due only to the weight of the intervening layer.

A. E. Beckett has arrived at the following formula for temperature aloft:

\[ T = 50 - 35 \times 10^{-6} v (\text{ where } T \text{ is the temperature in } ^\circ F). \]

This presents fairly mean midsummer temperatures in the United States. For mean midwinter temperatures subtract 12.5 \(^\circ C\) or 22.5 \(^\circ F\) throughout. Corrections may be worked out to enable one to pass from the tabular data, based on constant temperature, to data based upon "temperature" in 100 miles by multiplying the tabular values or the projected spherical, as formerly, there could be but one presentation or one section exposed to air pressure, though the projectile might rotate in any direction.

Modern projectiles are given a motion of rotation by the rifling to prevent them from tumbling end over end and thus meeting with vastly increased and irregular air resistance. A projectile so designed as to place the "centre" of pressure on the central axis, would doubtless travel head-on without having rotation. Attempts have been made to design such projectiles with some success as far as the ability to travel head-on is concerned; but it has always been impossible to increase the "centre" of pressure or resistance of an elongation projectile with a tail or a similar device, to an extent as to make them inferior to projectiles stabilized by rotation. Projectiles of this type are now used as bombs to be dropped from aircraft but are not fired from}

**Yaws of the Projectile.**—It has been determined by experiments that elongated projectiles do not always make round holes through the target if their centres call at the back of it, due to the rotation of the projectile in front of the gun. By placing a sufficient number of these cards, it is found that the holes change in regular cycles, from greater to less and again to greater elongation. For a given round, certain positions of the gun cards, if thickly spaced, give holes of the greatest elongation, corresponding to the maximum yaws of the projectile, and certain other positions give holes of least elongation corresponding to the minimum yaws. If a gun card is placed so that the card yaws 200 or even 300 to 400 to the right will be found that the maximum yaws will diminish in value, the first one that appears in front of the gun being the greatest. By yaw is understood the angle between the direction of motion of the centre of gravity and the axis of the projectile.

In the **Aerodynamics of a Spinning Shell** by R. H. Fowler, E. G. Gallop, C. N. H. Lock and H. W. Richmond, F.R.S. (Phil. Trans., vol. 221), a very elaborate series of British jump-card experiments conducted by them. While the existence of initial instability of projectiles had long been known, knowledge of its laws and the development of a new kind of accuracy were neglected in these British experiments made in 1918.

**Causes of Yaw.**—A projectile hitting perfectly in the gun and having the centre of gravity of every cross section on the axis of the barrel, in spite of the three dimensional forms of the projectile, unless some force start an angular motion of the longer axis. For the short distance with which we are here concerned the effect of gravity in curving the trajectory away from the axis is neglected. A yaw always be very small and would not be noticed if it had a yaw not coincident with its motion, yaw would slantly in the gun. On leaving the muzzle it may receive an additional yaw from the powder.
pressure against the base when the front bearing is unsupported, from the jump of the gun and from the powder blast.

Furthermore, at this point the air resistance begins to act in retarding the projectile. The action line of the resultant air pressure on a yawing projectile intersects the axis at a point in front of the centre of gravity. The resultant air resistance, therefore, exerts a moment around an axis through the centre of gravity, in such a direction as to increase the yaw. We then have a motion similar to that of a spinning top or gyroscope when an angular motion is given to the axis of spin, except that we have in addition a rapid motion of the centre of gravity.

In other words, the projectile has a motion of translation accompanied by precession and nutation. The motion of the point projected on a plane through the centre of gravity and normal to the trajectory, describes a rosette, as shown in fig. 5.

Condition of Stability.—If the spin is insufficient the air moment may cause the projectile to tumble. The condition of stability may be expressed by the following equation:

$$ s = \frac{A^2 N^2}{4H \mu} $$

where

$\delta$, the stability factor. Its value must be greater than 1.0 if the projectile is not to tumble, and not lower than 1.5 or 2.0 for modern projectiles, if excessive yaws are to be avoided.

A, moment of inertia of the projectile about the axis of spin,

B, moment of inertia about an axis at right angles through the centre of gravity,

N, the velocity of rotation about the longer axis in radians per second,

$U$, sin $\delta$, the moment of the air resistance in a plane through the centre of gravity at right angles to the longer axis when the yaw is $\theta$.

The value of $\delta$ depends upon the air resistance, but is nearly independent of $\delta$ for small yaws.

$\delta$, the angle of yaw.

By an analysis of the results obtained in British and American jump-card experiments, R. H. Kent has determined that the value of the first maximum yaw outside the gun may be computed in terms of the stability factor and the yaw inside the gun by the following equation:

$$ a_1 = \frac{21}{A} \frac{s}{\mu} - \frac{1}{2} $$

where $a_1$ is the first maximum yaw.

$\mu$, the yaw in the gun.

Figure 6 shows the values of $a_1$ in terms of $s$ for a value of $\frac{1}{A} = 8$ and $\frac{A^2 N^2}{4H \mu} = 0.2$.

It appears from this relation that the maximum yaw in front of the gun is principally due to the yaw in the gun, and that it is very little affected by the pressure of the powder gas, during the time the projectile is emerging from the muzzle, by the jump of the gun, or by the blast in front of the muzzle.

Orientation of the Yaw.—The plane of yaw contains the path of the centre of gravity and the axis of the projectile. The orientation of the yaw is the angle between this plane and the vertical plane containing the path of the centre of gravity. It is determined by measuring the angle between the traces of these two planes on the jump card. The precessional motion consists of rotation of the plane of yaw around the centre of gravity, while the motion in nutation consists of oscillations around an axis through the centre of gravity normal to the plane of yaw.

For a small yaw not accompanied by nutations the rate of change of orientation is,

$$ a' = \frac{AN}{2 \gamma} $$

The motion in nutation causes abrupt changes in this rate in the neighbourhood of the minimum yaws.

Damping of the Yaw.—Reduction in the yaw of the projectile, as it proceeds down the range, is principally due to the following factors: (a) The component of the air resistance normal to the direction of motion of the yawing projectile causes motion of the centre of gravity in the direction of the yaw. The effect is a virtual reduction in the yaw accompanied by a helical motion of the centre of gravity; (b) the resultant angular motion of the axis of the projectile due to precession and nutation sets up an air-resistance couple which opposes that motion, and which is quite distinct from the air-resistance moment which causes the main part of the initial maximum yaw. The effect of the couple is first to damp out the nutations and finally to reduce the yaw; (c) as the velocity of the projectile decreases, the air resistance also decreases. The consequent reduction in the air-resistance moment on a yawing projectile causes a reduction in the maximum yaws.

Effect of Yaw on Range and Accuracy.—The resistance of a yawing projectile is very much greater than that of a projectile moving in the direction of its axis. Experiments made by G. F. Hull and L. J. Briggs in an air stream indicate that at a velocity of 200-300 metres per second, the head-on resistance of a projectile of modern form of yawing 15° is two to two and one-half times that of the same projectile moving in the direction of its axis. A considerable yaw in front of the gun will, therefore, cause a rapid reduction in the velocity and a reduction in range.

It is readily seen that a variation in initial yaw between rounds will cause bad range dispersion. The same is true of dispersion in deflection. It may be stated that irregularity in initial yaw, whatever may be its cause, forms one of the principal factors in dispersion of fire.

Drift.—As the projectile proceeds along the trajectory, its axis tends to remain parallel to its original direction at the gun. Since the effect of gravity causes the trajectory to curve toward the earth, there is a gradual increase in the angle between the axis of the projectile and the trajectory. This yaw, due to gravity, is quite distinct from the initial yaw described above and does not proceed to have an important effect on the flight of the projectile until after the greater part of the initial yaw has been damped out.

A yaw having been developed by gravity, the air-resistance moment $\sin \theta$, tending to rotate the spinning projectile in the plane of yaw, causes motion in a plane at right angles. The effect with right hand rotation of the projectile, is to cause the point of the projectile to move at first to the right of the plane of fire and at a later period downward the projectile being bodily displaced by the component of air resistance acting normal to the direction of motion, on the side presented by the yaw. The initial instability and the drift phenomena of like nature. While the initial instability is caused by a suddenly applied yaw, or a high rate of change of yaw, and is accompanied by a rapid motion in precession and nutation, the drift is caused by the gradual yaw due to the action of gravity on the projectile, and is accompanied by a very much slower motion in precession without nutation.

BALLOON: see AERONAUTICS.

BALTIMORE (see 3:288).—The pop. of Baltimore, the 8th city of the United States in number of inhabitants, increased in the decade 1910-20 from 358,485 to 733,826, of which number 105,350 in 1920 were negroes as compared with 84,799 in 1910. The 31.4% increase in the total population represented in part a normal growth or one caused by the establishment of new industries, and in part an annexation (Act of Legislature of 1918) of 63,131 acres of Lake Township, which had one central building, 12 branches and two stations, reported in 1920 the erection of six additional branches, and that plans had been accepted for the erection of four more branch buildings.

Education.—Notable progress was made by Johns Hopkins University in the decade 1910-20. The library public system of the city was under the direction of Dr. Archibald T. MacLeish. The church property value in 1919 was $16,167,350. The total church membership was 100,000. Among the organizations notable in the Roman Catholic Church led with 137,730 members (100,397 in 1906), and following it in the order named came the Methodist Episcopal Church, 30,217 (24,605 in 1906), the Baptist Church (National Convention, Coloured) 24,648 (16,881 in 1906), and the Protestant Episcopal Church 17,200 (16,812 in 1906). In 1915 all the charitable agencies formed an administrative association, the Baltimore Alliance of Charitable and Social Agencies, which coördinated the work of the individual organizations.

History.—The mayor of Baltimore from 1907 to 1911 was J. Barry Mahool, Democrat. From 1911 to 1916 the mayor, James H. Preston, and the City Council were Democratic. A Republican mayor, William F. Browning, was elected in 1918, but the City Council continued to be Democratic. In the World War the Baltimore militia organizations, the 4th and 5th Maryland Regts., were combined with the 1st Maryland to form the 191st Inf. U.S.A.; the M. F. Engineers became the 31st and 22d of the 11th F.A., U.S.A. Several small regiments followed these into the 20th Division and were trained at Camp McClellan, Ala. The infantry units of this division saw service at the front in France. Sixteen thousand five hundred men were raised by selective draft. Many of these received their training at Camp Meade, Md., and saw service at the front with the 79th Division, as the 313th Infantry Regiment.

Preston, Mayor, 1918; Statistics of Baltimore Board of Trade, 1920.

BANBURY, SIR FREDERICK GEORGE, 1st Bart. (1820-1901). British politician, was born in London Dec. 2, 1850. He was educated at Winchester, and afterwards adopted a City career. He entered the Stock Exchange, and subsequently figured in various capacities as a director of companies. He successfully contested Peckham as a Conservative in 1892, and established his reputation in the House of Commons as a constant critic on business matters and also as an expert in parliamentary procedure. In 1902 he was created a baronet. He lost his seat in the general election of 1906, but was elected a few months later as one of the members for the City of London (relected 1918). In 1916 he was created a privy councillor, and in 1917 became chairman of the Great Northern railway.

BANBURY, HUBERT HOWE (1832-1918), American historian (see 3:500), died at Walnut Creek, Cal., March 2, 1918. He published in 1900-10 The Book of Wealth and in 1912 Retro- spective, Personal and Political, the latter giving an account of his labours.

BANCOLD, SIR SQUIRE (1841- ), English actor and manager (see 3:500), made his last regular appearance on the stage as Count Orlor in a revival of Diplomacy at the Garrick in 1893. The part was created for him by Queen Victoria at Balmoral Castle in Oct., 1892. He subsequently only appeared occasionally at special performances, the latest and most notable of which was at His Majesty's theatre, London, in Dec., 1918 when he played Trip- let in Masks and Faces.

His wife, LADY BANCOLD (1839-1921), died at Folkestone, May 22, 1921. She had first appeared on the stage under her maiden name of Marie Eifle Wilton at Manchester as Fleance in Macbeth and as Prince Arthur in King John as

Supply Loan $15,000,000; the Port Development Loan $10,000,000; the Municipal Hospital Loan $750,000.

Several of the city banks and trust companies, exclusive of private banking firms, showed Jan. 1 1920 aggregate resources of $522,783,000 and deposits of $141,453,000. In 1919 Baltimore was the 11th city in the country in bank clearings with a total of $4,153,146,572, a gain of 29.4% over the preceding year and of 91.6% over 1917.

Religion, Charity, Hospitals.—In 1916 there were 94 religious organizations in Baltimore owning 255 places of worship, and church property value at $16,167,350. The total church membership was 100,000. Among the organizations notable in the Roman Catholic Church led with 137,730 members (100,397 in 1906), and following it in the order named came the Methodist Episcopal Church, 30,217 (24,605 in 1906), the Baptist Church (National Convention, Coloured) 24,648 (16,881 in 1906), and the Protestant Episcopal Church 17,200 (16,812 in 1906). In 1915 all the charitable agencies formed an administrative association, the Baltimore Alliance of Charitable and Social Agencies, which coördinated the work of the individual organizations.

BANCROFT, HUBERT HOWE (1832-1918), American historian (see 3:500), died at Walnut Creek, Cal., March 2, 1918. He published in 1900-10 The Book of Wealth and in 1912 Retrospective, Personal and Political, the latter giving an account of his labours.

BANCOLD, SIR SQUIRE (1841- ), English actor and manager (see 3:500), made his last regular appearance on the stage as Count Orlor in a revival of Diplomacy at the Garrick in 1893. The part was created for him by Queen Victoria at Balmoral Castle in Oct., 1892. He subsequently only appeared occasionally at special performances, the latest and most notable of which was at His Majesty's theatre, London, in Dec., 1918 when he played Trip-let in Masks and Faces.

His wife, LADY BANCOLD (1839-1921), died at Folkestone, May 22, 1921. She had first appeared on the stage under her maiden name of Marie Eifle Wilton at Manchester as Fleance in Macbeth and as Prince Arthur in King John as

Supply Loan $15,000,000; the Port Development Loan $10,000,000; the Municipal Hospital Loan $750,000.
early as 1847. She made her début in London in 1856 with Charles Dillon at the Lyceum theatre as Henri in Belphégor. Her brilliant career as an actress, from the time when in 1856 she went into management at the Prince of Wales's theatre, and married Mr. (afterwards Sir Squire) Bancroft in 1868, came to a close in 1885, when she and her husband retired from the stage; but Lady Bancroft reappeared with him in the Diplomacy revival of 1893, and twice subsequently made a single appearance at a special matinee, the last occasion being the benefit performance for Miss Nellie Farren in March 1898.

BANDELIER, ADOLPH FRANCIS ALPHONSE (1850-1914), American archaeologist (see 3.317), died at Madrid March 19 1914. His last published works were The Islands of Tilitaca and Koati (1910) and The Ruins of Tiluanaaco in Bolivia (1912).

BANERJEE, SIR SURENDRANATH (1828-1917), Indian orator, political reformer and journalist, was born Nov. 10 1828, a member of the Rarhi sub-caste of Kulim Brahmans, and the second son of a medical practitioner in Calcutta. Passing for the Indian civil service at the open competition of 1870, he was posted to Sylhet as assistant magistrate but, at the expiry of two years, was compulsorily retired on a small compassionate pension, on account of a technical irregularity—a decision since admitted generally to have been unduly harsh. He then opened a small school in Calcutta which soon expanded into a well-known Rarhi College. His work as a political reformer began in 1876 when he founded the Calcutta Indian Association, and three years later he became editor of the Bengal Times newspaper. In subsequent years he became the centre of many stormy episodes. He was one of those who established the Indian National Congress in 1883, and presided over the Poona session of 1895 and again at the meeting at Ahmedabad in 1902.

From 1876 to 1899 he served on the Calcutta corporation, when he resigned with 27 other leading commissioners as a protest against the changes introduced by the Calcutta Municipal Act. In 1893 he was elected to represent the corporation on the Bengal Legislative Council, and was twice returned to the central Legislature as member for Bengal. He gave evidence in 1897 before the Royal Commission on Indian Expenditure and frequently visited England in connexion with deputations and political missions. Vehemently opposing the administrative partition of Bengal effected by Lord Curzon in 1905, he supported the boycott of foreign goods and the movement in favour of "national" education which arose from the upheaval. He always exhibited, however, a preference for constitutional agitation and was among the first to welcome the Chelmsford reforms. Succeeding his association with the Congress, which had passed under "extremist" control, he formed an "Indian Liberal" organization, and came to London in 1910 to present the case for his party before the Joint Parliamentary Committee, subsequently accepting office as Minister for Local Government and Sanitation in Bengal. A knighthood was conferred upon him in Jan. 1921. Possessed of a remarkable knowledge of the English language and literature, he had earned by his eloquence the title of the Gladsdale of India.

(H. E. A. C.)

BÁNFY, DEZSŐ [DESSÉRTUS], BARON (1843-1911), Hungarian statesman (see 3.315). In 1906 Bánfy, who had joined the coalition in opposition to the Government, broke with it on the military questions at issue with the King-Emperor, which he wished to eliminate, and in 1908 he became leader of the progressive element and, as president of the Franchise League, began an agitation for universal, secret and equal suffrage (see 13.920, 921). In 1910 he became president of the Reform Club. He died May 24 1911.

BANG, HERMANN JOACHIM (1858-1912), Danish author (see 3.315), died Jan. 20 1912. In 1910 a volume of essays appeared, Mæster og Mennesker, followed in 1911 by a volume of short stories, Eu delig Dag. His collected works were published in six volumes in Copenhagen and Christiania (1912).

See F. Poppenberg, Nordiske Portræts—Hermann Bang (1912).
a position of great importance by absorbing smaller banks, and when the Bank of England was absorbed by the London and Midland Bank in 1918, Fowler joined the National Bank of London and its latter. The title of the bank was finally fixed as the London County Westminster & Parr's Bk, Ltd. As the bank now stands it represents six Union Banks: London County & Westminster Bank; Jones, Lloyd & Co.; London & County Bank; Alliance Bank (subsequently changed to Parr's Bank); Fowler, Banbury & Co., and the Consolidated Bank. In Ireland the London County & Westminster Bank has affiliated with the Ulster Bank, Ltd., and it also has foreign auxiliaries in France, Belgium, and Spain. The total number of banks and affiliations represented in 1919 was sixty.

The rise of the London Joint City & Midland Bank, Ltd., is more recent. It sprang from the Birmingham and Midland Bank, and although it absorbed a number of smaller banks from 1918 onwards, its first great step forward may be said to date from 1917, when it absorbed the Central Bank of London, Ltd., and adopted the new title of the London & Midland Bank, Ltd. Then in 1919, it absorbed the old City Bank and again altered its name to the London City & Midland Bank, Ltd. Other amalgamations soon followed, and the principal absorptions were those of banks of such provincial fame as the Sheffield Banking Co., the North & South Wales Bank, and the Bradford Banking Co. Further additions were made of some new stock of banks and of the title of banking concerns. Including its affiliated institutions and foreign auxiliaries it represents a total banking strength of what were formerly 119 separate banks. Among some of the more important institutions which have absorbed the titles of other banks are: the Shropshire Banking Co., the Coventry & Warwickshire Banking Co., the Birmingham Joint Stock Bank, the West City & Country Banking Co., Bristol & West of England Bank, and the Wolverhampton & Westenum. The great amalgamation came, however, when the Capital & Counties Bank, Ltd., was absorbed. The Capital & Counties Bank, as it happens, was itself established in 1834 and some six years later commenced to absorb other banks. In fact from 1877 to 1897 it acquired the business of no fewer than 26 other banks. Its career as a separate institution came to an end in the early part of 1918, when it was amalgamated with Lloyd's Bank, Ltd., the Midland Bank, Ltd., the London Midland & Scottish Bank, and the London and North Western.

The great upward movement in the amount of deposits held by the banks may be said to date from 1910; consequently, it will be of interest to place on record the deposits of the large banks in that year, and those at the end of 1921.

Concerning the reasons for amalgamation, little need be said. The war undoubtedly did the leading London bankers to look for increased financial resources, in order to cope with the increased magnitude of the operations they were being called upon to finance. Fashion, the desire to out-bid other institutions, the element of self-preservation, banking evolution, the conven-
BANKING

That there is no foundation for the accusation, sometimes heard, that the country had suffered from the closing of branch banks, is apparent from the fact that in 1890, when the fever for amalgamation had not taken so large a hold on the bankers, there were 104 banks in England and Wales with 2,203 branches; by the end of 1920, with only 20 banks functioning, the number of branches had grown to 7,257.

In Scotland and Ireland, where the banks have preferred to strengthen their position and preserve the fusion of other large institutions, probably the most naïve reason advanced in justification for amalgamation was that of the chairman of one of the great banks, who said that "combination must come." This was a new variant of the old peliti principii, "it is coming because it must come and it must come because it has come."

The remark, no doubt, truly reflected a sense of the inevitability of a further stage of evolution. Even so, to the most casual observer it would seem as if the voracious appetite of the supermen in banking had at last been satisfied, for so great had been the absorptions that any further extension of the process, or any activity of the "banking" sort of necessity had mainly to be the acquisition of the relatively unimportant private or merchant banks. In a word, amalgamation had spent itself by 1920, since any further fusion of the larger institutions would probably be regarded with suspicion by the general public.

As showing how the old private institutions have gone out of existence it may be said that out of 38 private banks which were doing business in 1891, there remained only four in 1921. The latest absorption up to the middle of 1921 was the acquisition in Feb. of that year of the business of Messrs. Fox, Fowler & Co., Somerset, by Lloyd's Bank. It was interesting as marking the passing of the last conventional bank in England, the passing of the "true" purpose of the private note issues, right to the last. The remarkable chapter in English banking, under the provisions of the Bank Charter Act of 1844, the right of issue lapsed on the amalgamation with Lloyd's Bank. Further, it marked the accomplishment of the principal aim of the Bank Act of 1844—that of reducing the private note issues of the country, for they now ceased altogether. In 1844 this note-issuing privilege was enjoyed by 133 banks, 72 joint stock banks, and although the Bank of England was entitled to increase the fiduciary portion of the note circulation by two-thirds of the lapsed issues, the Bank had apparently not availed itself of the full privilege, for out of the maximum issue of £8,631,000 vested in the defunct banks, the Bank of England had only increased its fiduciary circulation by £7,551,000 of the lapsed issues.

Big Five banking, then, has found its resting place in the archives of the things that have been, and the lesser lights of English joint stock banks are not far behind. As a matter of fact the number of English joint stock banks was reduced from 106 in 1891 to 20 in 1921, and throughout the whole of the United Kingdom, including the Bank of England and the private banks, the number of banks in 1891 had fallen from 111 in 1900 to 41 in 1921.

That the resources of the banks have not suffered by this process of amalgamation is strongly shown, for the question of resources is an all-important one. In many respects large banks are certainly preferable, because with large resources they are in a position to make advances on a much more generous scale than the smaller concerns. Matters have now reached a point where desirous that their resources should be prepared to adapt themselves to the entirely new order of things in the financial world brought about by the war.

Actually, there would not appear to have suffered from the fusion of the banks, for if we make a comparison of the figures of the English joint stock banks (the Scottish and Irish banks, except in a minor degree, were not much concerned with amalgamation), we find that there have been no large increases in capital and reserves; the ratio of total cash to demand liabilities has risen, and deposits show a striking increase. The ratio of paid-up capital and reserves to deposits has, however, fallen considerably, though the 1920 figures showed that the upward movement had recommenced. The following table will reveal the true position:

Increase in Deposits—Apart from the capital and reserves, which have shown nothing like the advances, must be considered for 1920-2 the satisfactory increase of £48,530,000, or 36% over the 1913-4 total, the first item which strikes one's attention here is the enormous increase in deposits, £1,777,590,000, or 142% over the 1913-4 figures. The increase in deposits was common to most, if not all, of the banks during the war period, and after. Various reasons have been assigned for it. Some bankers gravely asserted that many of the balances which went to swell their deposits represented money awaiting employment in trade, but, however, true that may have been during the trade slump of 1919-20, the true cause during the war were to be found in the public's rising out of the Government's war finance, while immediately after the war, the banks were certainly too free with their advances.

Each advance had the effect of adding to the deposits of the same or of other bank in the country, since when a person raises a loan on the bank the advance is immediately credited to the account. Obviously, then, an increase in bank loans and advances is concomitant with an increase in bank deposits, and as the Bankers' Magazine pointed out in regard to the war period "bankers were able to lend their loans in this manner because a large portion of the inflated deposits of the war period still remained with them as additional cash, notwithstanding the large sums which they invested in Treasury Bills or were prevailed upon to lock up in the various War Loans."

Undoubtedly, the increase in deposits was largely due to the immense creation of Government credits, which eventually
found their way into the pockets of producers, traders and wage-earners, and so on, to the banks. However, by the summer of 1921 the rate of increase in both deposits and current accounts showed signs of slackening, and there appeared to be little doubt that, whenever trade started to revive, the deposits of all the banks would fall away.

The increase in acceptances calls for little comment; it was falling steadily in 1921, and showed a decline of over £49,000,000 between 1920 and 1921.

Credit Facilities.—Discounts and advances gave the lie direct to the critics who asserted that the assistance of the bankers to trade was not forthcoming. It should be observed that the increase in discounts and advances together showed the very satisfactory increase of £26,323,000, or nearly 112.4%, and it proved that even if the bankers were scrutinizing more carefully the applications for discounts and advances in 1921, they were giving very active assistance to the finance of trade and industry, so far as was compatible with the precautions they were bound to consider in order to issue those of their depositors.

As a matter of fact, difficulties during the transitional period from war to peace were fully appreciated as long ago as 1916, when the Board of Trade appointed a committee to investigate the credit facilities. Another committee was also appointed for similar reasons towards the end of 1917.

The terms of reference to the latter body mainly consisted of (a) an inquiry into the financial needs of trade immediately after the war and the respect in which these needs would differ from the needs under normal conditions, (b) the provision of financial facilities to meet those needs. Briefly, the committee foresaw that there would be an increased demand for credit facilities during the reconstruction period; and that the character of the demand would differ from that of normal times in that it would consist of a greater demand for loans secured upon capital goods, compared with loans secured upon consumable goods. Further, the considered opinion of the committee on financial facilities in 1917 was, that to achieve the reconstruction of trade and industry on sound financial and economic lines, it would be necessary to re-establish a sound financial basis by means of an effective gold standard; to check any undue expansion of credit, and to take steps to reduce to more normal proportions the inflation of credit due to the war. In the banking world a movement towards this end had been gradually shaping itself, though progress up to 1921 had necessarily been slow owing to the bursting of the bubble of trade inflation, and labour troubles, and world-wide depression in trade during 1920.

That there would be some difficulty in providing the extended credit facilities which it was, foreseen, would be necessary, was recognized, and to meet this difficulty the committee of 1918 recommended, among other things, an increase in the capital of the banks, and the acceptance of deposits for longer periods at fixed rates of interest. They said:

"To enable the banks to do more in the direction of granting long term credits, we are of opinion that it is desirable that bankers should make more widely known their willingness to accept deposits for long periods, at fixed rates of interest. We believe that, if they were encouraged to do so, a number of depositors would be willing to deposit their money at fixed rates of interest, for periods of from one to five years, without the right of withdrawal. The removal of the liability to withdrawal would thus enable the banks to grant loans for longer periods."

"To a limited extent, effect was given to these recommendations, and in 1921 the banks were all striving to meet the abnormal conditions with which they were faced.

The London branches of the colonial banks, of course, always favoured the taking of fixed deposits at a comparatively high rate of interest; but it is doubtful if the movement is destined to extend greatly among the London joint stock banks who are called upon to maintain greater liquid balances to meet withdrawals that are their colonial confreres.

One good thing towards the solution of the difficulty in providing adequate banking facilities for trade was that which arose out of the recommendations of the Board of Trade committee of 1916. As the result of the deliberations of that committee it was resolved to form a new bank to fill the gap which was said to exist between the home banks and the colonial and British foreign banks and banking houses. The new institution was called the British Trade Corporation. Its constitution and functions were laid down by the committee to be:

1. To have a capital of £10,000,000. The first issue of stock, however, in the first instance, only a small amount should be paid up, bank should be fully capitalized within a reasonable time. A further issue to be made afterwards, if possible at a premium.

2. It should not accept deposits at call or short notice.

3. It should only open current accounts for parties who are proposing to make use of the overseas facilities which it would afford.

4. It should have a foreign exchange department where special facilities might be afforded for dealing with bills in foreign currency.

5. It should open a credit department for the issue of credits to members of the house and anyone else.

6. It should enter into banking agency arrangements with existing colonial or British foreign banks wherever they could be concluded upon reasonable terms, and where such arrangements were made, it should undertake not to set up for a specified period its own branches or agencies. It should have power to set up branches or agencies wherever the British foreign bank of importance existed.

7. It should inaugurate an information bureau.

8. It should endeavour not to interfere in any business for which banks and banking houses now provide facilities, and it should desire to cooperate with bankers on the establishment of a new bank or banks, and should invite other banks to submit to it new transactions which, owing to length of time, magnitude or other reasons, they are not prepared to undertake alone.

9. Where desirable, it would cooperate with the merchant and manufacturer, and possibly accept risks upon joint account.

10. It should become a centre for syndicate operations, availing itself of the special knowledge which it will possess through its information bureau.

The British Trade Corporation was designed to fill a gap in the financial machinery of the country and to supply needs which had been long felt by trade and industry. Apart from the assistance which it might be able to render in connexion with overseas contracts, the development of existing markets and the securing of new ones, its sphere of usefulness was a large one, and properly directed, it should prove of great value to the development of British trade, finance and industry.

Foreign Banking.—As a matter of interest in the trend of British banking, it may be noted that all the large joint stock banks had entered by 1921 into more or less extended foreign relations. All had proper branches devoted entirely to the financing and developing of overseas trade, and foreign exchange operations formed a much more important part of the work of all London banks than had been the case before the war.

The ramifications of some of them were by 1921 very wide: Bank of England, for instance, maintained a large foreign department in London and was also affiliated with the Anglo-Egyptian Bank. Lloyd's Bank, in company with the National Provincial Bank, had a subsidiary in the United States, the Union Bank, and a subsidiary of the National Provincial Foreign Bank, Ltd. The London County Westminster & Parr's Bank had a subsidiary bank called the London County Westminster & Parr's Foreign Bank, Ltd., and both Lloyd's and the London County Westminster & Parr's Bank were closely concerned in forming (1917) the British Italian Corporation in England and the Compagnia Italo-Britannica in Italy. The London Joint City & Midland Bank had formed no branches abroad, the view being that it was better to refrain from competing with foreign banks in their own centres; further, that besides being able to maintain amicable relations with foreign banks, a greater security was afforded to deposits and deposits which are the bank's activities showed a growing trend at home country. Some of the other banks who appeared to support this view had joined together and participated largely in the establishment of a bank known as the British Overseas Bank, which was making steady progress in the particular branch of banking for which it catered.

Altogether, then, whatever may have been the failings of the British bankers up to 1910 in the provision of means for financing trade and industry, in the provision of financial facilities for trade, to the foreign branches of the operations of their clients, there was in 1921 no lack of facilities for clients whose business called for operations in foreign and colonial currencies.

War Services.—A word remains to be said about the rise in the investment figures, which was a noteworthy feature of the aggregate balance sheets of the banks. The increase during the decade was £548,501,000, a little over 24%, and undoubtedly represented the bankers' subscriptions to the various war loans in which they had participated heavily. The banks' contribution to the Victory
and Funding loans alone, it was estimated, amounted to some £1,000,000,000. In June 1921, however, a small decline had recently been noticeable, and it seemed probable that, as time went on, the bankers would gradually divest themselves of a large portion of Government stocks.

Great services were rendered by the banks to the Government during the war. In most of the large loans that were floated the instalments were spread over a more or less lengthy period. In determining the amounts which the banks could conveniently handle account was taken of their reserve funds, which largely consisted of their deposits with the Bank of England. In describing the actual process of assisting the Government in this loan the Sir Edward Holden compared the payments with the revolutions of a wheel. The banks were described as placing in the wheel the payments they made for their customers who had subscribed for the loans; the wheel carried these payments to the credit of the Government with the Bank of England, and the subscribers received their securities. The Government then placed in the wheel cheques in payment of commodities and services rendered for conveyance to their creditors, and the creditors in turn used the wheel to carry the cheques to the credit of their accounts in the banks, thus reestablishing the banks' reserves and preparing them for another instalment. Another method by which the Government was helped by the banks was by the steady absorption of Treasury bills and other securities sold over the counter at the Bank of England. The banks also rendered invaluable service to the Government in making available their credit facilities with the Bank of England.

"To increase their clients' ability and their own ability to invest in Government issues they would borrow from the Bank of England. These loans would increase their deposits with the Bank of England, which, as reserves, would increase their ability to grant to their own clients loans equivalent to, say, five times such loans; and the banks would be able to invest this sum in Government on "Ways and Means" they were of important assistance. The manner in which these Ways and Means advances operated may be best described in the words of the Committee on Currency and Foreign Exchanges after the war:

"Suppose for example, in a given week the Government require £10 million over and above receipts from taxes and loans from the public. They apply for an advance from the Bank of England, which by a book entry places the amount required to the credit of public deposits. The amount is then paid out to Government creditors, and passes, when the cheques are cleared, to the credit of their accounts in the banks and in the Bank of England—in other words, is transferred from 'Public' to 'Other' deposits, the effect of the whole transaction thus being to increase by £10 million the purchasing power in the hands of the public in the form of deposits in the banks and the bankers' cash at the Bank of England by the same amount. The banks' liabilities to depositors having thus increased by £10 million and their cash reserves by an equal amount, their proportion of cash to liabilities (which was normally before the war something under 20%) is improved, with the result that they are in a position to make advances to their customers to an amount equal to four or five times the sum added to their cash reserves, or, in the absence of demand for such accommodation, to increase their investments by the difference between the cash received and the proportion they require to hold against the increase of their deposit liabilities. Since the outbreak of war it is the second principle, together with the main one already outlined, that has been used to subside for Treasury Bills and other Government securities. The money so subscribed has again been spent by the Government and returned in the manner described to the banks' cash balances, the process being repeated again and again, until each £10,000,000 originally advanced by the Bank of England has created new deposits representing new purchasing power to some extent."  

It may be noted, in connexion with the part played by the great joint stock banks in the raising of war loans, that for the first time they were made collecting agents, being so named in the prospectuses with the Bank of England.

**Note Issues.**—The note circulation of the English joint stock banks remained in 1921 practically unchanged at £174,000,000. Scottish notes, it was found, were on the increase, while Irish notes showed a considerable decline. The expansion of the paper currency of the United Kingdom may be shown as follows, the increases since 1913 being 279% for the Scottish, 206% for the Irish, and 349% for the Bank of England notes:

The total issue of the Bank of England against securities is known as the Fiduciary Issue, and on June 30 1914, the amount of this issue was £18,450,000, while the Bank of England notes issued against gold coin and bullion, under the provisions of the Bank Charter Act of 1844, amounted to £58,476,000. As showing how the bank's note issue increased during the war and the period following it, it may be observed that the notes in circulation on June 30 1914 had to be temporary, as a security for which the Government debt amounted to £111,021,000, other securities to £7,434,000, giving an excess circulation over the authorized issue against securities of £1,26,543,235, all duly covered by the deposit of gold coin and bullion in the Issue Department.

The Committee on Currency and Foreign Exchanges after the war sat in 1918 and 1919, under Lord Cunliffe's chairmanship, to consider among other things the working of the Bank Act, 1844, and the constitution and functions of the Bank of England, with a view to recommending any alterations which might appear to be necessary or desirable. Briefly, the conclusion they came to was that the principles of the Act of 1844, which upon the whole had been fully justified by experience, should be maintained, namely, that there should be a fixed fiduciary issue beyond which, subject to emergency arrangements, notes should only be issued in exchange for gold. They said in their report:

"It is noteworthy that from 1886 till the outbreak of the war (1914) no suspension of the Act was ever necessary." The Committee considered that the stringent principles of the Act had often had the effect of preventing dangerous developments, and that it was bound to be temporary or expedient at certain rare and exceptional occasions (and those limited to the earlier years of the Act's operation when experience of the working of the system was still immature), but not, in their opinion, invalidate this conclusion. The Committee therefore recommended that the separation of the issue and banking departments of the bank should be maintained, and that the weekly return should continue to be published in its old form. The possibility of so modifying the Act of 1844 as to make provision for the issue of emergency currency in times of acute difficulty was, however, carefully considered. They said that it might, no doubt, be sufficient to leave matters as they were prior to 1914, and to risk the possibility of the law having to be broken, subject to indemnity from Parliament, but evidently the Committee were alive to the objections that had been expressed in many quarters to this procedure. Their report states:—"We are, therefore, of opinion that the provisions of Section 3 of the Currency and Bank Notes Act, 1914, under which the Bank of England may, with the consent of the Treasury, temporarily issue notes in excess of the legal limit, should be continued in force. It should be provided by statute that the consent should be informed forthwith of any action taken by the Treasury under this provision by means of a Treasury Minute which should be laid before both Houses. The statute should also provide that any profits derived from the excess should be surrendered by the Bank to the Exchequer." The Committee add:—"It will, of course, be necessary that the Bank Rate should be raised to, and maintained at, a figure sufficiently high to secure the earliest possible retirement of the excess issue."
The following table records the changes in the Bank of England rate from 1911 to 1920:

*Seven settlements only. †Eighteen settlements only.

The Definition of a "Bank."—One good result of the British banking amalgamations which the critics of the policy nearly always overlooked is the elimination of the weaker vessels. Even a cursory glance at the figures will convince the reader that amalgamations have given added stability to the British banks, and this cannot but be beneficial to the general public and to the commercial community. The amalgamated institutions, moreover, have been unconnected with any failures; indeed, many times they have been the means of averting bankruptcies and panics. They came through the backwash of the American financial panic of 1907-8 with a firmly established reputation for that conservatism which means strength, and just as they emerged from the black times of the Baring crisis years ago, so have they passed through the critical periods of the war years, 1914-8, with added lustre. In the monetary stringency that befell Europe on the outbreak of war, and brought many of the European bourses on the verge of disaster, it was borne upon the public what a useful function is performed by the great banks of the United Kingdom in the banking crises and creating confidence in British financial methods.

It is true that between 1910 and 1921 there were one or two failures which brought disaster to many of the poorer folk. But these failures were not by "banks" in any proper sense of the word. One was the Charing Cross Bank, which failed in Oct. 1910. It was nothing more or less than a money-lending concern. When it closed its doors it brought ruin to a large number of poor people who, tempted by high rates of interest, had deposited their savings with the institution. Practically nothing was saved from the wreck brought about by the folly of a man, named A. W. Carpenter, who was the sole proprietor of the concern. Then there was the Birbeck Bank, which went into liquidation on June 8, 1911, mainly through its connexion with building society finance. In this instance, the consequences were not so disastrous, since, largely, as the outcome of the assistance of the joint stock banks in the liquidation, the depositors were ultimately paid nearly in full. More recently, on Dec. 30, 1920, history repeated itself, and the public was startled by the failure of Farrow's Bank, an institution carried on under the chairmanship of Mr. Thomas Farrow, who was sentenced to four years' penal servitude in connexion with the publication of false balance sheets of the so-called bank. The failure of this bank caused little surprise in banking circles; but, as usual, a large number of depositors of the small tradesman and artisan class were ruined by the failure. As with other institutions of this type, it was the same old story—the public lured by high rates of interest offered on current accounts and small deposits. When the bank failed it had succeeded in obtaining from the public approximately £1,438,000 in current accounts and £2,679,000 in short deposits, and up to July 1921 all that it had been possible to pay to the depositors was 2s. in the £, and there seemed no probability of anyone receiving more than 5s. in the £ in final settlement.

In each case the failures gave prominence to the necessity for limiting the use of the title "bank" to institutions that really are banks. It also emphasized the necessity for the great joint stock banks to encourage the small depositor, with the result that most of them now advertise their willingness to open small deposit accounts at rates of interest consistent with prudent banking.

Immediately following the failure of the Charing Cross Bank the question was raised—"What is a bank?" and there was a demand for a definite ruling on the subject. It is curious, but true, that no Act up to 1921 had ever said what was the meaning of the word "bank," and what is still more curious, there was no decision of a Court of Law on this point. All the Bills of Exchange Act of 1882 says is—"A banker includes a body of persons whether incorporated or not, who carry on the business of banking—a definition which has never had the slightest use in preventing scandals that have arisen in connexion with such organisations as the Charing Cross Bank. It is necessary to bring the pressure of the law to bear in the case of a bank which has failed, but the danger in connexion with small deposit accounts is that the public, which has been insulated by the absence of a central bank, will now assume the attitude that a bank is a bank wherever the depositors have been deceived."

The objection to this definition, it was considered, lay in the words "main business," a general term which itself calls for explanation. It was urged that the main business of a bank is not in the receipt of money from the public, but in the re-lending of that money. Consequently, an alternative definition was proposed in the following terms:

The expression "bank" means any persons who hold themselves out as carrying on the business of receiving from the public current account money which is to be repayable on demand by cheque, or who use the word 'bank' or any derivative of that word as part of the title or description under which they carry on business.

What, however, was considered to be even a better definition was that given by the American Co., a bank of the Institute of Bankers, London, Dr. Walter Leaf, in his address to the Institute of Bankers in Nov. 1920, namely:

The expression "bank" means any persons who receive from the public on current account money which is to be repayable on demand by cheque, or who use the word 'bank' or any derivative of that word as part of the title under which they carry on business.

A good deal was said on the matter at the meeting in question, and most bankers present were in agreement with the president when he said that what actually was needed was a register of bankers which could be established without a hard and fast definition. Further, a tribunal should be set up with power to admit applicants or reject them from incorporation in the register on a wide view of all the circumstances of their business. This tribunal, it was argued, should be representative, not only of Government Departments, but of industry and commerce, as well as of existing banks. If such a register were set up no
one would be allowed to use the name of a bank or any derivative from it unless his name was included in the register. On all such registered banks such obligations as the publication of accounts, and so forth, would be imposed as might be thought desirable.

In the meantime the Government itself had in 1913–14 a bill under consideration which was intended to include the principal points put forward. But during 1921 it seemed to have found its resting-place in the archives of the Board of Trade.

Certainly the suggested register of bankers carries us a step farther than previous efforts have done. Sir John Paget, the eminent banking counsel, had constantly urged the necessity for reform in this matter, and in a letter to the Journal of the Institute of Bankers he pointed out in 1920 that the register plan offered finally where finality was sorely needed, elasticity where expansion was called for. As he said, the register would not necessarily be either an Index Explanatorius or a Book of the Righteous; it would be a true guide and friend. It would not be derogatory to bankers, for registration is both recognized and adopted in all professions. The Stock Exchange has its official list of members; the Law List is the register of counsel and solicitors, and when we come to medicine and surgery we find in the Medical Register and the General Medical Council the complete exemplar of a register and tribunal which, as Sir John Paget has argued very reasonably, might well be the pattern to be followed by the bankers. Unfortunately the blunder made by the Government in insisting on a bankers supervising the transactions (for controlling amalgamation), which was so badly drafted that it had to be withdrawn, seemed to have discouraged official action.

Overseas British Banking.—The recent tendency of the English joint stock banks to take an interest in overseas banking has already been mentioned. Apparently, they had not yet in 1921 reached the point of carrying the process of amalgamation into unions with the colonial banks, though, as it happens, in 1919, pourparlers were taking place between representatives of Lloyd’s Bank and the National Bank of India for the purchase of the shares of the latter. However, before the negotiations had reached a head the British Treasury intervened and vetoed the transaction. Nevertheless, there was an important development in India, namely the amalgamation of the three Presidency Banks, the Bank of Bengal, the Bank of Bombay, and the Bank of Madras, which, under an Act passed by the Indian Legislative Council in 1920, became united on Jan. 27, 1921, and were henceforth to do business as the Imperial Bank of India. As is well known, the old Presidency Banks under the former régime were restricted in their operations; they were looked upon as semi-official institutions and as 'bankers' banks.' Under the Presidency Banks Act of 1866 they were prohibited from doing any business in the paying or taking deposits payable outside India. They were not permitted to make loans for longer periods than six months, or to advance on mortgage, or on immovable property, or upon promissory notes bearing less than two independent names, or upon goods, unless the goods or the title to them were deposited with the banks as security. Under the constitution of the new Imperial Bank of India, these disabilities are to a large extent removed; the bank is empowered to do most of the business which the Presidency Banks were formerly prohibited from doing. Besides acting as a reserve for the Government, the new Imperial Bank is permitted to have an office in London, and to rediscount the bills for the Exchange Bank and other banks. It does not, however, compete with the Exchange Banks in ordinary exchange business. The appointment of the bank as the Indian Government’s sole bank in India will make for economy, for it will enable the Government to abolish the expensive Reserve Treasuries in India, and the business hitherto conducted in that connection by the Government will be done by the Imperial Bank. To render this possible, the Imperial Bank undertook to establish and to maintain within five years no fewer than 100 new branches, not less than one-fourth of which would be opened at such places as the Government might consider desirable.

It will be convenient at this point if we give particulars of the banks before the amalgamation and the position as it stood in June 1921.

### Resources of the Indian Presidency Banks before They Were Absorbed by the Imperial Bank of India

| Bank of Bengal | 200 | 210 | 388 | 3439 | 1244 |
| Bank of Bombay | 100 | 125 | 187 | 2650 | 980 |
| Bank of Madras | 75 | 45 | 124 | 2228 | 455 |
| **Total** | **375** | **380** | **699** | **8317** | **2679** |

(Figures are in lakhs of rupees—one lakh = 100,000 rupees)

### Liabilities

| Subscribed capital | Rs. 9,89,60 | Government securities | Rs. 9,56,82 |
| Capital paid up | 5,28,65 | Other securities | 1,28,40 |
| Reserve | 3,69,14 | Loans | 14,76,68 |
| Public deposits | 12,89,10 | Bank notes | 2,05,71 |
| Other deposits | 66,17,16 | Inland bills | 15,03,16 |
| Loans against securities, per contra | 16,87 | Foreign bills | 38 |
| Sundryes | 11,21,25 | Bullion | 6 |
| **Total Liabilities** | **Rs. 89,32,17** | Dead stock | 2,09,04 |
| **Total assets** | **Rs. 89,32,17** | Sundries | 37,39 |
| | | Balance with other banks | 19,26 |
| | | Cash | 24,95,27 |

The above includes:

- Deposits in London £ 34,500
- Advances in London 130,300
- Cash and balances at other banks in London 130,607

The establishment of this bank is, of course, a great step forward in the banking development of India; it centralizes the operations of three large banks, but gives them larger working resources and a much larger scope. A further advantage is found in the fact that although the Government is fully represented the main working of the central concern is in the hands of private individuals. The president and vice-presidents are the representatives of the shareholders, and practically the only Government officials on the central board are the controller of the currency, not more than four nominees of the Government, and one or two managing governors appointed by the Indian Government in consultation with the central board. The first two governors were Sir N. Warren and Sir R. Atkinson, who were formerly secretaries and treasurers of the Banks of Bengal and Bombay respectively, whilst the first London manager was Sir Bernard Hunter, who held formerly the position of secretary and treasurer of the Bank of Madras. Subsidiary to the central board, forming the main governing body, there were to be the local boards, the latter being the existing boards of the amalgamated institutions in the three presidency towns. The central board was to function much in the same way as the Lords of the Treasury does in England. It deals with matters of general policy, such as the movement of funds from one part of India to another, the fixation of the Indian Bank rate, which will in future be uniform for the whole of India, and the publication of the weekly statement.

The local boards, under the general control of the central board, were to have a very free hand in administering the affairs of the bank, and, altogether, the whole administration was designed to carry on the work of the previous Presidency Banks with the minimum of disturbance and the maximum of efficiency.

Precisely what business the Imperial Bank was in 1921 authorized to transact was set out in the following schedule of the Imperial Bank of India Act:

The bank is authorized to carry on and transact the several kinds of business hereinafter specified, namely:

(1.) The advancing of new money, and opening cash credits upon the security of: (I.) stocks, funds and securities (other than immovable property) in which a trustee is authorized to invest trust money by any Act of Parliament or by any Act of the Governor-General in Council and any securities of a local Government or the Government of Ceylon.

(II.) Such securities issued by State-aided railways as have been notified by the Governor-General in Council under section 36 of the Indian Railways Bank Act, 1876, or may be notified by him under this Act in that behalf.

(III.) Debentures or other securities for money issued under the authority of any Act of incorporation established in British India by, or on behalf of, a district board.

(IV) Goods which, or the documents of title to which, are deposited with, or assigned to, the bank as security for such advances, loans or credits.

(b) Bills of exchange and promissory notes endorsed by the payees and joint and several promissory notes of two or more persons or firms unconnected with each other in general partnership.

(VI) Fully paid shares and debentures of companies with limited liability, or immovable property or documents of title relating thereto as collateral security only where the original security is one of the kinds specified in sub-clause (V) of Part I, and if so authorized by any general or special directions of the central board, where the original security is of the kind specified in sub-clause (V) provided that such advances and loans may be made, if the central board thinks fit, to the Secretary of State for India in Council, without any specific security.

(b) The selling and realization of the proceeds of sale of any such property as is mentioned in clause (a) and the stock, shares, securities or goods which, or the documents of title to which, have been deposited with, or assigned to, the bank as security for such advances, loans or credits, or which are held by the bank or over which the bank is entitled to any lien or charge in respect of any such loan or advance or credit or any debt or claim of the bank, and which have not been redeemed in due time in accordance with the terms and conditions (if any) of such deposit or assignment.

(c) The advancing and lending money to Courts of Wards upon the security of estates in their charge or under their superintendence and control, and the proceeds of such sales, and where the estate, or the proceeds thereof, provided that no such advance or loan shall be made without the previous sanction of the local Government concerned, and that the period for which any such advance or loan is made shall not exceed six months.

(d) The drawing, accepting, discounting, buying and selling of bills of exchange and other negotiable securities payable in India, or to Ceylon, or to the United States, or to any country, in the general or special directions of the Governor-General in Council, the discounting, buying and selling of bills of exchange, payable outside India, for and from or to such banks as the Governor-General in Council may approve in that behalf.

(e) The investing of the funds of the bank upon any of the securities specified in sub-clauses (I) to (III) of clause (c) and converting the same into money when required, and altering, converting, and investing the same for the purpose of investments for or into other investments above specified.

(f) The making, issuing and circulating of bank-post bills and letters of credit made payable in India, or in Ceylon, to order or otherwise than to the bearer on demand.

(g) The buying and selling of gold and silver whether coined or uncoined.

(h) The receiving of deposits and keeping cash accounts on such terms as may be agreed on.

(i) The acceptance of the charge of plate, jewels, title-deeds or other valuable goods on such terms as may be agreed on.

(j) Any other business, whether movable or immovable, which may in any way come into the possession of the bank in satisfaction or part satisfaction of any of its claims.

(k) Any business or any other business not already in operation.

(l) The acting as administrator, executor or trustee for the purpose of winding up estates and the acting as agent on commission in the transaction of the following kinds of business, namely:

(i) The remittance of such proceeds at the risk of the principal by public or private bills of exchange, payable either in India or elsewhere.

(ii) The drawing of bills of exchange and the granting of letters of credit payable out of India, for the use of principals for the purpose of the remittances mentioned in clause (i) and also for private constituents for bona fide personal needs.

(iii) The discounting, buying, selling and remitting such bills or letters of credit, of bills of exchange payable out of India, at any usance not exceeding six months.

(iv) The borrowing of money in India for the purpose of paying such bills or letters of credit.

(v) The borrowing of money in England for the purpose of paying such bills or letters of credit.

(vi) The purchasing of all such sales and purchases of goods as may be incidental or subsidiary to the transacting of the various kinds of business hereinafter specified.

(vii) The business which the bank was not authorized to carry out or transact was set out in Part II, which stated:

The bank shall not transact any kind of banking business other than that specified in Part I, and in particular,

(a) It shall not make, renew or advance (a) for a longer period than six months, or (b) upon the security of stock or shares of the bank, or (c) save in the case of the estates specified in clause (c) of Part I, upon the mortgage or in any other manner upon the security of any immovable property, or the documents of title relating thereto.

(b) The bank shall not (except upon a security of the kind specified in clause (a) of Part I) to discount any bills of exchange or bills of exchange or drafts on any individual or partnership firm for an amount exceeding in the whole at any one time such sum as may be prescribed, or lend or advance on any way whatever any sum of money exceeding in the whole at any one time such sum as may be so prescribed.

(c) The bank shall not discount or buy, or advance and lend, or open cash-credits on the security of any negotiable security having at the date of the transaction a longer period to run than six months or, if drawn after sight, drawn for a longer period than six months.

Provided that nothing in this Part shall be deemed to prevent the bank from allowing any person who keeps an account with the bank to overdraw such account, without security, to such extent as may be prescribed.

Amalgamation of the Imperial Bank of India was an important step forward for India, and the results could not but be far-reaching. As the Governor of India said in the course of the speech before the Governor-General, the mere appearance in districts of a bank which would conduct the business of the Reserve Bank in a large way, and which would be independent of the local banking system, and as to whose stability there would be no doubt, must in course of time have an appreciable effect upon the native attitude towards banking in general. Whether it would be successful in attracting the large deposits of wealth that can exist in India remained to be seen, but if it were allowed to be successful, the other native banks would have the benefit of a powerful central institution to which they could look for guidance, upon which they could rely in matters of a general nature, and which might hasten the development of the various classes of banking in India, agricultural, industrial and joint stock banks. The internal trade of the country might be felt, and benefit by the extension of branches which it was the declared policy of the Imperial Bank to set up.1

We may now turn from a consideration of this most important development in Indian banking to a similar stride forward in South Africa, in the establishment of the South African Reserve Bank, which received its charter under the South African Currency and Bank Act of 1920.

The Imperial Bank of India, it was to be a private institution, half the capital being subscribed by the banks doing business in the South African Union in proportion to their paid-up capital and reserve funds, and the other half provided by public subscription. If the applications from the public fell short of the 50% required, the balance would be made up from public funds. The bank was to be established first at Pretoria.

The affairs of the bank were to be managed by a Reserve Board consisting of eleven members, three being men experienced in banking and finance, and three (actively engaged in business at the time of appointment) representative of commerce, agriculture and industry. Three others were to be appointed by the Government. A governor and deputy-governor (who must be persons of banking experience) were to be appointed by the Governor-General and to hold office for five years. The person selected for the seat of the first governor was Mr. W. H. Clegg, who, prior to his appointment, was the chief accountant at the Bank of England.

Like the Reserve Bank of America, the object of the new South African banking system is to consolidate the financial system of the country by establishing the existing banks as one institution. Further, the keeping of balances of other banks at the Reserve Bank will have the effect of making the central institution the sole custodian of the banking reserve of the country, a feature which is evidenced already from the English system. The reserve regulations must make the expansion of the note issue dependent on trade demands, and when the system is properly functioning it is expected there will be a much greater elasticity of the currency than formerly in South Africa.

For a period of 25 years from its inception the bank will have the sole right of issuing notes within the South African Union. The other banks are not ignored; but their notes will be given time to exist, and in time it is hoped a great many new issues will be taken up in the Union. The regulations regarding their own note issues; they will be allowed to continue the issue of their notes for 12 months, and if the Reserve Bank is then in a position to issue its own notes, they will be called upon to retire their notes gradually, and when all had lapsed (within two years, 1 Cf. Economic Journal, June 1921.
it was hoped), the Reserve Bank would be the only bank of issue in the Union. However, the other banks' issues, even in the transitory periods, will require to be backed by a minimum gold reserve of 40%, and for any excess circulation over that of Dec. 31, 1919, the discount tax would be at 24%.

The South African Reserve Bank itself will be obliged to maintain a minimum gold reserve of 40% against its note issue, but the remaining 60% may be covered by commercial bills, and by a fixed charge on all the assets of the bank. Further, it must keep a minimum gold reserve of 40% against its deposits and bills payable.

The bank will act as the Government's bankers and financial agents, and will set discount rates. It is empowered to set up branches in any part of the South African Union, and, subject to the consent of the Treasury, may open branches outside the Union.

The business in which the bank may participate does not differ materially from that done by other banks within the South African Union, with this exception, that it will not be allowed to receive time deposits, nor to draw or to accept bills payable otherwise than on demand. The use of bills of exchange is to be restricted to 90 days, except bills or notes arising out of agricultural finance, for which the usage is limited to six months. However, all bills must bear at least two good signatures. Dealsings in these six-months' bills are limited to 20% of the bank's total advances, so there is not much risk of such finance embarrassing the bank.

The principles of the other business allowed to be undertaken by the bank closely resemble those peculiar to the Bank of England, and most of the regulations governing it are designed with a view to giving the country the greatest possible financial assistance in times of crisis or difficulty. This was the first central bank established in the British Dominions, its progress will be watched with keen interest both at home and abroad, and as Sir Henry Strakosch has said, "In the life of a large bank, founded not for speculation, but to perform the service which South Africa Act should be capable, under wise management, of adequately fulfilling the functions for which it was set up."

Another new development of importance in colonial banking since 1910 has been seen in the establishment in Australia in 1912 of a new Commonwealth Bank. For the purpose of starting this bank a special Act of the Federal Parliament was necessary; it is called the Commonwealth Bank Act of 1911-4. The bank commenced business early in 1913, and by 1921 had safely stood the test which was placed upon it. It has become one of the recognized financial institutions of the Commonwealth, and it has not only been a steady influence to the Australian financial and banking position, but has given added stability to the banks in the Commonwealth, and has certainly strengthened the Commonwealth's position. It was, of course, the first State bank in the British Empire, and it is owned entirely by the Australian Commonwealth Government. The bank has no share capital and all its obligations are guaranteed by the Government. There is no board of directors, and the whole concern is conducted by the Government. Of necessity, however, the bank must be closely in touch with the Government. It is responsible for practically all the Government's business; it conducts the Government's savings banks at all its branches, and is largely responsible for 2,800 agencies at the Australian post-Offices. It also undertakes the flotation of the Australian loans in London, and manages the Government stocks much in the same way as the Bank of England attends to Government issues. It is also responsible for the gold which is produced in Australia, and for the federal note circulation. The net profits of the bank are utilized in the building up of reserves, in paying the profit to the credit of any called the Bank Reserve Fund, and the other half to the credit of a reserve called the Redemption Fund. Each of these reserves stood in 1921 at £1,378,052. The Bank Reserve Fund is available for the liabilities of the bank, while the Redemption Fund may be utilized for repayment of any money advanced to the Australian Treasury or in the redemption of stock issued by the bank, but there is a proviso to the effect that if the fund exceed the amount of debentures or stock in existence, the excess may be used for the purpose of the redemption of any Commonwealth Debentures taken over by the Commonwealth.

During the eight years in which the bank had been in existence up to 1921 it had accumulated profits of £2,756,104: it started with the head office in Australia and one branch in London; it had in 1921 six offices in Australia, two in London, and over 30 branches and sub-branches in all the provinces of Australia, Tasmania and New Britain. Its deposits exceeded £41,000,000, added to which the savings-bank deposits amounted to £78,828,000. Its total liabilities to the public on June 30, 1920, were £60,658,600, against which assets were held in the following approximate proportions: cash, 10%; Australian notes, 3%; investments, 31%; bills discounted and advances, 56%.

Although the Bank may be said to have justified its existence, the fact that the Australian Government, besides being the proprietor of the Commonwealth Bank, is largely interested in trade matters in Australia, is considered to be a drawback to the system of central banking, and it seems likely that the Australians will watch the South African Reserve Bank and will possibly endeavour to develop a similar system for their own country. The Commonwealth Bank, it is held, indicates a very hopeful road towards reform, and the system is certain to receive serious consideration from Australia and most other parts of the Empire. Critics have said that a central bank in Australia would be necessary, because the Commonwealth Bank will secure for the internal finance of the Union, and that really is what is wanted in Australia. The establishment of the South African Reserve Bank is a step towards greater cooperation in banking and currency matters in a form and on a scale which had been difficult, if not impossible, up to 1921. From the imperial point of view the establishment of such a bank is an event of as much importance as the independence of the Commonwealth, the establishment of the United States Federal Reserve system, and it is to be hoped that further developments of the same nature will follow and so enable the British Empire to escape from the charge that co-operation, between the provinces of the British Commonwealth, has been too feeble, and that London and Montreal, presents greater difficulties than cooperation between London and New York.
lacking the British Empire is in central banks, it certainly does not lack branch banks for the use of its nationals; what is needed is the coordination of the several systems. 

(W. F. S.)

II. United States. Subsequently to the panic of 1907 and the recovery which followed, the banking system of the United States entered upon a period of prosperity and success which continued practically unbroken to the autumn of 1920. In the autumn of 1920 the development of post-war reaction in business and a violent shrinkage of prices brought severe pressure to bear upon all the elements of the banking system of the United States, but this was not sufficient to cause any dangerous shock. The period in question was one of unusual importance in American banking, not only because of the organization of the Federal Reserve system in which all national banks were compelled by law to assume membership, but also because of the fact that the strongest state banks and trust companies voluntarily entered the system during the first three years after its formation, with correspondingly broad effects upon financial organization, while the effects of the war and the expansion of American industry which accompanied the struggle greatly enlarged the activity of American banking and added to its profits.

Pre-War Period.—The years 1908-13 were characterized by a steady and consistent growth of business. In the following table, which shows the advance in the number of established banks as well as their chief assets and liabilities, the increase of operations may be noted during the five years in question, and may be compared with the advance during the war period:

In order to show the relative position occupied by the national banks, the following tabular comparison, relating to national institutions only, is presented. It will be understood that while the state banks and trust companies included in their number the bulk of the investment institutions of the nation, the commercial banking assets were predominantly held by the national banks.

The period 1908-13 was not, however, notable for any far-reaching changes in method or organization; provisions which had been enacted in the Aldrich-Vreeland law of May 30 1908 for the formation of national currency associations (see Federal Reserve Banking System) remaining practically a dead letter. There being no immediate or urgent necessity for the creation of national currency associations, since no disturbance in business conditions seemed to be imminent, the national banks made no effort to form them.

Principal Items of Resources and Liabilities of National, State, Savings, Private Banks, Loan and Trust Companies from 1900 to 1920. Compiled from reports obtained by the Comptroller of the Currency.

(In millions of dollars)

In the “Aldrich Bill”) had small chance of success so that at no time prior to 1913 was there a serious prospect of fundamental change in legislation. The adoption of the Federal Reserve Act in the latter year greatly altered the conditions under which the national banking system, and indeed the whole banking system of the United States, was operating, but it did not produce any direct or immediate effect upon the methods or position of the banks themselves until a much later date. Indeed, the Federal Reserve Act itself did not come into practical operation until nearly a year subsequently to its passage, the reserve banks being organized in Nov. 1914. During the pre-war years, however, the problems of the national banking system which had already been recognized had been growing more and
more obvious. Prominent among these was the insufficiency of the note currency, which continued to be issued solely upon the security of national bonds. In the accompanying table the note issues of the national banks during the years in question may be traced:

2 In the assembling of data in relation to savings banks the classification of banks as made by the State banking departments is closely followed, in consequence of which a number of so-called State savings banks, formerly treated by the Comptroller’s office as savings banks, have been regarded as commercial banks. The returns therefore are combined with the latter, which accounts for the relatively small amount of deposits reported for stock savings banks since 1915.

2 Dividends unpaid not included.

The number of trust companies and information with reference to the principal items of assets and liabilities on or about June 30 of each year since 1914 are shown in the following table:

1 Notes redeemed but not assayed by denominations.

The figures show a practically stationary condition of the circulation. They cannot, however, throw light upon the increasing volume of demand for currency, which during those years was growing at a rapid rate. Only through an enlarged use of checks and other credit substitutes or through additions to the basic monetary circulation itself was it possible for the United States to add to its circulating medium. Another factor which had assumed very great importance during the preliminary period referred to, was the growth of trust companies, involving as it did sharp competition with national banks. Subsequently to the year 1890 there had been a rapid development of trust companies in many parts of the United States as well as extension and improvement of legislation affecting them. In some states the trust companies, either through local restriction or as the result of custom, still confined themselves to fiduciary business, but under the laws of most commonwealths they had taken on banking functions, and in some states they had developed the latter to such a degree as to make their preliminary or nominal purposes largely secondary. Due to the fact that trust company laws were usually much less restrictive than those which controlled the operation either of national banks or of state banks, both of the latter classes of institutions were feeling the competition of the trust companies with considerable severity. The table on the next page shows the relative positions of different classes of banks in 1920 and the increase in the number of trust companies and savings banks during recent years.

Savings banks’ development during this period is shown in the following figures:

While commercial banks, both national and state, had from time to time considered the question of seeking permission to exercise fiduciary functions, the problem had never assumed any considerable importance until the Federal Reserve Act was brought up for consideration. Their policy had been directed towards enforcing a limitation or restriction of the banking functions of trust companies, both in the states where local legislation had not made much direct concession to trust company activity, and in those where a beginning had already been made in extending to them banking powers, rather than competing with them. One demand which had been made with entire justice by the national banks had been that in so far as they exercised actual banking functions and became liable for demand deposits, the trust companies should be required to keep a proportion of reserve equal to that required of the banks with which they were competing. Something had been done in the direction of applying such a requirement, but state laws were still in an unsatisfactory condition.

The Opening of the World War.—The year 1914 had opened prosperously for the banks of the country, business being practically normal and employment at least up to the average, while agricultural conditions were satisfactory. The sudden advent of war in Europe at the end of July, however, necessarily subjected the banks to a very severe shock. Due to the seasonal character of American exportations of agricultural products

</table>

and of many of the importations of manufactures, it had become customary in past years for English banks to hold claims upon American institutions which gradually accumulated each year up to the opening of the autumn season, when the movement of crops to foreign countries provided funds which were used for the cancellation of these balances. At the opening of the war it was supposed that in trade with England such balances against American banks amounted to something like $500,000,000. One phase of Great Britain’s economic policy upon the outbreak of war was to call in the balances due to her in foreign countries and generally to cut off trade relations that might subject her credit structure to fresh demands. At the same time the presence of German war-vessels in the Atlantic made it uncertain how long a time must elapse before the movement of goods to and from Europe would be resumed upon a normal basis. The export trade of the United States was thus seriously checked at the same time that extensions of credit by British banks were practically suspended. One immediate effect of this situation was to cause a large exportation of gold from the United States, while the shipment of goods was first reduced, and at last temporarily suspended. These two factors caused serious disturbances in the eastern part of the country and produced a general lack of confidence, while at the same time they tended to depress the prices of American staples. Cotton was affected with particular seriousness, its price declining during the autumn to a point as low as five cents per pound as against a figure, then regarded as normal or satisfactory, of 12 or 13 cents in the early part of the year. In consequence of this stagnation of export trade, there was a somewhat corresponding shock to domestic business, a resulting difficulty in making collections, and eventually a withdrawal of funds from banks not only for export of specie, but also for the purpose of domestic hoarding. Congress, which was then in session, hastened to amend the Aldrich-Vreeland Act of 1908, the measure thus adopted taking effect on Aug. 4, 1914. Under the terms of this amendatory measure the issue of emergency currency was prohibited, and instead, a series of bonds, under more liberal conditions than before. It would have been much better if the Federal Reserve Act, which was passed during the preceding Dec., had been brought into operation, but as a matter of fact reserve banks did not get under way until Nov. 1914. The action of Congress in passing the emergency currency law was, therefore, necessary in order to provide an immediate means of furnishing funds for the payment of depositors. The currency thus provided for under the new law was accordingly issued and eventually rose to a peak point of about $430,000,000. This served to take the place of gold which was then moving out of the country, the total gold exports during 1914 amounting to approximately $223,000,000. Meanwhile the Federal Reserve Board had been organized in accordance with the terms of the Federal Reserve Act on Aug. 10, 1914, and was immediately confronted by the great losses of gold which were being incurred by the banks in order to satisfy the demands of British creditors. In the belief that much of this withdrawal of gold was due to a lack of combined action on the part of the American banks, the board supervised the formation of what became known as the "international exchange fund," or "gold pool," which was in effect an agreement among American banks to provide a total of $100,000,000 of gold for export (or gold exchange), permitting any bank that might be drawn upon to supply itself from the common stock by depositing therein satisfactory funds in other forms. This measure was effective in restoring confidence while at the same time the first fear and uncertainty that had resulted from war conditions began rapidly to disappear; German vessels were soon driven from the North Atlantic and the movement of products from the United States to Europe was resumed upon a limited scale. The urgency of demands for cash declined and the banks (which had begun the issue of clearing-house certificates on Aug. 3) were able to retire their obligations on Dec. 1, although the Stock Exchange (which had been closed on July 31) was not reopened until later. Thus the banks of the country passed through the dangerous early stages of the war partly by exercising their own latent power and partly in consequence of the aid which had been extended to them through Congressional enactment and through cooperative effort under the leadership of the Federal Reserve Board.

The Banks and the Federal Reserve System.—The projected text of the Federal Reserve Act had been made public in June 1913, and had served as a basis for discussion from that date up to the passage of the Act on Dec. 23 of the same year. It may fairly be said that practically all of the banks of the country were opposed to it—the national banks primarily because it made membership in the system compulsory; the other banks because they feared that great changes and innovations in business would result from the new system. After the adoption of the Federal Reserve Act the question whether or not to enter the system became acute with national banks since the law had provided that a failure of any national bank to enter the system would mean the necessity of surrendering its charter and transferring itself to a state banking system, through reincorporation. Accordingly during the early part of the year 1914 there was constant discussion of the wisdom or the unwise step of declining to accept membership. The result was a
practically unanimous determination to take stock in the new Federal Reserve banks. The principal points at which the new Act immediately touched the national banks were in connexion with the contribution of capital and the transfer of their reserves. In the course of the discussion of the Federal Reserve Act there had been an effort on the part of the national banks (especially after membership in the system had been made compulsory) to reduce the required amount of contribution to the capital stock of the Federal Reserve banks to as low a level as possible. It was eventually fixed at 3% of the capital and surplus of each national bank, so that when the banks eventually entered the system (as all except some eight or ten finally did) they were obliged to pay in only about $30,000,000. In the same way they had endeavoured to avoid the necessity of transferring and retaining reserves to the Federal Reserve banks, except as they might elect, but had not entirely succeeded, although a three-year period was finally provided during which the transfers might be made in instalments, and only part of the reserves was even eventually to be transferred. At the outset the banks paid over to the Federal Reserve banks only about $18,000,000 of capital and $227,000,000 of reserve deposits. These payments were made during the month of Nov. 1914 and, as just shown, were only about $245,000,000 in all, so that the burden of establishing the reserve system was not a particularly heavy one. In connexion with the reduction in the reserve requirements which had been made in the Federal Reserve Act (central reserve city banks being cut from 25% of reserve deposits to 15%, reserve city banks from 25% to 15% and country banks from 15% to 12%), the banks were in much better condition to take care of the needs of their customers than they were before the organization of the reserve system, even without any recourse to rediscounting. In view of the fact that European demands for American goods were considerably reduced during the first months of the war, so that industry was temporarily checked and domestic prices were lowered, bank resources were more than adequate to the needs of customers. Later, as the requirements of European countries became heavier and exports from the United States were increased, the banks entered upon a period of unusual prosperity, and the difficulty in earning dividends which they had experienced during 1915 disappeared. Credit in fact became comparatively safe, not only on account of the rapidly rising prices which greatly reduced the danger of business failure, but also because of the fact that many of the large purchases of goods in the United States made for European account were practically guaranteed by foreign Governments which at that time were in a relatively strong financial condition. The number of banks accordingly increased steadily and the capital and surplus even more markedly, as may be seen from the tables already given. What has been said in this section is intended to apply directly to the case of the national banks but holds equally true of state institutions (both banks and trust companies). All went through a somewhat parallel course of development, while the high wages and steady employment which were due to very large European purchases of goods provided a strong basis for the growth of savings. Savings deposits accordingly advanced decidely in amount. For the same reason which enabled national banks to refrain from rediscounting, state banks and trust companies were relieved of any urgent necessity to enter the Federal Reserve system. The system accordingly extended but little credit to its members up to the end of 1916, while it enlarged its membership very little outside of the national banks themselves.

The War Period.—An entirely different situation came into existence immediately upon the entry of the United States into the World War in April 1917. There had already been some growth of re-discounting during the earlier months of that year, and Congress after the opening of the war, June 1917, amended the Federal Reserve Act. By the terms of this new law all reserves of national banks were to be carried in Federal Reserve banks and nothing held in vault was to be counted as reserves, it being felt that such action was practically essential in order to concentrate the banking power of the country, to enlarge the lending power of the reserve banks and to relieve the members of the necessity of carrying coin in vault. At the same time it was made to discourage the payment of coin or legal-tender money to depositors, so that the banks soon passed to what was really a paper basis. The continued importations of gold strengthened the reserve bank holdings, so that there was at all times far more gold in the country than before the war. The net increase in gold holdings was fully $1,000,000,000, but gold coin had practically disappeared from common use. Congress had also provided, in the Act already referred to, for membership of state banks in the Federal system under conditions which permitted them to withdraw whenever so disposed by giving six months' notice. Partly because of this assurance of ability to retire and partly because of a feeling that the advent of war would naturally subject all banks to severe stress, while at the same time it was regarded as a matter of patriotism to render such aid to the Government as they could, a large number of institutions entered the system. These accretions to membership continued rapidly during the years 1917-8 and resulted eventually in the admission of about 1,200 state institutions. The movement into the system had a rather important effect upon the banks and trust companies that joined. They were compelled as a condition of membership to maintain reserves equal to those of the member banks already in the system, so that a process of standardizing reserves was effectively carried forward. During the years 1915-8 there had been extensive changes in state banking legislation. These changes had provided more nearly uniform reserve requirements, besides authorizing the local state banks to become members of the reserve institutions if they felt so disposed. In consequence even those banks which did not become members were in some measure adjusted to the banking situation by being subjected to more uniform requirements. A somewhat similar process was also going on in the matter of types of bank paper, the new legislation both of Congress and of the state legislatures being intended to standardize the various types. Thus the United States emerged from the war with a much more harmonious and uniform system of banking legislation than it had ever before possessed.

Change in Holdings.—The effect of the war was, however, of a very far-reaching character in its relation to the portfolios or paper holdings of the banks of the country. The method of financing the war which was chiefly resorted to by the Treasury involved heavy taxation, but it was some time before the new taxes could yield any returns and the Federal Government never obtained from that source more than about one-third of its total outlay. The other two-thirds were obtained from the banks and the public by borrowing. The public was encouraged to save and to use its savings in the purchase of Liberty Bonds, but a very large proportion of the bonds sold to the public had to be carried in part at least by means of loans obtained at banks upon paper collateralized by Government obligations. This was true of all classes of banks, both national and state, as well as of the trust companies, while the latter and the savings banks also were urged to purchase and hold as many Liberty Bonds as they could. In these ways the investments of the banks and their commercial portfolios came to types largely of paper collateralized by Government obligations. This was true not only of the paper which represented subscriptions to bonds, but also of paper which took the place of ordinary commercial borrowings. Due to the fact that many business men preferred to borrow on their own notes collateralized by Government bonds in order to get the lower rates of interest made by the banks on such notes, paper of this kind rapidly displaced ordinary evidences of indebtedness. This state of things continued until some time after the close of the war, a modification occurring in the autumn of 1919 and continuing to grow more pronounced thereafter.

New Functions of National Banks.—Prior to the adoption of the Federal Reserve Act national banks had not been allowed to perform so-called fiduciary functions, including those of acting
as guardian or trustee, registrar, fiscal agent, administrator and others. These functions had been exclusively performed by trust companies, most states following the example of the National Bank Act and drawing a sharp line of distinction between their own state banks and their trust companies. The Federal Reserve Act authorized the assumption of fiduciary powers by national banks upon permission of the Federal Reserve Board. Such permission when granted by the Board was promptly questioned in the courts, but was upheld by the Supreme Court of the United States. This export of the principle of fiduciary banking to an extension of the scope of the fiduciary functions so that national banks were shortly placed upon a basis of competitive equality with trust companies. The situation led various states to modify their laws in such a way as to permit state banks to take on fiduciary functions likewise. Thus the distinction which had previously existed between national banks, commercial state banks, and trust companies was gradually wiped out. By the end of 1920 about 1,200 national banks had been granted permission to exercise trust functions. The time has not yet been sufficiently long to permit an accurate judgment of the effect of these changes upon the general policy of fiduciary banking, the full exercise of fiduciary functions being usually a process of comparatively slow development.

Organizing for Foreign Trade.—One of the principal defects of the old national banking system was that it did not function well in connexion with foreign trade. Neither national nor state banks had been in the habit of using bankers' acceptances, which had become the standard basis of foreign business in Great Britain. This defect was remedied in the Federal Reserve Act, which authorized the making of acceptances by national banks up to an amount equal to 100% of the capital and surplus of the accepting bank (50% in the original Act confined to foreign trade, but later amended to 100% of which not to exceed 50% might be domestic acceptances). Several of the states in which banking had assumed the greatest development made a similar change in their legislation at about the same time, so that at the opening of the World War, with its great impetus to American foreign trade, the banking system, both national and state, was in position to finance business on the acceptance plan. It was seen, however, in the formulation of the Federal Reserve Act that in order to develop foreign banking successfully the use of these changes upon the general policy of fiduciary banking, the full exercise of fiduciary functions being usually a process of comparatively slow development.

Growth of a Discount Market.—The use of the acceptance function to which reference has already been made progressed comparatively slowly during the early years of the Federal Reserve system, being retarded by the various disturbing conditions attendant upon the war. The expansion of the acceptance proceeded most rapidly and reliably in connexion with foreign trade, where this type of paper speedily assumed a position of some importance. Its growth was, however, restricted as a result of the lack of branch banks maintained by American institutions in foreign countries. At the close of 1920 it was estimated by the Federal Reserve Board that the total amount of acceptances made by member banks of the system and then outstanding was probably a little under $65,000,000. The bulk of these acceptances had been made by a comparatively small number of acceptance-issuing institutions located for the most part at points whose interest carried them in considerable measure into the export trade. Some interior banks had attempted to develop the domestic acceptance, but with no great success, while the commercial, or trade, acceptance, or "domestic bill" as known in other countries, had shown but little signs of assuming importance. This was partly due to the existence of the well-known system of offering cash discounts which, if it did not originate in the United States had attained by far its greatest development there. Under the cash discount system, while invoice prices were strictly maintained, a second or reduced invoice price was offered to those who were able to make an immediate or "cash" payment within a specified number of days from the date of the invoice, while to those who preferred to enjoy the full period of credit the full face value of the
merchandise was charged. It was clear that in these circumstances, with two rates of charge, the drawing of a merchandise bill at a fixed figure would have been difficult. Hence the very slow development of what was called the trade acceptance, and trade acceptances thus created tended to become in many cases long-term accommodation paper and fell somewhat into disrepute. In the case of the bankers' acceptance, although still formally payable on demand, the rate of discount on which it had to be renewed was generally lower, and the acceptance thus had a foothold even with the best and strongest banks through the use of syndicate agreements which provided for the issuing and discounting of blocks of acceptances by groups of banks acting in common, the paper on the whole maintained its position of solvency and reliability. The chief trouble encountered in its development was early found in the fact that no genuine market existed for it and that the Federal Reserve banks had found it practically necessary to supply such a market by taking or re-discounting freely the acceptances of banks in their own districts. Had they not done so, it appeared, the acceptances would have found no buyers on many occasions and the practice of making them and financing trade by that means would have been discontinued. This tended to transfer to the portfolios or holdings of the Federal Reserve banks an unduly large proportion of the acceptances at any time in the market, while the bad habit of some banks in discounting their own acceptances deprived the paper of much of its economic virtue as a basis for dealing in commercial credit under better market conditions. It had still in 1921 to be seen how far and to what extent it would be possible to overcome these bad elements in American banking practice and to resume the dominant position of the acceptance upon the lines followed in the more advanced commercial countries of Europe.

History of Interest Rates.—After the panic of 1907 and throughout the whole pre-war period rates of interest on bank loans tended on the whole to move in the United States steadily to lower levels. A part of the decline was due to the downward trend in the rate of discount, and another to the rapid accumulation of capital and the intensity of the competition in the investment market. As had been the case with the American market throughout its whole history, the movement of interest and discount rates was by no means uniform, falls being followed by years of flatness upon the lines of many occasions shooting up above the general level, while even commercial paper and bank rates tended to fluctuate sharply at different seasons. This tendency, however, was on the whole downward, and after the financial disorders attendant upon the opening of the World War had subsided and the new Reserve banks had become thoroughly organized interest and discount rates fell to an extremely low level. This, with the aid of the accelerated demand for credit from the Federal Reserve Act, and partly the result of scarcity of business due to the opening of the war and the transition it implied from a peace to a war basis. Low rates continued to prevail practically throughout the year 1917 until the peace of 1918, when rates of interest rose to a very high level. The early rise was correspondingly marked, the United States Treasury determined upon a low rate of discount for paper at Federal Reserve institutions, such rate corresponding closely to the coupon rate upon Liberty Bonds. This rate, however, was put into effect upon the condition that a correspondingly low rate should be made by member banks to their customers. Thus the whole interest rate system of the country was “stabilized or price-fixed.” In ordinary conditions this stabilization at a low figure would have given rise to an abnormal demand for funds, but this danger was in part averted through the control of industrial operations by the "rationing" of coal and materials for industries, while the quantity of funds drawn was heavily utilized upon the demands for support. In some cities, notably New York, a majority of the banks rationed in a similar way the stockbroking and speculative commercial draw upon their funds. Such measures furnished them with a high demand for funds at a specified and relatively low rate of interest on condition that there should be no effort, to use more than this specified amount in stock speculation and that a correspondingly low rate of interest should be charged to the non-investors in order to limit the use of analogous methods. Subject to these conditions the rate of interest continued on an abnormally low level until after the war when, as seen in another connexion (see Federal Reserve Banking System, Immediately Subsequent to the War), rates of interest began to rise steeply, the discount rate at the Reserve Banks sharply advanced. Commercial rates, which had already been on the point of rising in some directions, advanced immediately. The action of the Reserve banks was to make in the main a reduction of the subsequent advance in rates, and from the opening of 1919 throughout the year 1920 there was a fairly steady advance in discount charges which brought the current charge for bank loans at the close of 1920 up to the highest point it had reached for many years. Call loan rates, although fluctuating to some extent as a result of the War, had not reached the high rate of 1920 and had been characteristic in other periods of stress. (H. P. W.)

Savings Banks.—According to the report of the comptroller for the currency for the fiscal year ending June 30, 1920, there were in the United States 620 mutual savings banks accepting deposits amounting to $5,619,017,000; there were 4,445,271 depositors with combined deposits of $5,186,845,000, an average of $4,991.14 for each depositor. On the same date the number of stock savings banks was 1,982,299 with deposits of $1,349,625,000, an average of $680.86 for each depositor. These figures exclude stock savings banks of states in which they were included with state banks; and states: namely, Delaware, Indiana, Missouri, Michigan, Minnesota, Mississippi, Nebraska, and North Dakota. In the following table, for the years 1910 to 1919 inclusive, the figures are for mutual and stock savings banks combined:

The establishment of postal savings banks was authorized by Act of Congress, approved June 25, 1910. On July 1, 1911, deposits for this experiment were opened in each of the 48 states and territories. At the close of the month deposits amounted to $60,252 and by the end of the year, 1911, deposits had risen to $116,329. In 1912 there were 17,174 post offices having deposits totaling $167,523,260; the number of depositors $65,509 with an average deposit of $2,593.88. The majority of depositors are of foreign extraction and their deposits constituted in 1920 75% of the total. The original law allowed a depositor to have to his credit a maximum sum of $500; on May 18, 1916 this was increased to $1,000; and on July 2, 1918 to $2,500.

Any person ten years old or over may make deposits. The minimum deposit is $1; but a postal savings card may be purchased for ten cents, containing nine spaces for affixing postal savings stamps, costing ten cents each, and a card when filled is accepted as a deposit of the rate of interest of United States notes. Post offices with deposits totaling $100 or more may be exchanged for postal savings bonds, issued in denominations of $20, $50, and $100, bearing interest at 2 1/2%. As savings banks pay regular interest at 4%, and postal savings accounts pay 2 1/2%, in his report for 1920, recommended an increase in interest on postal savings. According to the preliminary figures (Aug. 1921) on school savings, compiled by the American Bankers Association, covering the school year 1920-1, 236 cities reported school savings banks. There were 2,630 reporting schools; enrollment, 1,479,567; pupils participating, 666,478; average weekly deposits, $205,704; total collections for the year, $3,475,688; average saving per depositor, $5.22; withdrawals during the year, $1,390,230; average net deposit, $3.13.

**BANTOCK, GRANVILLE (1868— ), English musical composer, born in London Aug. 7, 1868, was intended for the Indian civil service and later for the career of a chemical engineer, but abandoned both for music; he entered the Royal Academy of Music in 1889. There he gained many prizes and was the first holder of the Macfarren scholarship. In 1893 he founded the New Quarterly Musical Review, a pioneer publication in the United States. During his stay in America he also ran as conductor of the American and Australia as conductor of a Gaiety company, after which, in 1897 he became musical director at the Tower, New Brighton. Three years subsequently he was elected director of the school of music at the Midland Institute, Birmingham, and in 1908 he succeeded Elgar as professor of music at Birmingham University. A prolific composer in nearly all forms, among his best known works are The Great God Pan (1903); Omar Khayyam (1906); Pierrot of the Minute (1908); the truly choral symphony Atlantia in Caledon (1912); Fijine at the
Fair (1912); and the fine Hebridean Symphony (1916) for the publication of which the Carnegie Trust made themselves responsible. His great choral symphonies, for instance, Atlantis, a colossal work for unaccompanied choirs, occupying about 45 minutes in performance, and its companion, Vostok of Volition (1914), are remarkable examples of his. Bantock was largely instrumental in establishing the Birmingham compostition festivals in 1912 and in increasing their efficiency.

BARCLAY, FLORENCE LOUISA (1852-1921), English novelist, was born at Limpsfield, Surrey, Dec. 2 1852, the daughter of the Rev. Charles Charlesworth, rector of the parish, and niece of Maria Louisa Charlesworth, author of Ministering Children. On March 10 1851 she married the Rev. Charles Barclay, vicar of Little Acre, Herts. Her first novel, The Wheels of Time, appeared in 1858, but she is best known by its successor, The Rosary (1860), which reached a circulation of close on a million copies and was translated into many languages. The combination of religious feeling and strong love interest which characterized most of her novels appealed to a very wide public, and she enjoyed for some years an immense popularity, the total circulation of her books exceeding 2,500,000. Later novels included The Mistress of Shanestone (1910), specially filmed in America; The Following of the Star (1911); The Broken Halo (1913); In Hoc Vincit (1913); Returned Empty (1920). She died at Limpsfield March 10 1921.

BARING, MAURICE (1874-1936), English diplomat and man of letters, published Notions of the First Lord of the Admiralty (1899), was born in London April 27 1874. Educated at Eton and Trinity College, Cambridge, he entered the diplomatic service in 1898, but resigned in 1904. Taking to literature and journalism, he acted also at various times as a war correspondent for The Times and for the Morning Post; but he cultivated belles lettres for the most part, and his poems and essays soon gained high critical approval. During the World War he worked on the staff of the R.F.C. in France and also at home. In addition to various volumes of imaginative literature—poems, parodies and critical essays—he published several collections of short stories. For example: In Another Polish Room (1913); What I Saw in Russia (1913); The Mainsprings of Russia (1914), etc. In 1920 he also published R.F.C.H.Q. 1914-18, an account of his experiences in France.

BARKER, SIR JOHN, 1st BART. (1840-1914), British merchant, was born at Loose, near Maidstone April 5 1840. He was the son of Joseph Barker, a brewer, and founded the firm of John Barker & Co., Ltd., linen-drapers of Kensington, having previously been associated with the fortunes of Whittete's, Westbourne Grove. He entered the House of Commons for Maidstone in 1868 but was unseated on petition. From 1890-10 he represented Penryn and Falmouth. In 1908 he was created a baronet. He took great interest in agriculture and did a good deal for horse-breeding. He died at Bishop's Stortford Dec. 16 1914.

BARNABY, SIR NATHANIEL (1829-1915), British naval architect, was born at Chatham in 1829, his father being a member of a family of shipwrights who for several generations had served in the royal dockyards. He was entered as an apprentice to his father's trade at the age of 14, and in 1848 won an admiralcy scholarship to the Portsmouth school of naval engineering. In 1850 he was appointed a draughtsman in the royal dockyard at Woolwich (1852), passing later to the constructive department at the Admiralty and becoming its head in 1876. Two years later he was appointed Chief Naval Architect, a title changed in 1875 to Director of Naval Construction. His work in that capacity is described in 24,894-5. On his retirement in 1885 he was created K.C.B. He died at Lewisham June 15 1915.

He wrote the articles Navy and Shipbuilding for the E.B., 9th ed., and published of the 18th Century and other works on naval construction, as well as Christmas 1862 in Connaught a Study of the Irish Question (1893), and a collection of hymns, Songs by the Way.

BARNARD, GEORGE GREY (1863—), American sculptor (see 3.410), finished the Pennsylvania State Capitol group in 1911, and the pediments of the New York Public Library in 1914. His bronze statue of Lincoln, heroic in size, was unveiled in Cincinnati in 1917, and was highly praised by many admirers of Lincoln (e.g. by Miss Tarbell, his biographer, and by Theodore Roosevelt), but was called a caricature by many art critics. Mr. Robert Lincoln announced his intention, to the proposed setting-up of replicas in London and Paris, and the council of the National Academy of Design issued an informal call. A replica was unveiled at Manchester, England, in 1919.

BARNES, GEORGE NICOLL (1859— ), British Labour politician, was born at Lochie, Scotland, Jan. 2 1859. For many years he worked as an engineer, and in 1892 was appointed assistant secretary of the Amalgamated Society of Engineers, becoming its general secretary in 1896. In 1903 he went with the Mostly educational commission to the United States. In 1893 he had unsuccessfully contested Rochdale, but in 1906 was elected as Labour member for the Blackfriars (now Gorbals) division of Glasgow, where he defeated Mr. Bonar Law. This seat he retained in the general elections of 1910 and 1918. On Mr. Lloyd George's accession to power in 1916, Mr. Barnes joined his ministry as Minister of Pensions, and the same year was sworn of the Privy Council as representative of Labour, succeeding Mr. Arthur Henderson. In 1918 when the Labour party left the Coalition Mr. Barnes contested Gorbals, but was unsuccessful. Mr. Barnes was at the Peace Conference at Paris as a Labour representative, and afterwards attended the International Labour Conference at Washington. He resigned in Jan. 1920 from the Cabinet.

BARNETT, JOHN FRANCIS (1837-1916), English musical composer (see 3.414), died in London Nov. 24 1916.

BARNETT, SAMUEL AUGUSTUS (1844-1913), English divine and social reformer (see 3.414), died at Hove June 17 1913.

See Life by Mrs. Barnett (1919).

BARR, AMELIA EDITH (1821-1919), author, was born at Ulverston, Lancs., England, March 29 1821. She was educated at the Glasgow, Scotland, high school. She married Robert Barr in 1850 and four years later they emigrated to Texas. Here, in 1867, she lost her husband and three sons through yellow fever. In 1869 she removed with her three daughters to New York where she wrote for the Christian Union and other periodicals. She continued to write unceasingly until 86 years of age, publishing altogether some 75 novels. She died in New York City, March 10 1919.

Her works include the following: Romance and Reality (1872); Jan Yedder's Wife (1883); A Bee of Orange Ribbon (1886); A Border Shepherdess (1887); Remember the Alamo (1891); Prisoners of Conscience (1897); Master of His Fate (1901); The Reconstructed Marriage (1910); Playing with Fire (1914); Measure of a Man (1915); The Winning of Lucia (1915); Profit and Loss (1916); Joan (1916); and An Orkney Maid (1917).

BARR, ROBERT (1850-1912), British novelist, was born at Glasgow Sept. 16 1850 and taken to Canada when four years old. He was educated at the Normal school, Toronto, and became headmaster of the public school of Windsor, Ont., until 1876, when he joined the editorial staff of the Detroit Free Press. He had an adventurous career as a journalist for five years, and in 1881 came to England. In 1892 he started the Idler together with Mr. Jerome K. Jerome. He published a number of novels and short stories, among which being The Muttable Many (1897); Countess Tekla (1899) and The Street Maker (1910). He died at Woldingham, Surrey, Oct. 21 1912.

BARRACKS AND HUTMENTS, GREAT BRITAIN (see 3.427).

The earlier article brought the account of this branch of military administration up to about 1904. It showed the principles on which British barrack design was based (viz: on the "Barrack Synopses" and Standard Plans) and the provision which had been authorized in such matters as the numbers in one room, provision of dining-rooms and baths and other sanitary services, in the British army at home and in India. It mentioned...
BARRACKS

that in 1904 an architectural branch had been formed at the War Office, under civil control, for new barracks and hospitals at home stations; while services of a minor nature at home, and all services abroad, were carried out as heretofore, under the Royal Engineers. It remains here to show, as a sequel, how the "steady rifle" attitude indicated in the preceding paper, which was published in 1904, was continued in the following decade, until, in the period of the great World War, the civil branch ceased to exist. During that decade many new works were carried out, some of them by the new civilian architects, and others by military engineers. Broadly speaking, those carried out under the former administration were of a substantial and permanent type, while the latter constructed those of a less solid and less ornament character, applicable to the exigencies of locality.

It is necessary, however, first to mention one important development of administration which has reference to this among other subjects affecting the soldier's well-being. In 1906 a Medical Advisory Board was instituted, consisting not only of eminent military medical officers, but also of distinguished medical men in civil life, the very best expert opinion in England on sanitary questions of all sorts. With them was associated an engineer officer of high rank. To this Board was referred all designs for barracks and hospitals at home and in foreign stations other than India, and their authority on all questions affecting housing was necessary before schemes could be sanctioned. They selected or approved all sites for dwellings—whether for barracks, married men's quarters, or hospitals—and they were in charge of the Synopses of Standard Plans. During the war their functions were carried out by an Army Sanitary Committee, which, under the chairmanship of an officer of high rank, made frequent tours in the theatre of war and in all huddled camps, etc., in Great Britain.

Permanent barracks.—The principal permanent British barracks (using their term to distinguish the type from those of "light construction") which were built during the decade 1904-14, were those for one battalion of infantry and one regiment of cavalry, near Edinburgh, at Redford.

The plan of the barracks building forms three sides of a quadrangle, and the buildings are three storeys high. The ground floors are occupied with recreation and games' rooms on a generous scale, a sergeants' mess, regimental offices and shops, and other accessories, while the upper floors are used for the men's dormitories, and are divided up so that each man has a cubicle to himself. The dining-rooms and cook-houses, etc., occupy the space in the interior of the quadrangle. The whole scheme was on a scale of generosity far beyond anything to construct to a scheme of scientific economy. But the advantages gained by such treatment of design have to be weighed against the disadvantages, viz.:—the extra expense for housing even one unit, amounting to about 80% over the "light" improved type of barracks, taken to build, which was also proportionately greater. It is also doubtful whether the arrangement of having the dormitories available for night use only—as was the intention—is as satisfactory from the point of view of military administration as the system, which it had superseded, of having men living together in groups of 10 or 12 with the intimacies and comradeship thus entailed.

At the Redford barracks the officers' quarters are in a separate block, together with the men's the whole forming a handsome building, and the married men's quarters are also separate.

Light-construction barracks.—About 1905-7 proposals were made to the Army Council of a somewhat novel principle in constructional work. Hitherto it had been always accepted as an axiom in military buildings that the more substantial and permanent the construction, the better, on the ground that although the first cost might be greater than that of a temporary building, such as a wooden hut, the cost of repairs for the latter worked out at so much higher a figure and the life of the building was so much shorter, that it was true economy in the end to build solid and substantial. The converse of this principle, which could be a technical and economic alternative, was that a very temporary building might be as solid as is possible. The cost of erecting a barracks designed to be a temporary building but built of brick, might be between 0-75 and 1-25% of the capital value, but that of huts might run to 3 or 4%. It was pointed out in 1907, however, that this was a fallacious argument to apply to buildings which were required for a service subject both to frequent changes of policy and to changes of standard imposed by progress in science. Thus the Royal barracks in Dublin, which in the reign of Queen Anne were considered the finest in Europe, were in the reign of Queen Victoria still standing, solid and substantial, but the despair of every sanitary expert. The same applies to many barracks (and, it may be added, to many civil hospitals) in many parts of the British Empire. It was argued, therefore, that this constructional science had now reached a point where it was possible to build in a manner much less expensive, much more rapidly erected, and much more easily altered than the solid walls and heavy roofs of our fathers, and that such buildings, not much more expensive than temporary huts, could be made to suit military needs; and that the cost of maintenance would be no greater than that entailed in the case of more substantial works. Any one acquainted with the routine of military administration is familiar with the constant "reappropriations" that have to be made to suit some change in the requirements of accommodation. A row of married men's quarters has to be turned into a temporary, or even permanent, hospital, or a forgey barn has to be made into a school, a gun-shed into a recreation room. With solid old masonry this became a serious and expensive matter. The whole subject required reconsideration.

Just then an opportunity occurred of making the experiment on a fairly wide scale. In the earthquake at Kingston, Jamaica, civil and military houses alike were shattered in a few seconds. The barracks, for about 300 men, with church, hospital and all administrative offices and staff quarters, had been of the old solid type. They were gone, and had to be replaced at once. Urgent representations to England pointed out that remedial measures must be instant, that there was neither material nor labour available locally, and that new plans should be proof against earthquakes and hurricanes.

It was decided at once to build the new barracks with a skeleton steel framework, vertical steel stanchions, braced below by steel horizontal joists, and above by a composite steel and wooden truss. The stanchions were rooted, as it were, by a broad flat plate, in a concrete block in the ground, and they were calculated to carry the whole weight of floors, walls, roof and any other contingent matters such as windows, doors, shelves, etc. The walls, which carried no weight, but were merely screens from weather, were composed of a double panelling of metal lathing plastered over and fastened to the steel stanchions. Being double, the space between the two sets of panels acted as a non-conductor of temperature. The whole of the work was quickly designed and the material quickly prepared. A firm of English contractors erected the skeleton of each building on their own premises, marked every part on a key plan, and the whole was dispatched from Bristol under charge of an experienced foreman. The erection of the first barrack, under a selected officer had meantime been dispatched, soon after the disaster, to erect the first building and arrange preliminaries for the others.
shortly after the work was finished (not so serious, however, as the original one), and the buildings were quite unaffected.

The barracks were rapidly erected. Although all the materials, except the roof-covering and the ballast for the concrete, were sent from England, the troops were in occupation of their new quarters in Nov. 1907, ten months after the earthquake, and

the universal opinion was expressed that the new barracks which cost £77,000 were a great improvement in comfort and convenience on the old ones which had cost, in days when building was relatively cheap, £35,000.

So far, then, the principle of light construction had been justified, but it did not follow that a type which was suitable to a hot climate like that of the West Indies would be equally applicable to Great Britain. At that time, however (1908), a small barrack was urgently required at Bordon, near Aldershot, for a field company of R.E. 150 men, with some accessory buildings such as sergeants' mess, recreation rooms, stables, etc., the estimated cost of which in "permanent" construction was £16,000; in "light construction" the estimate was £9,000, and this sum was sanctioned, and the work was carried out within the time estimate.

The barracks were rapidly erected. Although all the materials, except the roof-covering and the ballast for the concrete, were sent from England, the troops were in occupation of their new quarters in Nov. 1907, ten months after the earthquake, and

etc. It was found that the building was warm and airy, and that the cost of maintenance was at least not greater than would have been the case with permanent construction. While the saving in cost lay mainly in walls and foundations, endeavour was made at the same time, by using some of the modern types of light roof-covering, to effect saving in the roof timbers. With all these economies in design there was a substantial reduction in cost, especially in the case of those military buildings where the walls and roof formed a large part of the whole. Thus stables, which had formerly cost about £60 per horse, were built on the new principle for about £32 to £35, without any reduction of efficiency. Figs. 7 and 8 show the exterior and interior of such a stable and indicate the general style of building. A large riding-school built at Netheravon, Salisbury Plain, which was constructed on the "light-construction" principle, cost less than 2d. per cuh. ft. as against 6d. to 7d. for a riding-school on the "permanent" principle. This is no doubt the most conspicuous example of saving in relative cost, as the building consists of little else than walls and roof.

Barracks on this principle, some of them double-storied, were built with satisfactory results at places far distant from one another as Jersey, Worcester and Glasgow.

Another administrative change about this period also affected the design of important auxiliary buildings. Up to about 1909 it was laid down that the regimental institute (coffee bar, recreation room, etc.) should be separate from the "wet" canteen, for malt liquor only and also from the dining-rooms. In 1909, however, it was decided that, in any new construction, the wet canteen should be abolished, being replaced by a liquor bar in the institute, that there should be no restriction to the moderate use of malt liquor in connection with food, but that there should be no place for the sale of liquor only. The effect of this amalgamation of the institute and canteen was extended, where circumstances made it possible, to the amalgamation of the dining-rooms and supper bar, the men thus having all their meals served in the same room but with separate kitchens, one dealing with the regulation rations, and the other with the varied forms of refreshment purchased by the soldier voluntarily.

This new departure was first embodied in the R.E. barracks at Bordon, and there found to be so satisfactory that it was followed in the new barracks at St. Peters, Jersey, where the combined dining and recreation rooms were made overlooking a cricket ground, with a large veranda forming a pleasant position for spectators of the game. It was possible, by the economies afforded by the light construction principle, to give these improvements without excessive
cost, more especially as there was substantial saving in having the three buildings, canteen, institute and dining-rooms, combined in one.

As the light-construction principle became more established in factories, including hospitals, in country districts especially, designs were contemplated for larger schemes, i.e., for the cavalry brigade barracks at Chiseldon, Wilts., and for an artillery brigade barracks near Fermoy, at the time of the outbreak of the war, and were in part carried out. In 1912-13, this principle of design was mainly adopted in connexion with aviation buildings, required by the new R.F.C. The variety of new buildings, aero-plane sheds, workshops, instructional buildings, etc., that were involved, was great, and the urgency for their provision was pressing. A system of construction, therefore, which would lend itself to quick completion, not involve heavy expenditure, and be capable of expansion was obviously suited to a service of which the full requirements were still conjectural.

Allusion may be made to one particular development, for it applied to other branches of the service as well as to aviation. This was the construction of officers' messes and quarters. Hilborn's permanent barracks everywhere, these had been combined in one continuous building, and, when enlargement or alteration of the mess became necessary, the problem was difficult. With the new arrangement for the R.F.C., the mess-house was designed separately, generally built on a site fairly central for groups of officers' cottages erected near it. Each cottage contained rooms for four single officers or two bold officers, with an annex behind, containing servants' rooms, store-rooms, bath-rooms, etc. If the establishment of officers increased, more cottages could be built; if the numbers were reduced, one or more buildings could be shut up or reappropriated. This form of accommodation was very popular.

Married Soldiers' Quarters.—Accommodation for the married soldier had in earlier years been brought to a reasonable standard of comfort and decency. The standard plans of married quarters, however, were neither economical in first cost nor pleasant in appearance. Frequently built in long and monotonous rows, they resembled the mean streets of an industrial town, and occupying, as they often did, a lonely spot in rural England, they were an eyesore and reproach. Hence, during the decade 1903-14, much attention was paid to (a) reduction in cost, and (b) improvement in external treatment. As regards (a) the average cost of the standard design was £200 per quarter of four rooms, and it was found by rearrangement in constructive details, reducing height of rooms, rearrangement of chimneys, etc., the price could be reduced to about £200—£250 without sacrifice of comfort or authorized accommodation. Attention to (b) was possible also, in the arrangement with economy: and the grouping of rows of quarters round gardens, playgrounds, etc., gave an impression of home life in country districts. Some groups of such cottages at Farnborough, Hants., were visited in 1917 by the Local Government Board Committee on the National Housing Problem, and elicited their full approbation.

Hutting during the War.—When accommodation for the new armies first came to be considered by the British War Office in the first 10 days of the World War, it was definitely decided to adopt some cheap design of hut which could be readily erected, and also easily adapted to any form of temporary material and to any reasonably level site. But there were many other considerations, what barrack accommodation should be, in view especially of recent rules regarding dining and recreation rooms, what sort of sanitary provision should be made, what method of lighting should be adopted, etc. As a result of consultation between the various War Office departments concerned the following points were settled: (a) That huts to hold 25 men (including one sergeant) should be constructed, giving 48 sq. ft. floor area per man (about 400 cub. ft. of interior space); (b) that there should be two principal spans of huts, viz. 20 ft. and 28 ft., and that as far as possible all the various buildings should be planned to fit one or other of these, so as to simplify the construction; thus, men's barracks, officers' quarters, regimental offices, etc., could be combined, mess and ante-room and kitchen, for example, were all planned to fit the 20-ft. span, while men's dining-rooms, cook-house and regimental institute were on the 28-ft. span; (c) that there should be a battalion cook-house, fitted with the best known pattern of cooking-range and boilers for 1,000 men, and that there should be on either side of it dining-rooms for 500 men each, allowing 5½ to 6 sq. ft. for each man on a total floor space of 2,500 sq. ft. Between the cook-house and the dining-rooms there should be sculleries; (d) that there should be in each hut a bath-house with a central heating boiler and hot and cold water laid on to the showers, which should be in the proportion of 5 to every 100 men; (e) that there should be a regimental institute of three rooms, viz. supper room, games room, and corporals' room; the bar and beer cellar to be between the supper room and corporals' room so that central serving could be arranged. There was also provided a kitchen and scullery for a block of mess-room and ante-room joined by a short passage with a kitchen block; (f) that four drying-rooms should be provided in which wet clothing could be hung, fitted with stoves etc.; (g) that the privies should be in the dry-earth system, and that the ablution rooms and urinals should either lead into soak pits (in the chalk country in France this was invariably done) or into sewage filters; (i) that the lighting should be done by electric lamps and the wires carried on poles, not buried.

not in accordance with the original intention; (f) that there should be officers' and sergeants' messes planned to accommodate 30 officers and 50 sergeants respectively, and consisting of one block with mess-room and ante-room joined by a short passage with a kitchen block; (g) that four drying-rooms should be provided in which wet clothing could be hung, fitted with stoves etc.; (h) that the privies should be in the dry-earth system, and that the ablution rooms and urinals should either lead into soak pits (in the chalk country in France this was invariably done) or into sewage filters; (i) that the lighting should be done by electric lamps and the wires carried on poles, not buried.

Plans of the principal huts designed on the above decisions are shown in figs. 9 to 12.

That these points were speedily settled is proved by the fact that all the type plans in detail for a complete battalion camp were approved 10 days after war was declared, and three days after it was decided to raise 100,000 men for the new army.

Considering the urgency of the matter, it would not have been a matter for surprise if extensive changes had to be made after the outbreak, and that the scheme should be adapted to the dry-earth system, and that the ablution rooms and urinals should either lead into soak pits (in the chalk country in France this was invariably done) or into sewage filters; (i) that the lighting should be done by electric lamps and the wires carried on poles, not buried.

As regards materials, the huts were first founded on brick piers. This was a mistake, and it would have been better from the outset to
have had a short stout pile of creosoted wood. The brick piers involved bricklayers and bricks and mortar, and the provision of these meant delay in some cases. The framework of walls, roofs and floors was mainly red fir of market scantlings, but the multiplication of these scantlings caused a famine in the market and much complaint. Yet it is hard to see how this could have been avoided, except by using a material more costly, or else by taking more time in construction. A light steel framework was used in some cases, with expanded metal plastered on one side, and sheet iron painted in the interior of the room, but this was costly compared to timber. For lining match-boring and 3-ply timber were used. Asbestos sheets were used at first but were found very brittle unless the backing of timbers was fairly (say 18 in.) close, and "S X boarding" and similar fibrous matter was also employed, but not found suitable.

In France excellent sectional huts were made up by French workmen, and the carpentry was somewhat on different lines to that employed in England, lighter scantlings in roots and subsidiary ties and struts being used. Many of the sectional huts had the sides at a slight angle to the vertical, the sloping side forming like a "mainard" roof, part of the truss supporting the roof-covering.

*Hospitals.*—It was pointed out in the earlier article that military hospitals, where built permanently, are designed on much the same lines as those in civil life.

During the decade before the World War there were two large permanent hospitals built for military needs, at Portsmouth and Dublin, but there were many small "reception stations" for examination, observation, accidents, etc., and one fairly big hospital for women, built of light construction, and found to be most satisfactory in every way.

When the war broke out in 1914 the whole question of suitable hospital design came necessarily into great prominence, and the following were the main points which were then settled:—

(a) The wards should contain 25 beds, i.e. 24 ordinary duty rooms and one special case in a separate small room; (b) the nurse's duty room should be adjacent to the entrance to the main ward, divided by the central passage from the special-case ward; (c) beyond the nurse's duty room should be the ward scullery and on the opposite side of the central passage the linen cupboard; (d) beyond this a transverse passage so as to give clear ventilation between the foregoing parts of the ward and the ablution and bath-rooms, which come then at the end of the hut nearest to the main entrance.

This gives a hut 140 ft. long by 20 ft. 8 in. wide (see fig. 13). Of the total area a little more than one-fourth is taken up by accessory accommodation, and it is doubtful whether as much as one case out of 24 requires to be specially treated. However, the above represented what may be called the nucleus typical ward, and hundreds were erected either exactly the same as this or with minor modifications, both in England at the large training-centres, and in France in the area occupied by British troops.

The administrative offices, which are always an important adjunct in a hospital, were combined in a hut 160 ft. by 28 ft., shown in fig. 14. At one end is the out-patient department with consulting-room, waiting-room and dispensary, divided by a corridor from the offices of the principal medical officer, his clerks and registrars, beyond which are the offices of the matron, nursing sisters' duty room, and clinical laboratory. At the rear of these are the orderly medical officers' room and the medical board room.

In the field there was in some cases a reception block where all wounded cases were brought, given temporary treatment, food, etc., and examined by the medical officers prior to being sent to one or other of the special wards for surgical attention, etc.

In a typical operation hut, 15 ft. by 36 ft., a wide double door, to admit a stretcher, leads into a hall, from which open on one side a Röntgen-ray room, an anaesthetic room, and the operation room, while on the other side are the sterilizing-rooms, preparation room, store and photographic rooms. The patient, after X-ray examination, is taken into anaesthetic room and thence, when unconscious, into the operation room, about 20 ft. square, with windows opening to the north.

The hospital arrangements in the field varied in some nature of detail, but the same general principles were followed.

Hospital kitchens were based on the knowledge that, while some patients could come to a dining-room, there were many who would
have to be fed in their beds, and that the diets would have to be varied to suit individuals. The cooking and distribution arrangements made for the sick would also have to be on a more elaborate plan than is provided for in ordinary barracks.

Other hospital buildings, such as dining-room, supply stores (for barbers, carpenters, and blacksmiths), offices, and sanitary accommodation, and barrack huts for orderlies, followed the usual lines for ordinary barrack huts and quarters with certain modifications. There were, however, two other adjuncts of importance in the new hospital building, the mortuary block, and the dissecting block, which deserve a brief description.

The former is a hut 30 ft. by 14 ft. 8 in., with a post-mortem chamber 14 ft. by 11 ft. 9 in. at one end, fitted with tables, coverings, and cupboards. Next to it is the body chamber, about 8 ft. square, and beyond that a "viewing chamber," entered by a separate lobby where friends of the deceased could view the corpse prior to burial.

The dissecting-hut has a receiving-room 11 ft. 9 in. by 14 ft., into which the foul clothing, bedding, etc., is brought, and placed in an air-tight disinfector, one end of which opens into the receiving-room, and the other into an adjacent chamber, the issuing-room, whence, after treatment in the disinfector, the material is removed. There is a small incinerator in another chamber, and, for those materials which require liquid disinfectants, there are other rooms provided.

**Portable Huts of Special Design.**—There were many types of portable huts used, of which the most permanent and efficient proved to be satisfactory for prolonged use, although many were found very useful for rapid work and in emergencies. The principles were the same in most cases, viz. framing of wooden scantlings about 2 in. by 1½ in., covered with canvas prepared with some sort of waterproof solution, and, when unfolded, fixed in position by light bolts or by hooks. The disadvantages were that they did not afford protection against cold and heat than tents, and that the edges of the framing caused the parts of the canvas in contact with them to wear rapidly.

Portable huts of corrugated steel bent to a circular form were, however, most useful. The most improved by Lt.-Col. Nissen, R.E., was largely used in the field. These huts were very similar to one another only in the fact that in the larger one there was a central ridge opening admitting air and light along the summit about 30 ft. long, that was divided into two sections by the use of H-section bent in a semi-circular form, and resting on plates for foundations. Over these, corrugated steel in three parts, clipped together at the edges, and fastened to the ribs, is laid. Under the corrugated steel, and fitting into the flanges of the ribs, are light boards to form a lining. The floors, of wood, are made in sections and fit in between the parts of the steel framing that reach the ground. At the ends of the huts are doors and windows, with matchboarding to fill the unoccupied spaces. Thus the corrugated steel covering forms roof and walls, while light and ventilation, etc., is obtained from each end. The great advantage of these huts was that their area could be increased as far as it was desired, and, as such, was much required for other services, it was difficult to get supplies of these huts in large numbers.

The tent-like huts, either of the pattern alluded to above, or of some modification of the Nissen patent, will be considered as articles of recognized equipment in future and kept in store.

**United States.**

In times of peace the provision and upkeep of quarters for U.S. troops had been the function of the Construction and Repair Division of the quartermaster-general's office. The permanent military posts were equipped for quarters in the army housing for any number of men. Upon America's entrance into the World War the subsequent drafting of large numbers of men demanded an unprecedented activity, of course, existing quarters were wholly inadequate. As authorized by a letter of the adjutant-general, May 19, 1917, a separate Cantonment Division was created in the office of the quartermaster-general, reporting directly to the Secretary of War, and charged with the formulative task of housing the new army. On Oct. 19, 1917, the old Construction and Repair Division was abolished and its duties given to the new organization, which in Feb. 1918 was placed under the direction of Chief of the new office of chief-of-staff. It was thus detached from the office of the quartermaster-general as an independent service. On March 13 1918 its name was changed to the Construction Division.

On the 1st of May, 1918, the Adjutant-general assigned to the quartermaster-general's office the temporary duties of managing and housing the troops. The commanding generals of the different military departments were ordered to select 16 sites for the erection of cantonments (National Army Cantonments) to receive the troops to be chosen by the selective draft. The lot was to be divided equally among the National Guard and the regular army. (National Guard Camps). Already in April tentative plans had been drawn for barracks and mess-halls, these to be wooden structures one story in height, 20 ft. wide and of varying length, and this type was used for certain buildings in the National Guard Camps, although other houses, however, were used. The cantonments were all situated in the southern states, and required less protection against cold. Actual construction of cantonments began late in June and of camps about a month later. The last cantonments in the North of the United States were commenced in March, 1918, and the first cantonments for the Canadian contingents at Quebec were prepared in May. The first camp was occupied Oct. 19, 1917 and subsequently expanded to 7,000,000. The National Guard camps provided quarters for 450,000 officers and men. At the regular camps the number was increased to about 1,700,000, additional men. The programme of construction included also 4 centres of embarkation, 22 special camps, 30 supply depots and numerous other establishments. At the Armistice, Nov. 11, 1918, the number of all such establishments in the United States was more than 1,700,000 troops.

In laying out the cantonments on the chosen sites experts in town-planning gave advice. In general a U-shaped plan was adopted in which the wings could be extended indefinitely. In place of the general plan that had to be adapted in each case to the local terrain. Standardized basic units of construction were devised, but these of the beginning one-story quarters for the officers had been designed and accommodated. It was known that the original company of 150 men would be enlarged, but it was not known to what extent. For the 16 cantonments plans were issued calling for 2-story wooden barracks of 100 to 130 ft. wide in buildings, varying from 2 to 4 stories, for 107,340 men, or for 450,000 men, or for 500 to 600 men or less, each building to have mess-halls and barracks. In the case of the cantonments in the northern part of the United States, the barracks were lined with wall-board, with interior woodwork, the cold; in the latter, they were merely double-boarding on the outside. Enclosed stables were built in the North, open stables for animals of the South. As originally designed these barracks proved provided for an air-space of about 600 or 400 cubic feet of fresh work, then in force for tent quarters. In Sept. 1917, after construction was almost finished, orders were issued calling for at least 500 cub. ft. of air space per man in both wooden barracks and in tents. At the same time it was ordered that the upper stories were to be increased to 250 men. It was further ordered that not more than 35 men should be housed in one room and that each room should have four outside windows with walls and should have an independent air-space of about 250 cub. ft. This requirement for better air in the interiors and much additional construction so that one company could be quartered in two adjacent buildings. For subsequent construction where the barracks were to be provided with as large a maximum of 50 by 60 ft., 2-stories high, with accommodations for 66 men. For a single company four such barracks were required, besides separate buildings for mess-halls and laundries. The first battalion was ten rooms, and the other therefore by the problem,was the construction of all the necessary buildings, for 44,000 in 6 months. The Army Corps of Engineers, the Construction Division, the electrical and civil works, and the Army medical and dental corps were engaged in this work, and under the direction of the Adjutant-general the work was completed on time. The buildings were then presented to the troops.

All the buildings at the cantonments, both mess-halls and barracks, were built by the private companies and were, so far as possible, of standardized design. The prefabricated buildings were shipped to the various cantonments, and were set up without any laborious work. The prefabricated buildings were shipped to the various cantonments, and were set up without any laborious work.
thorough 22 ft. long; a storage tank of 560 gal. capacity attached to a heater supplied abundant hot water. Where possible the sewage was discharged directly into running streams; where desirable, septic tanks were installed. The water was usually 18 ft. in some cases, 24. Such walks as were built were usually of wood.

Tables I. and II., from official reports of the War Department, give the name and location of each cantonment and camp, the number of buildings erected and the amounts allotted for construction (from July 1, 1917 to June 30, 1918 inclusive):

BARRÉS, MAURICE (1862— ), French novelist and politician (see 3,434), published La Colline inspirée (1913); but after 1914 was occupied almost exclusively with subjects arising out of the World War. La grande Pitié des Églises Françaises (1914); L'Âme française et la Guerre (1915); La Lorraine dévastée (1916); Le Roman de l'Énergie nationale (1919) were among his later works. He also published literary addresses and lectures.

BARRIE, SIR JAMES MATTHEW, BART. (1860— ), British novelist and dramatist (see 3,435), devoted himself after 1910 almost exclusively to drama. He produced, amongst other plays, Rosalind (1912); The Will and The Adored One (1913); Der Tag (1914; Rosy Rapture (1915); A Kiss for Cinderella (1916); Dear Bruth (1917); and Mary Rose (1920). He was created a baronet in 1913.

BARRILI, ANTONIO GIULIO (1856-1909), Italian novelist (see 3,436), died Aug. 13, 1908. His last work, a volume of poems, Canzoni al vento, was published posthumously in 1911.

BARRINGTON, RUTLAND [GEORGE RUTLAND FLEET] (1853— ), English actor, was born at Penge, Kent, Jan. 15, 1853, and was educated at Merchant Taylors' school. He appeared first at the Olympic theatre, London, in 1874. Three years later he joined D'Oyley Carte's company at the Opera Comique and appeared in Gilbert and Sullivan's opera The Sorcerer. From that time onwards he was identified with the fortunes of the long series of these operas, which ran continuously from 1877 to 1889 and were revived at frequent intervals. In 1908 and 1911 he published two volumes of Recollections.

BARRINGTON, JOHN GEORGE (1856-1920), Scottish cartographer, was born in Edinburgh March 22, 1856, the elder son of John Bartholomew, also a cartographer (see 3,430). J. G. Bartholomew was educated at the Edinburgh high school and university, and succeeded his father as head of the business of the Edinburgh Geographical Institute. In this capacity he maintained and improved the unsurpassed reputation for scientific cartography and exquisite reproduction which the firm had already acquired; in particular, he extended and popularized the use of "layer" colours exhibiting relief of the land, applying this method not only in the reduction of ordnance survey maps but in many other instances, including general atlases, of which the finest example is that published by The Times since the close of the World War. Bartholomew was associated with Sir John Murray and others in connexion with the mapping of results of the "Challenger" expedition, the bathymetrical survey of the Scottish lochs, and other scientific studies. He planned a physical atlas on a large scale and with the cooperation of Dr. A. J. Herbertson published the Atlas of Meteorology in 1899, which at once became a standard work. The volume on zoögeography, in collaboration with W. Eagle Clarke and P. H. Grimshaw, followed in 1911. His written works include a bibliography of authoritative maps of all countries (1901) and a gazetteer of the British Isles; and he interested himself greatly in geographical education, helping to found the lecturership in geography in the university of...
Edinburgh, as well as the Royal Scottish Geographical Society. He was one of the founders, and for many years, hon. sec. of the Royal Scottish Geographical Society. He died at Cintra April 13, 1920, but the management of the Edinburgh Geographical Institute remained in his family.

**BARTHOU, LOUIS** (1862-1917), French statesman, advocate, author, journalist, and lecturer, was born at Oleron Aug. 25, 1862. He was elected to Parliament in 1889, and five years later he became Minister of Public Works. He was successively Minister of the Interior (Aug. 1896 to June 1898); Minister of Public Works (March-Oct. 1906 and in the subsequent Clemenceau Cabinet until July 1909); Minister of Justice from July 1909 until March 1913; prime minister May 22 to Dec. 2, 1917; Minister of State in the Painlevé Ministry during the World War, subsequently succeeding Ribot as Minister for Foreign Affairs; Minister of War Jan. 16, 1921. His most notable political achievement was the manner in which he pushed through the Three Years' Service Bill, which was a response to German military preparations before the war of 1914. He was elected a member of the French Academy in 1918.

**BARTON, CLARA** (1821-1912), American philanthropist (see 3:452), died at Glen Echo, Md., April 12, 1912. She is the only woman whose name has been taken by a post of the G.A.R. See Mrs. Cora Bacon Foster, Clara Barton, Humanitarian (1918), which outlines her career in extracts from records, letters, and contemporary papers.

**BARTON, SIR EDMUND** (1849-1920), Australian statesman and judge, was born at Sydney, N.S.W., Jan. 18, 1849. He was educated at the Sydney grammar school and the university of Sydney, where he won many distinctions, and was called to the N.S.W. bar in 1871, becoming Q.C. in 1889. At the age of 30 he entered the N.S.W. Legislature as representative for Sydney University, and remained a member of either the Assembly or the Legislative Council for many years. During 1883-7 he was Speaker of the Assembly and in 1885 and again in 1898 he was for a time Attorney General. In 1889, after the death of Sir Henry Parkes, he became senior representative for N.S.W. to the Federal Convention. He was a keen supporter of Federation and in 1900 led the delegation sent to London with the Australian Commonwealth bill. In 1901 he became the first Prime Minister of federated Australia, holding also the portfolio of External Affairs. His two years of office were much troubled by party strife. He had been a lifelong supporter of Preference, but his majority over Sir George Reid and the Free Traders was small and the Labour party held the balance. In 1903 he was glad to resign office and accept the appointment of Senior Puine Judge of the High Court of Australia. In 1901 he was sworn of the Privy Council and in 1902 he was created G.C.M.G. He died suddenly at Medlow Bath, near Sydney, Jan. 6, 1920. Known affectionately as the "Father of Australia," Edmund Barton inspired through his long career as a politician a deep personal devotion. His magnificent talents were used more for the advancement of his ideals and the help of his friends than in the service of his personal ambitions. Like a genial Dr. Johnson in conversation, he made easy captives of British statesmen on his visits to London. One of his sons was the first Rhodes scholar from N.S.W. to Oxford.

**BARUCH, BERNARD MANNES** (1870-1960), American financier, was born in Camden, S.C., Aug. 19, 1870. He graduated from the College of the City of New York in 1889. For many years he was a member of the New York Stock Exchange but sold his seat in 1917. He first came into national prominence when appointed by President Wilson as a member of the advisory committee of the Council of National Defense in 1916, and after America's entrance into the World War he held many important positions. He was chairman of the Committee on Raw Materials, Minerals and Metals, and was in charge of purchases by the War Industries Board. He was also appointed a member of the commission in charge of all purchases made for the Allies. He became chairman of the War Industries Board in 1918 but resigned at the close of the year. In 1919 he was a member of the Supreme Economic Council of the Peace Conference in Paris and in the same year was appointed by President Wilson as a member of the Industrial Conference in Washington. He wrote The Making of the Reparation and Economic Sections of the Treaty (1920).

**BASCOM, JOHN** (1827-1911), American educationist and philosophical writer (see 3:458), died Oct. 3, 1911 at Williamstown, Mass.

**BASELL, WILLIAM** (1826-1895), British ethnologist (see 3:459), died in 1895.

**BATILLE, FÉLIX HENRY** (1872-1930), French poet and playwright, was born at Nîmes April 4, 1872, and was educated at the lycée Henri IV, at Paris and the lycée Janson de Sallly. He brought out his first play, La Belle au bois dormant, in 1894 and his first volume of poetry, La Chambre de l'écho, in 1895. His dramatic work includes Le Lépreux (1896); Ton Sang et L'Enchanteoir (1900); Le Masque and Resurrection (1902); Maman Colibri (1904); La Marche Nuptiale (1905); Poliche (1906); Les Flambeaux (1912); Le Phalèse (1913). Among his later poems may be mentioned La Divine Tragédie (1916) and La Quadrature de l'Amour (1920). Note also, in Réjanne one of her last appearances, Les Sœurs d'Amour (1919), L'Homme à la Rose (1920) and La Teendrie (1921), are among his recent successful plays.

**BATEMAN, KATE** [Mrs. CROWE] (1842-1917), American actress (see 3:508), died in London April 8, 1917. She had since 1892 conducted a school of acting, appearing only rarely on the stage; but she played Lady Kew in Colonel Newcome at His Majesty's theatre, London, in 1906, the nurse in Medea at the Savoy theatre in 1907 and Kirjpa in False Gods at His Majesty's in 1909.

**BATESON, WILLIAM** (1861-1926), British biologist, was born at Whitley Aug. 8, 1861, the son of the Rev. W. A. Bateson, some time master of St. John's College, Cambridge. He was educated at Rugby and St. John's College, Cambridge, and became famous for his biological investigations, which included important researches on Mendelism and the determination of sex. In 1894 he published Materials for the Study of Variation. In 1907 he gave the Silliman lecture at Yale University, from 1908 to 1909 was professor of biology at Cambridge, and in 1910 was appointed director of the John Innes Horticultural Institution at Merton Park, Surrey. From 1912 to 1914 he was Fullerton professor of physiology at the Royal Institution, and in 1914 was president of the British Association. He received the Darwin medal of the Royal Society, of which he was a fellow, in 1904. His other works include Mendel's Principles of Heredity (1902) and Problems of Genetics (1913), besides many short studies on biological subjects.
BAUER, GUSTAV—BAVARIA

BAUER, GUSTAV (1870— ), German Socialist, and first chancellor of the republican German Reich, was born Jan. 6 1870 at Darkehnen in East Prussia. At an early stage of his career he took up the secretarial work of the German Trades Unions movement and in 1908 became president of the general committee of the Trades Unions of Germany. Elected a member of the old Reichstag in 1912, he was appointed on Oct. 5 1918 Secretary of State for the Department of Labour in the Government of Prince Max of Baden, the last Government under the old régime.

In Feb. 1919 he was appointed Minister of Labour in the republican Government of the German Reich and on June 21 of the same year president of the Ministry which was installed to accept the Peace Treaty of Versailles. The new constitution of the Reich having been enacted, the president of the Ministry resumed, in accordance with its provisions, the old title of chancellor (Reichskanzler) and Bauer was the first to hold this office under the republican régime. He remained chancellor until the Kapp coup of March 1920, when he fled with the president of the Reich, Ebert, and the rest of the Ministry to Dresden and afterwards to most picturesque leaders of the Social Democrats of Bavaria, where he entertained the promise that the Ministry would be reconstructed and Bauer made way for the second republican chancellor, Hermann Müller, himself becoming for a brief period the Minister of the Treasury (Reichschatzminister).

BAUER, OTTO (1881— ), Austrian politician, was born Sept. 5 1881, the son of a Viennese manufacturer. He entered the faculty of jurisprudence at the university of Vienna, devoting himself especially to the study of economics, principally under Böhm-Bawerk. As a student he took an active part in the work of the Social Democratic party, and was early a zealous contributor to the Arbeiter-Zeitung. He served in the campaign of 1915 and was a prisoner of war in Russia from 1915 to 1917. After his return to Vienna he was elected a member of the committee of the Social Democratic party, and became the leader of the increasingly influential Left group. After the revolution he succeeded, in Nov. 1918, his master Viktor Adler as State Secretary for Foreign Affairs. In this capacity he energetically supported the idea of the union of German Austria with Germany. During the peace negotiations at St. Germain in July 1919 he retired from his office, but remained until Oct. a member of the Socialization Commission. He subsequently became one of the most conspicuous leaders of the Social Democratic party in the Constituent National Assembly and in the National Parliament (Nationalrat), his speeches dealing mainly with financial questions, such as the tax on capital, and foreign affairs.

His works are: Die Nationalitätenfrage und die Sozialdemokratie (1908); Die Teuerung (1911); Balkankrieg und Deutsche Weltpolitik (1912); Die russische Revolution und das europäische Problematik (1917); Bolschewismus und Sozialdemokratie (1920).

BAVARIA, a territory and free state of Germany (see 3.545).

—The pop. of Bavaria, with which Conz had voluntarily united in 1918, was, according to the census of 1919, 7,145,533; without Coburg 7,066,024, in 1910 6,887,701.

Political History, 1910–21. —The two last years of the life of the Prince-Regent Luitpold were characterized by an intensification of internal political conflicts which arose from the increasing estrangement between the Podewills Government and the majority of the Diet (Landtag) consisting of the Catholic Centre party.

In the summer of 1910 Minister of Finance von Pfaff had succeeded without much difficulty in passing an important measure of the non-socialist parties and had thus been able to introduce a general income tax in order to consolidate the financial position of the country. But the resistance with which, in the first instance, the majority of the Government, Frauendorfer, and the whole Cabinet met the demand of the Centre for the suppression of the German Railway Men's Union, on the ground of its alleged Socialist tendencies, soon led to an open conflict between the majority and the Government. On Nov. 10 the majority of the Finance Committee of the Diet refused to discuss with Frauendorfer the vote for the estimates of his department. The Government, in the hope of avoiding this conflict and relaxing the strain of the internal situation, induced the aged Regent to order the dissolution of the Diet. This was done on Nov. 14. For the elections which took place on Feb. 5 1912, the Liberal parties, the Social Democrats and the Bavarian Farmers' League (Bayerischer Bauernbund) concluded an alliance the effect of which was that only these three parties were allowed to stand for the elections against the candidate of the Centre. The Podewills Cabinet resigned on the day of the elections in order to give the Crown a free hand according to the results. These results did not fulfill expectations. The German Centre party, which under the auspices of the allies, the Conservatives, came back with much less than half their former strength. The Liberals, the Social Democrats and the Farm- ers' League gained seats, but not enough to overthrow the Clerical-Conservative majority.

The Prince-Regent entrusted the university professor, Dr. Baron von Hertling (afterwards Chancellor of the German Empire 1917–8), with the task of forming in the Reichstag a buoyant bloc of the Catholic Centre party, with the formation of a ministry. Baron von Hertling acted in the sense of his commission; he selected two of the leading members of the Centre and filled the remaining posts with politically colourless officials. The hope that the elections would have relieved the strained condition of internal politics was not at first fulfilled. On the contrary the controversy about the treatment of the South German Railway Men's Union was further embittered by the issue of an ordinance which demanded from the workers on the railways the signature of a paper certifying their loyalty; and the issue of a secret ordinance on toleration of the exercise of priestly functions by members of the Jesuit Order, which was still forbidden by a Law of the empire, roused the opposition to the Hertling Ministry to increased violence. By a decision of the Federal Council of Nov. 28 1912 dissolving this secret edict of the Bavarian Government, the controversy about the Jesuits was eliminated, but new subjects of conflict soon arose.

On Dec. 12 1912 Prince-Regent Luitpold died in his ninety-second year. His son Louis assumed the regency, and took the oath to the constitution on Dec. 27.

The movement for ending the regency (which had lasted since 1886 and was due to the insanity of King Otto) and conferring the royal dignity upon the Regent, coincided in point of time with the bill introduced by the Government for increasing the Civil List from 5 to 6½ million marks (£270,000). After protracted debates, by which the internal conflicts of the country were intensified, the Diet on Oct. 30 1913 passed, by a majority of 122 against 27 Social Democratic votes, an amendment to the constitution ending the regency of Prince-Regent Louis and entrusting the authority to the Upper Chamber. After the Upper Chamber had given its assent, Prince Louis issued a proclamation on Nov. 5 announcing his assumption of the crown. The demand for the increase in the Civil List was granted by the Diet on Nov. 21 against a minority of 50 Liberals and Social Democrats.

The War Period.—The truce to party politics (Burgfrieden), which had completely silenced political conflicts at the outbreak of the war, continued as an after-effect, to mitigate them. In 1915 the edict regarding the declaration of loyalty to be signed by the railway-men was withdrawn; in 1916 the Minister of the Interior, von Soden, who was widely attacked on the ground of his agrarian food policy, was replaced by the former Minister of the Interior, von Breebriech, while Gen. von Hellingrath replaced Gen. von Kress as Minister of War. In the later years of the war, when discontent due to the oppressive war burdens was accompanied by increasingly powerful efforts to carry democratic reform, resolutions of the Social Democrats in favour of proportional representation, a parliamentary régime, and the abolition of the Upper Chamber were repeatedly rejected by the majority of the Chamber of Deputies; but the Government promised at least to introduce a bill for the overdue reform of the Upper House (Kammer der Reichsräte). On Nov. 10 1917 Count (as he had now become) Hertling resigned the presidency of the Ministry in order to assume the office of chancellor of the empire. He was succeeded by Herr von Dandl, hitherto chief of the Civil Cabinet of the King.

The imminence of the revolution, a consequence of the disaster experienced by the German arms, was felt as far back as Jan. 1918 in Bavaria as in the empire. The band of Independent Socialists led by the Social Democratic newspaper editor, Kurt Eisner, did not succeed, it is true, in launching a general strike of munition workers, but there were demonstrations in Nürnberg and Fürth and also in Munich, leading in some cases to street conflicts. Eisner himself and a number of his partisans were arrested and kept in custody with a view to their trial. He was set at liberty only by the political amnesty which the Government of Prince Max
of Baden issued for the whole empire. In the summer and autumn of the year 1918 there were instances of insubordination in one or two Bavarian garrison towns among troops who were being sent off to relieve regiments at the front. Such breaches of discipline indicated opposition to the war in the army and among the population. Eisner was set up by the Independent Socialists in Oct. 1918 as their candidate at a by-election for the Reichstag in the constituency of Munich. At a series of election meetings he advocated the idea of a violent rising of the masses with the object of rapidly ending the war and overthrowing the ruling authorities.

After the War. On Nov. 7 the Social Democratic party and the Independent Socialists organized a mass-meeting on the Theresienwiese, a large park in Munich, in favour of peace; it was attended by about 150,000 workmen and passed off without incident. After the close of the meeting, however, Eisner with his adherents marched through the city, called out the soldiers from the barracks, occupied the guard-house of the royal residence, and formed on the same evening a provisional Workers' and Soldiers' Council which held its first sitting in the building of the Court. It issued a night-time proclamation issued in the early hours of the morning announced the deposition of the dynasty and the conversion of Bavaria into a republic. As the soldiers, with the exception of the officers, were almost unanimously in sympathy with the action of Eisner, and as the working classes and the rural peasantry led by the two Farmers' Leaguers, Joseph and Karl Gandorfer, made common cause with him, no serious resistance was offered.

The King had left Munich on the evening of Nov. 7 and taken refuge in the castle of Anif in Salzburg. On Nov. 8 the Workmen's and Soldiers' Council in Munich elected a new revolutionary Government with Eisner at its head as Minister-President. Other members of the new Ministry, in addition to Majority and Independent Socialists, were Prof. Jaffé as Minister of Finance and the former Minister von Fraundorfer as Minister of Communications. The new Government issued on Nov. 15 an elaborate programme, and Eisner himself endeavoured by the appointment of the pacifist Prof. Dr. Focsetzer as diplomatic envoy to Berne and by wireless messages to the Allies to promote the conclusion of peace on tolerable conditions. He encountered vigorous opposition in the Bavarian press, including Socialist and Catholic newspapers, and the former Minister von Fraundorfer even threatened to resign.

A powerful movement in favour of instituting general elections for the Constituent Bavarian National Assembly, but Eisner only yielded to it on Dec. 5. The elections were fixed for Jan. 12 1919. On Jan. 6 1919 the revolutionary Government issued an ordinance setting up a provisional constitution, which conferred upon the Ministry supreme executive powers and a veto upon decisions of the Diet. In the event of the veto's being employed, the vote of the people was to give the final decision. The revolutionary Government was, moreover, to exercise legislative powers until the enactment of a definitive constitution. The elections of Jan. 12 resulted in a powerful displacement of political power towards the Left. The Bavarian People's Party (Volkspartei), which had constituted itself on an independent basis as the successor of the Catholic Centre party in Bavaria, won 66 seats, the German People's Party (former National Liberals) and the German Nationalists (old Conservatives) nine seats, the Farmers' League 15 seats, the Democrats 25 seats, and the Social Democrats 105 seats.

The National Assembly was convoked for Feb. 21. Meanwhile the masses had become more and more extremist in the Bavarian capital. There were repeated demonstrations which led to collisions and riots. Although Eisner made great efforts to prevent bloodshed, he could not make up his mind to dissociate himself unequivocally from the extremist elements which were coquetting with Bolshevik ideas. On Feb. 21, when on his way to the Diet in order to inform it of the resignation of the revolutionary Government and to invite it to elect a new ministry, he was shot dead by Count Arcò, a former officer. Before the Assembly could adopt any attitude towards this assassination, it was broken up by the infuriated adherents of Eisner. Men armed with pistols stormed the House and the Social Democratic Minister of the Interior, Acuer, who had been wrongly accused of participation in the conspiracy against Eisner, was severely wounded by a shot in the chest, while one deputy and one official were mortally wounded. There followed a period of lawlessness when everyone did as he pleased, since there was no one able to exercise control and for evading the threat of the various powers of State. The Congress of Councils (Soviets), which met after the assassination of Eisner, arrogated to itself supreme power, and it was only after protracted negotiations between this Congress and the Social Democratic party, which had identified itself with the opposition in the provinces to the usurpation of the Munich Congress, that it was possible to form a new Government. The Social Democratic deputy, Hoffmann, who had been Minister of Education under Eisner, undertook the presidency of the Ministry; the Government was composed of Independent (extreme) and Moderate (extreme), Socialists. The National Assembly met for but a brief sitting and transferred the power of legislation to the Ministry until law and order could be reestablished. Meanwhile things did not settle down; on the contrary, the situation in the capital became more and more confused. As the Government did not consider that it possessed in Munich the power to carry through its will, it left the city two days before the proclamation of the Congress (Soviet) Republic and betook itself to Northern Bavaria, where it hoped to find support among those sections of the population whose opinions were Democratic. In Munich a dictatorship of a number of extremists, under the influence of Bolsheviks such as Levin and Levin-Nissen, held sway for four weeks under the name of Councils Republic. The fugitive Socialist Government took up its residence at Bamberg, where the National Assembly also met. With the military support of the Reich, action with Prussian, Württemberg and Bavarian troops was initiated against Munich and culminated in the capture of the capital and the suppression of the extremist insurrection after severe fighting on May 1, 2, and 3.

The final phase of the struggle was characterized by some acts of barbarity, such as the murder of a number of civilians, including a Chartist, a cell by the Soviet extremists. Unfortunately in the suppression of the "Red Terror", grave excesses were likewise perpetrated by the other side. There were numerous summary executions and arbitrary arrests, so that in some instances persons who were entirely innocent lost their lives or were put in prison. Northern Bavaria had taken no part whatever in the movement. The Diet remained for the time being at Bamberg. The Government, after the Independent Socialists had left it, was converted into a coalition by the inclusion of two members of the Democratic and two of the Bavarian (Catholic) People's party, with Hofmann as Minister-President. It submitted to the Diet the draft of a constitution which gave effect to the ideas of parliamentary democracy and which also provided for the exercise of the referendum under certain conditions. A number of other measures for completing the edifice of the democratic State were submitted, and the whole session of the Diet at Bamberg was occupied with the consideration of these. The constitution (see below), the Teachers and Schools law and a number of other important laws were passed. The new constitution bears the date of Aug. 14 1919. It was only in the autumn when order had been restored throughout the whole country that the Government and the Diet returned to Munich. In order to prevent the recurrence of a situation like that which had existed under the Councils (Soviet) Republic, the Government had caused so-called Einwohnerwehren (volunteer defense forces of the inhabitants) to be formed; in these armed bodies the citizens who took their stand upon the constitution united on a democratic basis for the protection of public order and for the defense of the constitution against popular coups. They elected their own leaders.
and endeavoured to act as private organizations without any connexion with regular military bodies. The idea of the Einwohnerwehren rapidly took a firm hold, especially among the non-Socialist (bürgerlich) section of the population, so that these bands of volunteers developed into a powerful and well-equipped voluntary organization. The Kapp Putsch which had resulted in a change of Government in the Reich, also produced certain effects in Bavaria. Although the movement did not secure any open adherents there, it brought about a domestic crisis in the course of which the Socialist ministers left the Cabinet. A Declaration of the new president, von Kahr, was elected president of the Ministry, and the minister of the Cabinet were taken from the adherents of the Bavarian (Catholic) People's party, the Democrats and the Liberal Farmers' League (Bauernbund). The elections for the Diet, which took place simultaneously with those for the Reichstag on June 6 1920, exhibited a natural reaction after the hardships which the country had had to suffer from the excesses of the extremist groups during the 18 months following upon the revolution; there was a great increase in the strength of the non-Socialist (bürgerlich) parties. Only 27 Social Democrats, 22 members of the Bavarian Conservatives, 11 of the Bavarian Democrats, which supported the Diet and two Communists were elected, while on the other hand 108 members of the non-Socialist parties were returned. Among the latter the Democrats had, however, lost many seats to the German Nationalists (the old Conservatives) and to the German People's party (the old National Liberals). Herr von Kahr was again entrusted with the formation of a Cabinet; he selected one Farmers' Leader, one German Nationalist (Conservative) and one Democrat, and filled the other ministerial posts with members of the Bavarian People's party and with officials who were in sympathy with that party. He received powerful support from a party organization in the country which was the rival of the Farmers' League, the Catholic Peasants' Union (Bauernverein), at the head of which was the gifted and popular Dr. Heim, who has been called "the uncrowned King of Bavaria." On the whole the country remained free from domestic disturbances. On the other hand the necessity of disarming and disbanding the Einwohnerwehren in accordance with the Treaty of Versailles led to protracted and difficult negotiations with the Government of the Reich and to an exceedingly critical situation for the Kahr Ministry in Bavaria itself, as that Ministry had many respects a source of perplexity to the country. The Bavarian Government were prepared to make the sacrifice of disarmament. The Government had previously been vigorously pressed in this sense by the Opposition and in particular by the Independent Socialists. Their leader, Gareis, an able young man in his thirty-second year, was assassinated, doubtless by the hand of a reactionary, on his way home from a meeting on the evening of June 9 1921, an event which once more threatened to arouse the insurrectionary fury of the industrial masses.

Altogether the position of Bavaria within the Reich remained in many respects a source of perplexity in 1921. Much would depend upon the degree of success with which the Central Government (of the Reich) in Berlin might be able to grapple with problems of home, and more especially of foreign policy in carrying out the provisions of the Treaty of Versailles.

(O. S.)

The New Constitution.—During the night between Nov. 7 and Nov. 8 1918, before the imperial régime had been overthrown in Berlin (Nov. 9), the revolution broke out at Munich. The House of Wittelsbach was expelled. The Independent Socialist, Kurt Eisner, one of the most remarkable personalities of the revolution, put himself at the head of the revolutionary Government. It was contemplated that a newly elected Diet (Landtag) should provide the new republic of Bavaria with a basis of legality by means of a constitution. The electoral regulations issued with this object on Dec. 9 1918 conferred the franchise upon all Bavarians, without distinction of sex, who had reached their twentieth year. In order, however, to safeguard the results of the revolution Eisner's Government promulgated before the elections for the Landtag the provisional Fundamental Law of Bavaria, the "Socialist Republic of Bavaria," and this fundamental law provided for the establishment of parliamentary Government. The Diet was to have met on Feb. 21 1919. On that day Eisner was assassinated; the disorders which followed prevented the Diet from taking hand at once the preparation of the definitive constitution. What the Diet adopted in the first instance was once more a provisional "Fundamental Law of the State," which corresponded in essentials with the first provisional law and came into force on April 2 1919. Thereafter the fresh revolution of the Bavarian Conservatives, which had been brought about by the dissolution of Eisner, broke out. Under the leadership of Russian Bolsheviks, the "Councils Republic" of Bavaria was set up. By May 1 the domination of the Communists was again at an end. The Diet could reassemble, though, at first, not in Munich.

On May 28 1919, the draft of the text of a constitution for the "Free State of Bavaria" was submitted to the Diet by the Hoffmann Ministry. After detailed consideration the Constitution was voted and came into force on Aug. 14 1919.

The constitution starts from the assumption that Bavaria continued to exist as a state within the German Reich. This conception was still more strongly emphasized in Eisner's provisional "Fundamental Law of the State" than in the constitution which was finally adopted. The Bavarian Fundamental Law was based on the declaration, "Bavaria is a member of the United States of Germany (the German Reich)." Eisner indeed vigorously defended the conception of federalism in opposition to the view that Germany had by the revolution become a single, united state (Einheitsstaat). On the publication of the first draft of the constitution of the Reich, which was essentially unitarist, Eisner brought about a conference of representatives of the German states, at which the South German states succeeded in securing the institution of a permanent "Committee of the States." This committee or delegation cooperated in the legislation which followed, particularly in the preparation of the Fundamental Law of Bavaria. The Bavarian Diet, as an organ of the Reich, originated in this committee. It is true that Bavaria, notwithstanding its resistance, had not only to give up its sovereignty to the Reich but to acquiesce in the restrictions of its independence. It had to cede to the Reich the control of foreign policy, of the army and of communications, in particular the railways: it may not maintain in foreign countries either legations or consulates of its own. It has also been subjected to considerable restrictions in its economic policy by the Reich, as economic legislation falls within the competence of the latter, while the financial legislation of the Reich has appropriated almost all the sources of taxation. All the greater were the efforts made in the Bavarian constitution to give effect in its provisions to the residue of sovereignty which has been left to the territories (the Free States) in the Reich. It is true that Bavaria has, in the last resort, no control over its own laws, and that the Reich may exercise a "declarative power" (the initiative), the popular decision (Volksentscheidung) regarding a law or regarding the dissolution of the Diet is brought into action. In order to bring about a decision of this character, a formal pro-

1 Reservatrechte, which were secured for it under the constitution of the Hohenzollern Empire.
BAZIN—BEATTY

poal, which must have been supported by at least one-tenth of the citizens possessing the franchise, is requisite. If it be a case of an abolition of the franchise or of the dissolution or of the support of one-fifth of the electorate is required. This right of direct cooperation by the people is intended to be a substitute for the "balance of powers" which is lacking in the constitution. To this extent the power of Davy is incontestable, but the conduct of the other German territories and that of the Reich, contains an element which signifies "direct democracy.

In this single Chamber. There is no Upper House. All men and women who have completed their twentieth year have the franchise. They elect the deputies by secret ballot on the basis of proportional representation, arranged so there is a deputy for every 10,000 inhabitants. The details of electoral procedure are fixed by a separate electoral law. Only citizens of Bavaria who have completed their twenty-fifth year are eligible.

The ministry is appointed by the Diet in the following manner. First, the ministerial candidate is elected. He submits a list of the candidates whom he proposes for the other ministerial posts, and the ministers are appointed with the assent of the Diet. It is not requisite that ministers should be members of the Diet. The red organ of the executive is the ministry as a whole, but it is at the same time, as follows from what has been said, dependent upon the Diet. The ministry adopts its decisions by majority. The minister-president presides over the whole ministry and has casting voice when the voting is equally divided. The ministry distributes the affairs of the state among the different ministerial departments and makes the appointments to the most important administrative posts. It has no power to alter for the better the terms of appointment of any minister, except when the ministry is calling for the constitution or one of the laws, he may be impeached by resolution of the Diet before the Court of Jurisdiction in State Affairs (Staatsgerichtshof). The penalty for ministry which are found guilty is the dismissal or, what is the same, the absence of the Diet.

The ministry consists of members of the Diet; the minority is composed of official judges.

Legislation is conducted in the following manner: The Diet votes on the bills which are initiated among its own members or are laid before it by the popular initiative (Volksemissiionen). An appeal to the popular decision (Volksentscheidung), or referendum, on an initiative act arises (1) when the Diet rejects (Volksemissiionen) for the enactment of a law; or (2) when the Diet passes a law without a popular demand for it having been presented, and when thereupon an appeal is made to the popular decision (Volksentscheidung) either in consequence of a resolution of the ministry or in consequence of a popular demand (Volksemissiionen) for the referendum. There is, however, an important class of laws which are exempt from the referendum, in particular laws relating to the budget or relating to taxes or excise duties, and laws dealing with the salaries of officials. There is likewise no referendum in the case of a law which the Diet has declared to be urgent. The Diet may be annually faced by the Diet by legislation. But, in order to preclude reckless finance on the part of the Diet, the constitution prescribes that, on the demand of the ministry, there shall be a second reading of those financial resolutions which have the power of imposing new items or of augmenting fresh items of expenditure. At the second time of voting such resolutions a majority of two-thirds of the members present is requisite. Once the measure is voted, it is dispatched by the president of the Diet to the minister-president, and is submitted to the cabinet.

BAZIN, RENÉ (1853– ), French novelist and man of letters (see 3,561), produced two further novels, Davidele Biot (1912) and Gingolph abandonné (1914), as well as a volume of travel sketches, Nord-Sud Amérique, etc. (1913) in the pre-war period. After 1914 he published two volumes of war sketches, Pages religieuses (1915) and Aujourd'hui et demain (1916), as well as two novels, La Closiere de Champeolent (1917) and Les nouveaux Oberlé (1919).

BEECH, REX (1877– ), American writer, was born at Atwood, Mich., Sept. 1 1877. He was educated at Rollin College, Fla. (1891–6), the Chicago College of Law (1896–7), and Kent College of Law, Chicago (1899–1900).

His tales of adventure include Paraders (1905); The Spotters (1906, also dramatized); The Barrier (1907); The Silver Horse (1909); Going Some (1910, also dramatized); The Nèer-d-o-Well (1911); The Sweeper (1911); The Priests of Gweal (1912); The Mexican Auction (1912); The Heart of the Desert (1915); Rainbow's End (1916); The Crimson Garden, and Other Tales of Adventure (1916); Laughing Bill Hyde and Other Stories (1917); Too Fat to Fight (1919); Oh, Shoo! (1921).

BEATTY, DAVID BEATTY, 1ST EARL (1871– ), British admiral, was born in Ireland in 1871, the son of Capt. D. L. Beatty, 4th Hussars, of Borodale. He was not, so many naval officers are, destined to his profession by family asso-

ication or tradition, which in his case took its tone chiefly from the army and the hunting-field; his father was a well-known figure in the Leicestershire world of the 'eighties and 'nineties. That David alone of the family went into the navy was largely a matter of accident, and his own choice at the age of 13, when he was sent to the Royal Naval Academy at Gosport, can certainly have had little to do with it. Yet within 35 years of that date he had run through the whole gamut of naval possibilities, including those attained only rarely by naval men of any age—Commander-in-Chief of the Grand Fleet, Admiral-of-the-Fleet, and First Sea Lord—to say nothing of an earlom, the thanks of Parliament, the O.M., and the Lord Rectorship of Edinburgh University. His sea service combined the maximum of variety with a minimum of mere routine. As midshipman he served in the Mediterranean flagship "Alexandra," and with the training squadron in the "Ruby." He was sub-lieutenant in the "Nile" and the yacht "Victoria and Albert." His six years of service as lieutenant were passed in the "Ruby," "Camperdown" and "Trafalgar," in the Portsmouth destroyer flotilla, and in the Nile gunboats. His service there and in the battles of Atbara and Omdurman won him his commandship, and in that rank he served in the "Barlesea." The Boxer rising gave him another opportunity of active service; he was wounded while in command of a shore party, when his dash and leadership won him further promotion, and he became captain at the record age of twenty-nine. From 1900 to 1910 he was in command successively of the cruisers "June," "Arrogant," and "Suffolk," and at the battle of the 

NEIL (March 1). In the naval manœuvres of 1910 he flew in the "Aboukir" his flag as rear-admiral, a rank which he had attained 24 years before the day of his 13 entered Gosport Academy.

Even up to this point his career establishes a record in the history of the navy. It was, in a sense, so far as the navy was concerned, an obscure career, unhelped by "influence," unknown to the public, undistinguished by the kind of fame attained by the passing of examinations. It was remarkable only by its brilliant rapidity. What he had done he had done by himself, and he had come under no personal influence with the possible exception of that of Lord Kitchener as Sirdar, that had particularly inspired or moulded him. He was never at the top of any of the lists of his rank, but generally near the bottom, from which he would leap, by sheer merit of service, to a similar humble position at the bottom of the next list, thus passing on the ladder hosts of officers who were laboriously climbing by the routine of seniority and the death or promotion of those above them. To make legal his promotion to flag rank in 1910 a special Order in Council had to be passed, as he had not served the statutory time in command of a ship at sea. His two Admiralty appointments afforded him brief but valuable experience. While still a captain he had acted for a about a year as naval adviser to the War Council; and under Mr. Churchill he became naval secretary to the First Lord. In this capacity he assisted at the conference held at Malta in 1912 when the decision was made to reconstitute the Mediterranean fleet by replacing the older battleships by a smaller but more modern force of battles cruisers. In 1913 he was appointed to the command of the First Battle Cruiser Squadron, the fastest and most powerful scouting force ever launched, and hoisted his flag in the "Lion" (March 1).

From this brief outline of his service career it will be observed that Beatty escaped two things. By seizing every opportunity for fighting service he avoided that long period of drudgery in big ships which had for some time been recognized as having a deadening effect on the fighting spirit and initiative of naval officers. Similarly he was equally successful in avoiding long periods of shore service at the Admiralty which, valuable as they may be as a training in administrative work, do not tend to develop the entirely different set of qualities demanded of an officer in high command aloof in time of war. Of administrative work in the large sense Beatty had practically no experience at all when he hoisted his flag in the "Lion" and pro-

ceeded to train the newly formed squadron. In some ways it was an advantage. He came to this vital task with an original and untrammeled view of its essential objects, with an instinct for warfare developed in actual fighting, and with a mind unduly by subservience to that long grind of routine which is the inevitable avenue to flag rank except for the fortunate few who, like him, can gain early promotion for fighting services.

Throughout his career, when Beatty was given the choice of decoration or other distinction as a reward for such service, he always chose promotion. He had an unaffected certainty that war with Germany would come in his time; and in so far as it lay in his power to shape his career, he shaped it so that he should be in a position to take a leading hand when the hour struck. As it was, with all the brilliant rapidity of his advancement, the war came just a little too soon to give him the out-
set, and at the most vital moment, the position of commander-in-chief, which no doubt would have come to him almost as a matter of course if he had had a little longer in which to prove his undoubted qualifications for that post. When he did suc-
cceed to it the pioneer work of fleet organization had been done by Sir John Jellicoe, and the policy governing the making of the Grand Fleet as a strategic weapon had been, for good or ill, definitely established.

When the World War broke out, Beatty, although long marked by an intelligent few as certain to achieve distinction, was practically unknown to the navy at large. The routine Home fleet service in which officers get to know each other intimately had claimed little of his time; and when he took command of the battle cruisers even Lord Fisher had never met him. But a very few weeks of war service revealed his quality as a leader. In the Heligoland Bight (Aug. 28 1914), a reconnaissance of light craft in which the battle cruisers were acting in support of Commodores Keyes and Tyrwhitt, Sir David Beatty exhibited his remarkable instinct for being at the right place at the right moment. Partly owing to faulty Admiralty dispositions the British light craft, after the first object of the action had been achieved, were in danger of being cut off when Adm. Beatty, acting not so much on information as on his intuitive sense of the position, turned back through a submarine-infested area and arrived just in time to save them and sink every German ship in the immediate neighbourhood. Then and throughout the war his battle cruisers were the spearhead of the British naval forces.

In a score of operations of which, as they did not result in con-
tact with the enemy, history takes no note, and in the two which developed into fleet actions, Beatty, in his famous flagship the “Lion,” was the leading spirit and pivot of the fighting forces. A true disciple of Nelson, he was a rebel against the official conception of British strategy that, provided the enemy were properly contained, his destruction was a kind of luxury that might be indulged in only on condition that the containing force was not unduly risked. Beatty, on the other hand, was inspired with the spirit of attack. He had unique qualities the leader which made men willing to follow him anywhere, and to achieve the impossible; but apart from his dash and courage he showed consummate skill and caution in dealing with the new hidden elements which have placed so great a power in the hands of the defensive in modern naval warfare. At the battle of the Dogger Bank (Jan. 24 1915) he chased the enemy for three hours, inflicting such severe punishment that the “Blücher” was sunk and the “Seydlitz” and “Derrfjeller” and “Moltke” were in full flight, the two former in a bat-
tle-irresistant condition. In the Heligoland operations, his headstrong line had received heavy punishment, and was put out of action, and the command devolved on Rear-Adm. Sir Archibald Moore. This officer, whose flag was flying in the “New Zealand,” gave no orders during the vital 40 minutes following the “Lion’s” disablement. Adm. Beatty’s signals to “keep nearer to the enemy” were either missed or misunderstood by the ships immediately following him, with the result that touch with the German battle cruisers was lost, and what was on the point of becoming a complete victory was left merely as an indecisive castigation of the enemy. The facts of this action, which had not been officially made public up to the spring of 1921, were first given at that date in Mr. Filson Young’s *With the Battle Cruisers*, containing a very full account of the battle, with track charts and the actual text and times of the signals made.

Beatty’s brilliant handling of the battle cruisers in the battle of Jutland is discussed in the article on that action (see JUTLAND, BATTLE OF). Some months later (Dec. 1916) he succeeded Sir John Jellicoe as Commander-in-Chief of the Grand Fleet, in which capacity he received the surrender of the German fleet on Nov. 21 1918. He was raised to the peerage in 1918 as Earl Beatty, Visc. Borodale of Borodale, Baron Beatty of the North Sea and by the thanks of Parliament and £100,000. At the same time he was awarded the G.C.B., the O.M. and other honours and decorations. In 1919 he became First Sea Lord, and immediately set in motion measures for a reorganization of the naval staff on lines which would give the younger school of naval thought and experience a chance to make itself felt. He attended at Washington, D.C., in 1921 at the Conference on the Limitation of Armament.

The following estimate of Lord Beatty was given in the book referred to by Mr. Filson Young, who had served on his staff in the “Lion.”

“One who has served and observed him closely in the stress of war may at least bear this testimony to his conduct in the chapter of his life which is already over: that in everything that he did or attempted he showed forth in himself and evoked in others the true spirit of the man who made the Ancilla, the best of the common view of him as a dashing leader trusting largely to luck, which so much endears a man to the ordinary English mind, is singularly untrammelled. The man was not the mere instinct of the hunting-field, strong as it was in him, that brought him to the head of the Navy. His caution and his sense of responsibility were just as remarkable as his enterprise; but they were never allowed to obscure or dominate his enterprise. Perhaps the greatest tribute one can pay to him and to the Navy is to say that in the qualities in which he stood supreme he was not exceptional, but typical; and it was because he was a product of the modern Navy and contained in himself all its most characteristic qualities, that the Navy would have trusted and followed him anywhere.”

Lord Beatty married in 1901 Ethel, daughter of Marshall Field, sen., of Chicago; of his two sons the elder, Viscount Borodale, was in 1921 a cadet in the Royal Navy.

**BEAUCHAMP, WILLIAM LYGON, 7TH EARL (1872–)***

English politician, was born in London Feb. 20 1872, the eldest son of the 6th earl. He was educated at Eton and Christ Church, Oxford, and afterwards entered public life as a Liberal. In 1891 he succeeded his father in the title. He was mayor of Worcester from 1895 to 1896, and in 1897 became a member of the London School Board. In 1899 he was appointed governor of N.S.W., but in 1901 returned to England. In 1907 he became lord steward of the royal household, and in 1910 entered Mr. Asquith’s Cabinet as first commissioner of works and lord president of the council, retaining the latter post on the reconstruction of the Government in 1914. He received the Order of the Garter in 1914, and retired in 1915.

Lord Beauchamp was from 1906 to 1907 captain of the Honour-
able Corps of Gentlemen-at-Arms, and in 1913 was made lord warden of the Cinque Ports. He married in 1902 Lady Lettice Grosvenor, daughter of Earl Grosvenor and sister of the 2nd Duke of Westminster.

**BEAVERBROOK, WILLIAM MAXWELL AITKEN, 1ST BARON (1879–)***

British politician, was born at Newcastle, New South Wales, on May 25 1879, the son of the Rev. William Aitken, Presbyterian minister of Newcastle. He was educated at Newcastle, and afterwards went into business, where he had a very successful career as a financier. Having made 1 The Financial Secretary to the Admiralty answered in the affirmative a question asked in the House of Commons on May 4 1921 by Visc. Curzon as to whether the account given in this book might be taken as correct. Its publication then relieved Adm. Beatty of any responsibility for the somewhat misleading version originally issued by the Admiralty of his own dispatch after the battle.
a large fortune at a comparatively early age, he came to England in 1910, and stood successfully for the House of Commons as Unionist candidate for Ashton-under-Lyne. He was from the first an intimate friend and adviser of Mr. Bonar Law when the latter became the Unionist leader. In 1911 he was knighted. In 1913 he went to France with the Canadian expeditionary force as "Eye-Witness," and in 1916 became the representative of the Canadian Government at the front, doing valuable propaganda work. He was created a baronet in June 1916, and the same year was raised to the peerage. In 1917 he was appointed officer in charge of the Canadian war records, and in 1918 entered the Government as Chancellor of the Duchy of Lancaster in succession to Lord Cawley and director of the Ministry of Information in succession to Sir Edward Carson, but resigned in Oct. of the same year. Lord Beaverbrook became one of the chief proprietors of the London Daily Express, and in 1916-7 published Canada in Panders.

BEBEL, FERDINAND AUGUST (1840-1913), German social-ist (see 3,601). During Bebel's last year he views regarding the revision of the Social Democratic programme underwent a considerable change; he ultimately favoured revision in the sense of cooperation with non-Socialist political parties in democratic reforms. In the Reichstag he continued to oppose with great energy the world-policy and the naval expansion with which William II. and his successive chancellors were identified. At the same time he guarded himself against the reproach of favouring a policy of non-resistance to foreign aggression, and on one occasion declared that he would be the first to shoulder his shield if Germany were invaded. His attitude towards imperial and colonial policy was thoroughly un-compromising. He denounced the complaisance of Prince Bülow's Government towards the Russian Government in respect of the treatment of Russian political refugees, and it would hardly be too much to say that he would have welcomed a rupture with Russia on almost any ground. His influence in this regard powerfully contributed to foster those sentiments in the Social Democratic party which led it, a year after his death, to acclaim the declaration of war against Russia on Aug. 1, 1914. In internal affairs he particularly distinguished himself by his denunciation of the maltreatment of soldiers by officers and superiors more frequently by non-commissioned officers. His efforts in this matter had received great encouragement when Albert of Saxony (1828-1902) issued an edict dealing with the maltreatment of soldiers in the Saxon contingent, thus cutting the ground from under the feet of the Imperial Government, which had persistently attempted to deny or to explain away the cases adduced by Bebel. Bebel had amassed a fortune—some £30,000, it is said—from the proceeds of his writings, and this was increased by a legacy of some £20,000 left him, curiously enough, by an officer who had profited by his advice in a disciplinary case in which the officer had once been involved. He owned a villa on the Lake of Zürich where in later life he spent a great part of the year. One of his last public appearances was at an International Peace Conference at Bern in 1913. He died at a sanatorium at Passugg, Switzerland, on Aug. 13, 1913.

BECK, FRIEDRICH, COUNT (1830-1920), Austrian general, was born at Freiburg im Breisgau, and entered the army in 1848. He distinguished himself as chief-of-staff of an infantry division at Magenta, and in 1863 was made personal aide-de-camp to the Emperor. He held this position, with that of adjutant-general of the imperial military chancery until 1882, when he was made chief of the Emperor's chancery and exercising the greatest influence on all military questions. In 1886 he acted as the Emperor's confidential agent at the headquarters of Field-Marshal Benedek, before and after the battle of Königgrätz, and his advice was of great importance, though it was not always followed. In 1878 he was entrusted with a similar mission to the commander-in-chief of the troops operating in Bosnia. In 1882 he was made chief of the general staff of the Imperial and Royal army, an exalted position which he occupied till 1906. Not only was his advice listened to in military affairs, but he frequently exercised great influence on important political and personal questions, gaining a great reputation throughout the monarchy as one of its most influential men. His clear judgment and practical common-sense enabled him to see and judge men and things from a purely objective standpoint. He was retired at the age of 77, with every possible sign of honour, and was appointed commander of the Imperial Guard. He took no part in the event of the World War, and in 1919 he published a book called Der Kaiser, der General und der Feldmarschall Koniggratz.

BEECHAM, SIR THOMAS, 2nd Bart. (1879- ), English musical conductor, was born April 29, 1879, son of Sir Joseph Beethoven, 1st bart. (1848-1916), who, had made a large fortune at St. Helens, Lancs., as proprietor of "Beethoven's Pills." Young Beethoven was educated at Rossall and for a time at Wadham College, Oxford. His father was keenly interested in music and had given financial support to a number of musical enterprises in the North of England, where the son acquired considerable experience as a conductor. In 1905 he gave his first concert in London with the Queen's Hall orchestra. A little later he founded first the New Symphony orchestra and next the Beethoven orchestra, both first-rate concerns. In 1909 he appeared in London as opera conductor, and in Feb. of the following year the Beecham Opera Co., consisting entirely of English-speaking singers, was inaugurated. The season was started at Covent Garden in the following year when among other operas produced for the first time in London were Strauss's Elektra (Feb. 1910), Delius's Romeo and Juliet in the Village and Debussy's L'Enfant Prodigue. In the same year there was a further season at His Majesty's theatre during which Strauss's Feuersnot was given, its London première. Further London seasons followed in later years, all with decided artistic success. These led up to the great climax when in 1913 the Beecham season of opera and ballet at Covent Garden included the production of Strauss's Rosenkavalier and The Legend of Joseph. Later in the same year there was a magnificent season at Drury Lane of Russian opera and ballet, made famous not only by the splendour of the productions of Russian opera in the vernacular, which in all probability would never otherwise have been heard in London, but by the remarkable singing and still more remarkable acting of Shaliapin, who then made his first appearance in England. During the second and third years of the World War there were Beecham seasons of opera at the Shaftesbury and Aldwych theatres, when pronounced success was achieved by performances of Valkyrie and Tristan and Isolde sung in English. Beecham's own version of Bach's cantata Phoebeus and Pan was given at the latter theatre. In 1917 the Beecham Opera Co. were once more at Drury Lane, and in 1920 Beecham organized a somewhat ill-starred cosmopolitan "grand" season at Covent Garden, during which Puccini's so-called triptych, Il Tabarro, Suor Angelica and Gianni Schicchi, was given for the first time in Great Britain. From 1915 to 1918 Beecham was conductor of the Royal Philharmonic Society, whose very existence during the World War he practically guaranteed. In 1916 he was knighted, and shortly afterwards he succeeded to his father's baronetcy. The lavish expenditure of his private fortune upon opera in English ultimately led to financial embarrassment, and in 1920-1 necessitated the suspension of his musical activities.

BEECHING, HENRY CHARLES (1859-1910), English divine and author (see 3,690), who was appointed dean of Norwich in 1911, died at Norwich Feb. 25, 1910.

BEERBOHM, MAX (1872-1897), English writer and caricaturist, was born in London Aug. 24, 1872, the son of Julius Beerbohm and Fiza Draper, and half-brother of the actor, Sir Herbert Beerbohm Tree. He was educated at Charterhouse and Merton College, Oxford, and afterwards became well known as a contributor to the Yellow Book and dramatic

* These figures indicate the volume and page number of the previous article.
BEERE—BEHAVIOURISM

critic on the Saturday Review. He married in 1910 Miss Florence Kahn, of Memphis, Tennessee, and afterwards took up his residence at Rapallo, Italy. His published writings include The Works of Max Beerbohm, containing the famous essay on George IV., and also A Defence of Cosmetics (1860); The Happy Hypocrite (1897); More (1899); Zuleika Dobson (1911); A Christmas Garland (1912); Seven Men (1910), and And Even Now (1920). He also contributed to and edited the Life of Sir Herbert Beerbohm Tree, published in 1920. He is well known by his caricatures, of which exhibitions have been held in London at the Corfax Gallery (1900) and the Leicester Galleries (1911, 1913, 1921). In 1917, a Modern Loan Exhibition at the Grosvener Galleries included a group of 15 caricatures entitled “Rossetti and His Friends.” Many of his caricatures have been published in Caricatures of Twenty-five Gentlemen (1896); The Second Childhood of John Bull (1901); The Poets’ Corner (1904); A Book of Caricatures (1907); Fifty Caricatures (1913). His delicate and incisive satire has found its best material in the peculiarities of individuals in every section of society. Movements he almost invariably typifies by some well-known personality. Pledged to no party, his friends are securesome. Those close to his series with the New English Art Club and with Mr. Balilour. Like Forain and Steinlein in his detachment, he lacks their universality; and complete appreciation of his art implies an intimate knowledge of current affairs. As a draughtsman he is not faultless, and sometimes resorts to the veriest conventions; but his freedom of line, feeling for delicate colour and sense of design are remarkable, especially in his later work. (W. G. C.)

BEERE, MRS. BERNARD [Fanny Mary] (1856-1913), English actress, was born at Norwich Oct. 5 1856. She was the daughter of Wilby Whitehead and was trained for the stage by Hern薇 Vezin, appearing first in the Opera Comique, London, in 1877. Later she played Emilia in Othello and various other English comedy parts at the St. James’s theatre. In 1883 she was engaged by the Bancrofts to play leading parts in Fёdora and other dramas at the Haymarket. In 1891 she played Lady Teazle in Charles Wyndham’s production of School for Scandal, and two years later Mrs. Arbuthnot with Herbert Tree in Oscar Wilde’s A Woman of No Importance. She was three times married, but for stage purposes retained the name of her second husband. In 1900 she married Mr. A. C. S. Olivier. She died in London March 7 1913.

BEESLY, EDWARD SPENCER (1851-1915), English positivist (see 3.644), died at St. Leonards-on-Sea July 7 1915.

BEGAS, REINHOLD (1831-1911), German sculptor (see 3.652), died Aug. 3 1911.

BEHAVIOURISM.—In the earlier article on Instinct (see 14.648) and also, though perhaps less obviously, in that on Intelligence in Animals (see 14.686), the stress was laid on behaviour. In later years attention has been turned more and more to what has become known in this connexion as “behaviourism.” What then is behaviourism? It has features in common with pragmatism and with neo-realism. It is however (as is the case with these other ‘isms) somewhat difficult to define. If we seek to elicit from the writings of this or that behaviourist a clear statement of the doctrine he champions or accepts, we find not a little divergence of opinion. And perhaps each would remind us that J. J. Thomson has spoken of science as a policy rather than a creed. What then is their common policy? One may reply without much fear of misinterpreting their aim: A resolute application of radical empiricism in the scientific interpretation of all behaviour and conduct. In this interpretation a good deal turns on the relation of behaviour to consciousness, in some sense of this word. “Critics of behaviourism,” says Weiss (1918), “do not recognize clearly enough that the term ‘consciousness’ varies in its meaning with nearly every person who uses it. There is no generally accepted definition or description; and the fact that psychologists and philosophers have been unable to reach an agreement is one of the conditions which has precipitated behaviourism.” As to behaviourists themselves he tells us that, thus far, they have agreed that the most convenient procedure is not to use it at all. It needs, however, but little acquaintance with their writings to realize that, so far is this from being a matter of common agreement among them, there is much discussion of the sense in which the adjective “conscious” as applied to behaviour is to be understood. Here again opinions differ. But let us put the question in a rather different form. Let us ask: In what sense is the word “consciousness” to be rejected by every behaviourist? As to the answer to this question there is a far larger measure of agreement.

In 1908 Sir William James asked the question: Does consciousness exist? His reply was that it does not exist as an hypostatized entity with the unique privilege of activity, but that it does exist as a function. In its negative aspect his answer excludes “the hypothesis of trans-empirical reality,” i.e. that from which proceeds what is sometimes spoken of as “an alien influx into nature.” The transcendental Ego of the philosophies, he urges, shows how “the spiritual principle attenuates itself to a thoroughly ghostly condition.” And he says roundly: “I believe that ‘consciousness,’ when once it has evaporated to this estate of pure diaphanity, is on the point of disappearing altogether. Those who cling to some sort of spirit-echo, the faint rumor left behind by the disappearing ‘soul’ upon the air of philosophy.” There is no activity of consciousness in this sense. “The healthy thing for philosophy is to leave off grubbing underground (in the realm of the trans-empirical) for what effects effectuation or what makes action act.” Activity in an empirical sense there is in plenty. It is change in progress referred to some “storm-centre” of change. It is change intrinsic to some system and not merely imposed upon it from without. But there is for scientific treatment no activity of a trans-empirical entity which may be regarded as the source of such change. When therefore a behaviourist says that “we need a psychology of human conduct to supplant the psychology of consciousness” (G. A. Tawney 1911), that which he seeks to supplant is a psychology which invokes what James spoke of as trans-empirical agency. It is probably not going too far to say that this marks a distinctive feature of behaviourist interpretation.

It should here be added that though this may with some confidence be said to be a distinctive feature of behaviourist interpretation it does not follow that if this be accepted one may infer that a writer who accepts it is to be ranked as a behaviourist. It is, for example, fully endorsed by Howard C. Warren in his Human Psychology (1920). But he says: “The behaviourist contends that the data of consciousness should be ruled out of science altogether because they are not causal factors. This narrowing of the scope of science has not justified itself up to the present. Self-observation has proved more useful than the study of behaviour in investigating the phenomena of human mental life.” It is questionable, however, whether all who label themselves behaviourists do contend that the data of consciousness should be ruled out altogether. R. M. Yerkes would not agree that this is so in animal psychology. And E. B. Holt, though he sails under the behaviourist flag in his Freudian Wish, assuredly does not rule out consciousness.

Let us broaden our outlook. If we extend the use of the word “behaviour” so as to include physical events, their modern treatment tends more and more towards behaviourism. “Our sole task,” says A. N. Whitehead, “is to exhibit in one system the characters and inter-relations of all that is observed. Our attitude towards nature is purely behaviouristic so far as concerns the formulation of physical concepts. His attitude towards physical events and their mental concomitants may be different. But his rejection of any “bifurcation of nature” and his polemic against a doctrine of ‘psychic additions’ (Concept of Nature, ch. ii.) is in line with the neo-realistic attitude of those behaviourists who deal with organic life. His percipient event is the homologue of the organism under the treatment of radical behaviourism. Neither the one nor the other stands in need of any “psychic addition” ab extra for the adequate interpretation of the facts. Each is set in a field
which for the physicist is a field of acceleration, and for the biolo-
gist and psychologist is a field of the environment to which the
organism responds more suo. The business of science in each
case is to formulate an answer to the question: Given such a
field, having what may be called varying density, what hap-
pen therein? One does not enquire: What makes that which
happens so happen? At least one does not ask any such ques-
tion. In the practical sense "what happens, so is it, and there
is a reason or ground for what makes action act." But on such terms where
does psychology come in? One has here to realize that there
are two schools of behaviourists. According to one school the
study of conduct is to supplant that of consciousness through
so-called methods of introspection. According to the other
school such study is to give new value and direction to psychol-
ogy and thus involves not the abandoning but a redefining
of the concept of consciousness. Here alliance is sought with
those whom they regard as in spirit, if not in name, one with
them in aim. Behaviourists of this latter school, while still
rejecting consciousness as a trans-empirical agent, and thus
avoiding all taint of animistic interpretation, all interaction
of mind and body as disparate entities, all so-called parallelism
and the like, none the less accept consciousness as an empirical
function. What does this mean? It is connected with what is
spoken of as the relational view of consciousness, and thus has
points of contact with the relational view of space-time. Indeed
F. J. E. Woodbridge (1905) says that we should use the expres-
sion "in consciousness" in a manner like unto that in which we
use the expression "in space" or "in time"; and just as we
do not ask if space and time, as such, affect things causally,
so too we should not raise the question of the causal efficiency
of consciousness.

The wedge of entry of the psychic regard, implied by the use
of the word "consciousness," is through the concept of aware-
ness. Lotze spoke of one physical body "taking note of"
others. Thus the earth takes note of the sun in a gravitative
field; iron filings take note of a magnet in an electro-magnetic
field. But awareness commonly implies some mental as well
as physical taking note of—something, however rudimentary,
of the nature of being acquainted with. Now if we speak of a
relational field of awareness as one in which this conscious
"taking note of" obtains, the organism which is stimulated
and responds is always central within that field. If we then
call this central term the psycho-organism, it is the locus of con-
sciousness in the sense of being aware. It is the experiencing
term in relation to terms in the environment which are expe-
rienced. That is one way of regarding consciousness in the
widest sense of the word. Consciousness is the class of all
instances of experiencing on the part of psycho-organisms.
Whitehead's perciptent event, taking note of physically, is also
a perceiving event, taking note of psychically. But of course
the psycho-organism, as perceiving centre, is that very com-
plexly integrated system of such psychical events which we
commonly call a mind.

There is, however, another way of regarding consciousness.
Instead of restricting the application of the word to processes
of minding within the percipient centre, the concept is extended
so as to comprise all that is in the field of awareness as minded.
That which one is aware of, no matter how distant its locus of
origin may be from the percipient centre, is "in mind," and
therefore "in consciousness," as a relational field. One is, no
doubt, conscious in seeing, or imagining, or remembering; but one
is also conscious of what is seen, imaged, or remembered. And
what one is conscious of has every right to be regarded as in
consciousness. This distinction between the "in" and the
"of" (as here used) goes back at least as far as Berkeley, who
spoke of perceiving as in mind "by way of attribute" and
of that which is perceived as in mind "by way of idea." We
sometimes speak of the former as "in consciousness" and of
the latter as "for consciousness"; or of the former as "sub-
jective" and of the latter as "objective." But the behaviourist
is, as he might say, "out for" objective treatment. Part of his
motive is to show the futility of subjectivism. Hence, for his

 BEHAVIOURISM

426 treatment, the emphasis falls on that of which one is conscious. Thus E. B. Holt would urge that there is nothing in the sub-
sistent or existent world (for our developed knowledge or our
more primitive acquaintance) of which we may not be con-
scious. For him therefore consciousness is a section through the
world of experience, of which section the organism that we speak
as of perceiving or conceiving is, in any given particular case, the
centrefield. And Woodbridge (1905) says: "Objects are con-
nected with consciousness in a way not to be lost by the
psychological theory of the mind. It is important to note that
while this is so, the knowledge is wholly determined in its content by the relations of the objects in consciousness to one another, not by the relation of con-
sciousness to the objects."

To be "in consciousness" is thus on this view to be in a field
of awareness which may, like space-time, be coextensive with
the universe. But this is not the only view—so much turns on
definition. Others, without invoking an independent psychic
entity, and without denying that there is a wide extent of
field of awareness, within which all objects for consciousness
are set, would differentiate consciousness as an imperium in
imperio and restrict it to the organism as the percipient centre
within that field. B. H. Bode (1917) goes further and advocates
a yet more restricted concept of consciousness according to
which some reference to the future is an essential criterion.
"Consciousness is behaviour that is controlled by the future."
There is much to be said for the contention that human con-
sciousness is the mental correlate of behaviour that is
controlled by anticipations of the future. James urged that with
every definite image "goes the sense of its relations, the
dying echo of whence it came to us, the dawning sense of what
it is to lead." But this is not quite what Bode says. He speaks
of consciousness as "just a future adaption that has been set
ready to work as so to bring about its own realization." This
implies that the locus of consciousness, thus regarded, is the percipient
centre. "As Dewey has pointed out, the psychical is correlated
with intra-organic adjustments within the organism, that is
adjustments of the organism considered not with reference to
the environment, but with reference to one another." This
seems to give to psychology, as commonly understood, a more
definite place than is readily to be found in the treatment of
Watson. And Yerkes (1917) criticizing the behaviourism of
Watson "as simply and solely the physiology of organic activ-
ity," claims that there is a science of "psychics" on a par
with that of "physics," including in the latter objective physi-
ology and biology. Enough has been said in this connexion to
show that it is no easy task to bring to a focus the essentials of
behaviourist creed or policy.

Apart from philosophical implications, and apart from its
relation, if any, to consciousness, a cardinal feature of this
policy is to start out from behaviour as that which lies open to
objective observation instead of from introspection, which is
supposed to yield some trans-empirical psychic force or energy.
Behaviour is the biological "end" of all processes in the organ-
ism; it is that which we seek to interpret under the canons of
strictly scientific procedure; it is therefore that from which
such interpretation should set forth. This, it is urged, has
been realized by all the best workers on the problems of animal
life; it has been realized in a measure by those who lay stress,
in human life, on the importance of conduct. Here the realiza-
tion needs to be widened and strengthened. Watson would
add that it must be formulated in physiological and biological
terms. In human life there is no doubt much emphasis on
language and on thought. What is language, however, but a
subtle mode of behaviour—"laryngeal behaviour"? if we include
all the contributory bodily processes which centre round oral
speech, and, as integrated therewith, the written word? How
large a proportion of human behaviour finds its expression in
language and its attendant modes of symbolization? But in
our adult life much of this has been rendered implicit and no
longer gets overt or explicit expression. None the less it is
present, as unvoiced "laryngeal behaviour," though "the
moment the overt slips into the implicit, instrumentation [the
use of delicate apparatus] becomes necessary to bring the process out for observation” (Watson). Even then it is difficult to interpret the data owing to much abbreviation and short-circuiting.

Now, many who would not care to be labelled behaviourists might provisionally agree that language, expressed or suppressed, is the outcome of thought. But this is not good enough for the physiological behaviourist. Language, behaviour and thought must be identified. Thus Watson contended that “I think is the action of language mechanisms.” It is not, as some assume, “something, no one knows quite what, that can go on in the absence of all muscular activity. It is a constituent part of every adjustment process. . . . It is not different in essence from tennis-playing, swimming, or any other overt activity except that it is hidden from ordinary observation and is more complex and at the same time more abbreviated.” If then thought is the action of the laryngeal mechanisms just as swimming is the action of other bodily mechanisms, it clearly follows that thought, for this behaviourist “psychology,” in which the word “consciousness” is taboo, is a mode of bodily behaviour. In what sense can this be accepted on behaviourist principles? Not without diffidence it may be suggested that to get the answer to this question it is essential to recognize that the organism responds as an integrated whole, and that all that follows on stimulation in some life-situation must be regarded as behaviour. Laryngeal behaviour is the outcome of the behaviour of effectors; their behaviour is the outcome of that of a nervous system with its inherited and acquired neuromuscular mechanisms. The behaviour of a larynx under adequate stimulation. All human conduct, including speech, overt or implicit, is the final expression of the behaviour of the organism, man, as a whole; and this organism is what it is, and finally does what it does as the result of all that has happened to it during development under the environmental conditions of life up to date. Watson seems to lay chief stress on what has been spoken of as the final expression—the business end of the whole business. And perhaps he would regard what has been said as involving an unwarrantable extension of the concept of behaviour. But there is much, even in his treatment, which lends colour to such an interpretation of that which he would regard as the cardinal policy of behaviourism.

The physiological story above outlined is a familiar one. Watson tells it admirably and adds effective and illuminating touches. He is honest in confessing that much still remains conjectural. One is left in wonder, however, why when the ship of psychology is lightened by throwing consciousness overboard, thought also should not be sikety dropped over the stern. Then the vessel thus rendered thoroughly seaworthy might be rechristened and given some more appropriate name under which to pursue her voyage. Psychology seems a misnomer.

The name is, however, retained. So let that pass. Revert to the emphasis on the final expression in act and deed. Here is a bit of sound policy. It is this final expression which is of prime importance in animal behaviour and in human conduct. Herein lies the pragmatic value of behaviourist treatment. Men have, for example, to be selected for vocational work, for service in the social community, as promising for this job or for that, on occasion as likely to be efficient in the army. They must be chosen for what they can do, and for what they will do, aurally and well. It is claimed, and there is evidence to substantiate the claim, that the behaviourist with his stress on the effective output in conduct, is able to make a wiser choice than the “orthodox” psychologist who is said to be obsessed with the older intellectualistic methods which involve too much reliance on the methods of introspection only—whose “pure psychology” is of slender value in its application to the current problems of busy life. In another field of practical application it is urged that the methods of behaviourism will be fruitful. Both Watson (1916) and Holt seek to apply them in the procedure of psycho-analysis; and the latter author interprets the Freudian Wish in terms of his special form of behaviourism and his relational treatment of consciousness. One may hazard the opinion that a judicious dose of behaviourist interpretation may serve as a corrective of some of the tenets of what now goes by the name of the New Psychology.

Of late years in England it is instinct in man, rather than in animals, that has occupied the attention of psychologists and sociologists. For this purpose the definition of instinctive is able to behaviour as that which is unlearnt—the form of which is not acquired in the course of individual experience, coming by nature and not through nurture—has been found not only difficult of application in human life but scarcely serviceable for marking a contrast which calls for emphasis. Instead therefore of using the word “instinctive” to mark those forms of behaviour which are unlearnt and not individually acquired, some use it to distinguish those modes of behaviour which take form unreflectively from those which are the outcome of rational thought under fully deliberate choice. Thus the instincts of the herd, those of the dog, of the cat—Trotter's Instincts of the Herd, in L. T. Hobhouse's Mind in Evolution, and in W. H. R. Rivers' Instinct and the Unconscious. For those who advocate a new psychology, this seems to be a pivotal concept in the increasing literature of psycho-analysis. Its spiritual father in this country is James Ward, whose article Psychology in the E.B., 9th Ed, marked a turning-point in thought. It has been fostered through the influence of Henri Bergson. It involves the concept of a "kind of causality so connected with the nature of conative consciousness that it can belong to nothing else" (G. F. Stout, to whose paper an important chapter on Instinct has been added, 1913).

If there is any validity in the characterization of behaviourism outlined above, this is the psychology which its supporters seek to supplant, since it involves, as they aver, a bifurcation of nature through the introduction of trans-empirical concepts. And assuredly those who hold this creed will, on their part, utterly reject behaviourism.

See J. B. Watson, "Psychology as the Behaviourist views it," Psych. Rev. xx., 1913 (to this article may probably be assigned the introduction of the word); Behaviour (1914); Psychology from the Standpoint of a Behaviourist (1920); E. B. Holt, The Concept of Consciousness (1914), The Freudian Wish (1915). See also Jour. of Philosophy, Psychology and Scientific Methods from 1904 to date. The dates in the text after the names of Bode, Weis, Yerkes and others refer to articles in journals and not to formal under the years of publication. W. James' "Does Consciousness Exist?" appeared in the first volume and is reprinted with other pertinent papers in Essays in Radical Empiricism (1912).

BELBY, SIR GEORGE THOMAS (1850— ), British physicist, was born at Edinburgh Nov. 17, 1850, his father being a physician. He was educated at Edinburgh University and trained as a civil engineer. When quite young he developed, in collaboration with the late William Young, a new method
of retorting oil shale, in which by carrying out the opera-
tion in two stages, each at the most suitable temperature, most of the fixed nitrogen in the spent shale, which had pre-
viously been lost, was obtained as sulphate of ammonia. Between 1881 and 1894 this method entirely displaced the older methods of retorting, and the industry was enabled to hold its own in competition with imported petroleum products. In 1891 Beilby invented and developed a new synthetic process for the manufacture of the cyanides of potassium and sodium, by the use of which gold and silver are recovered from their ores. The cyanides are produced by passing ammonia gas through a molten mixture of the carbonates of the alkalis with charcoal, at a temperature of about 1000° C. An improved form of British invention founded on this process, the first factory being opened at Leith in 1891. Beilby was elected F.R.S. in 1906. He was president of the Chemical Society in 1899, of the chemical section of the British Association in 1905, of the Institute of Chemistry in 1900-1, and of the Institute of Metals in 1916-8. In 1912 he was a member of the Royal Commission on Fuel and Engines for the Navy. During the World War he was a member of the Admiralty Board of Inventions and Research. He was knighted in 1916. He published many scientific and technical papers, and also The Aggregation and Flow of Solids (1911).

BELASCO, DAVID (1859– ), American playwright and manager, was born at San Francisco, Cal., July 25 1859. After graduating from Lincoln College, Cal., in 1875, he was stage-manager at several theatres and then went to New York where he owned and managed the prosperous Belasco theatre. He wrote or adapted some 200 plays, largely melo-
dramatic, and owing to his mastery of stage-craft he was eminently successful as a producer and stage director. He presented E. H. Sothern in Lord Chandley (1885); Mrs. Leslie Carter in The Heart of Maryland (1895); Blanche Bates in Noughty Aristocracy (1896); and Selden Knight Collinett in Sweet Kate Kildeer (1903); and David Warfield in The Music Master (1904).

Of his numerous other productions may be mentioned: May Blossom (1884); The Charity Ball (1887, with H. C. De Mille); Men and Women (1890); The Girl I Left Behind Me (1893, with Franklin Fyles); Madame Butterfly (1900); Madame Du Barry (1901); The Darling of the Gods (1902, with John Luther Long); The Girl of the Golden West (1903); The Return of Peter Grimm (1911); The Governor's Lady (1912); The Temperamental Journey (1913); The Secret (1914); A Celebrated Case (1915); The Boomering (1915) and Polly Trotter (1916 and 1917).

BELCHER, JOHN (1847–1913), English architect, was the son of John Belcher, an architect of some position. He prob-
bly derived much of his artistic faculty from his family connec-
tion with William Woollett, the 18th century engraver. Follow-
ing his father's profession, his education included a couple of years in Germany. He further made a lengthy stay in Paris, studying and sketching modern French architecture, the result of which asserted itself in his first important commission—the Royal Insurance offices in Lombard Street—a French Renaissance building (since pulled down) in which he introduced much sculptured work from the hand of Thomas Thornycroft. Joining his father in the latter's practice John Belcher, junior, two years later took possession principally, for the next 15 or 15 years, for business premises in the city and elsewhere. Amongst the earliest of these is the well-known block at the corner of Poultry and Queen Victoria Street, a building show-
ing strongly he was influenced at that period by the Gothic movement of which Street and Burges were the prominent exponents. After his father's retirement in 1875, Belcher asso-
ciated himself at various times with a succession of partners—J. W. James, Beresford Pite and J. J. Jous. His most important work was that resulting from his partnership with the last, and it evidences a monumental strength and dignity of design to which his earlier achievements had been leading. He was always and vividly always expressed admiration for Norman Shaw was a great factor in his artistic evolution, but even a more powerful one was due to the preparation and study involved in his production of the important volumes on The Later Renais-
sance in England, in which he was associated with Mervyn Macarney as joint author. His Electra House, Finsbury, and Whiteley's vast store, Bayswater, are admirable examples of business premises based upon plans thoughtfully and prac-
tically conceived, and possessing a fine and dignified architec-
tural treatment. Belcher was not responsible for many churches, but his Holy Trinity church, Kingsway (1900), is an interesting essay in the classic manner, and the Catholic Apostolic church in Maida Vale being on very similar lines, may compare with any of the Gothic town churches designed by Pearson. His domes-
tic work—especially that at Stowell Park for the Earl of Eldon —had much grace and charm, and evidenced his sympathy, natural, a With his own scale. Apart from his profession Belcher displayed considerable gifts as singer, composer and conductor. His talents received recognition in many directions and he was the holder of various distinctions in his own country and elsewhere. He was elected Royal Academ-
ic in 1909, and in 1907 received the gold medal of the Royal Institute of British Architects, of which he had been president in the preceding year. Russia, Belgium, Germany, Spain and the United States elected him a member of their several architectural societies. He died in London Nov. 8 1913.

BELGIAN CONGO (see Congo Free State, 6th ed.).—Readjust-
ments of the Congo-Uganda frontier, and the incorporation in 1919 of the greater part of Urundi and Ruanda, increased the area of the colony by some 19,000 sq. m., and its inhabitants by, approximately, 2,500,000 to 3,000,000. The total area of Bel-
gian Congo in 1920 was estimated at 928,000 sq. m. A census was taken for the first time in 1917. It was not complete but indicated that the pop. was little more than 7,000,000. In 1921, including Ruanda and Urundi the estimate was 15,
000,000. In 1918 white inhabitants numbered 6,487, of whom 3,307 were Belgians. British numbered (in 1917) 820, of whom 382 were soldiers. The number of Europeans increased from 24,000 in 1910, the capital of Katanga, had a white pop. in 1920 of about 1,600. It had many fine buildings and most of the amenities of a European town.

Trade, Agriculture and Communications.—The most striking development in the resources of the country from 1909 was the exploitation of the copper mines of Katanga. They were worked by the Union Miniere, in which British capital was largely interested. Since Dec. 1909 the mines had had a direct outlet by railway to the E. coast at Beira. The output of copper rose from 907 tons in 1911 to 4,134 tons in 1913 and 10,477 tons in 1920. The copper-bearing belt is about 250 m. long and from 25 to 50 m. wide: The chief mine is at Kambove and has been worked since 1913. The ore is smelted at Lubumbashi, where in 1919 there were seven furnaces producing 64,500 tons of copper a year. Up to the outbreak of the World War all the Katanga copper was bought by Germans; thereafter it was sent to Britain. Tin is also mined in Katanga, but up to 1921 little had been done to exploit its iron and gold deposits and diamonds. Since 1913, however, an extensive diamond field in the Kasai basin along the Angola border has been worked. The stones, averaging ten to a carat, are found in the river gravel or in alluvial deposits. The output was about 900,000 carats in 1917 and over 200,000 carats in 1920. The gold mines at Kilo and Moto, worked since 1905, had an output in 1918 of some 90,000 ozs. The gold is found in placer deposits. Next in importance to copper mining was the development of the palm-oil industry, which up to 1911 had been practically confined to the Mayumbu district. In that year the British firm of Lever Bros. obtained large concessions in the interior to develop the cultivation of the oil-palm and to erect factories on the spot for crushing the oil. The company set to work with energy and the result was seen in largely increased exports. In 1917 the export of palm kernels was 6,216,000 tons: In 1921 the figures were 22,391 tons and 3,852 tons respectively. Cocoa, rice and cotton were also increasingly cultivated and the fall in the value of the Belgian franc led to a greater demand for colonial goods, and the amount exported, 2,149 tons in 1911, being 8,719. In 1916.

The value of exports, about £6,500,000 in 1913, was about £11,000,000 in 1916. During that period rubber fell from being 77% to 18% in value of the total value of the produce of the country: While the quantity exported was £3,000,000—was about the same. From 1914 onwards the palm and palm kernels and coconut were the chief exports. A considerable part of the trade is conducted with French Congo, which had no direct communication with the sea except through Belgian Congo. The value of imports
fell from £5,300,000 in 1910 to £2,350,000 in 1914. It varied much during the war, but in 1918 it was not quite £2,000,000. In 1916, £3,200,000 in 1917 and £3,500,000 in 1918. Before the war 60 to 70% of the imports came from Belgium, which also took the bulk of the exports. During the war external trade was almost wholly confined to German trade which recovered a large part of the trade, though that with Britain continued much above pre-war figures and was worth £2,000,000 in 1919.

Considerable energy was shown in railway construction and by the pulling together of the Belgian railways and the steamer routes from the mouth of the Congo to Dar es Salam and Cape Town. A railway 168 m. in length from Kabalo, on the Lualaba, along the Longa to Bolobo, began in 1911 and was completed in 1915. The railway which connects at Sankania with the Rhodesian railways and runs through Katanga reached Elisabethville in Oct. 1910, Kambove, the mining centre, in 1913 and Kabalo, on the river Lualaba in 1915. The length of the Katanga line is 450 m. and it is of the standard South African gauge. From Chilongo, on the Katanga railway, the building of a line westward to the Ango-Kiango—about 400 m.—was in progress in 1921. This line is to link up with the Léopoldville railway and put Katanga in direct communication with Lobito Bay, thus reducing the distance to Europe, compared with the Bela route, by over 3,000 miles.

Progress was made in improving river and lake navigation. Kinshasa, on Stanley Pool, possessing better accommodation supplanted its neighbour Léopoldville as chief river port in 1915. In 1920 a port and ferry service from the Congo to Stanley Pool to supply the river steamers with petroleum for fuel and reserves capable of holding 8,000 tons of oil were built. In 1921 a seaplane service was started along the Congo river from Stanley Pool to So So.

Revenue.—Taxes on imports and exports, not exceeding the equivalent of 10% of value, direct taxation of Europeans, and a poll tax on natives, a tax in land, and a tax on natives' share in the exploitation of mines were the chief sources of revenue; the administrative services and interest on debt the largest items of expenditure. The abandonment of the trading monopolies of the old Contra Free State, and the taking over of its loans put a severe strain on the resources of the colony. Revenue increased from about £4,700,000 in 1909 to £5,390,000 in 1918. In each of those years expenditure was greater than receipts by sums varying from £400,000 to £1,000,000 and new loans had to be contracted. The public debt in 1919 was £349,000,000 francs. With the development of commerce, and especially of the Katanga mines—in which the colony had a two-thirds interest—the prospects of balancing the budget became good. A sum of £500,000,000 francs was raised in 1921 for public works.

History.—From the date of its annexation by Belgium (Nov. 15 1908) the country was placed under the control of a colonial minister responsible to the Belgian Parliament, which has modelled the administration much on the lines of a British Crown Colony. The abuses and misgovernment which accompanied the annexation were repressed as quickly as was possible. Most of the trade monopolies held by Léopold II. and his associates were abandoned and foreign trade was encouraged. The native or land tenure was thus automated and the security of land tenure—though ownership remained with the State—and the right to dispose of their own labour freely. Moreover in 1910 the natives were granted a measure of local autonomy; their chiefs were—for the first time—officially recognized and were entrusted with large powers. These powers had a tendency, however, to make the chiefs, at least those of minor importance, simply agents of the State.

Another step in decentralization was taken in 1912 by the subdivision of the former unwieldy territorial division and by the grant of wider initiative to the commissioners of the division. When it was found that the Government was too highly centralized and, in 1914, the various divisions were grouped into four provinces over each of which a vice-governor-general presided, aided by a consultative council on which non-official Europeans had seats. This left the governor-general, and the council of government free to deal with matters affecting the colony as a whole, including the preparation of the budget. The governor-general had, however, practically no authority in the province of Katanga, which, in 1916, except that it had no separate budget, became a separate colony. Its vice-governor-general exercised all the executive functions of the governor-general and corresponded directly with Brussels.

In general the new native policy was successful, though trouble arose from the difficulty, due to crippled finances, of securing an administrative personnel of the best type. Many of the old agents of the Congo State had to be retained. One of these officials in the Tanganyika region was in April 1912 sentenced to ten years' imprisonment for summarily executing 11 native prisoners, including 4 women and a child. But that the natives as a whole were satisfied was shown by their attitude during the World War. A column of about 600 men cooperated with French forces in the operations in Cameroon and other units aided in the defence of northern Rhodesia. An army of over 10,000 men was raised for service in the East African campaign. At the outset of the war Belgium had endeavoured—unsuccessfully—to preserve neutrality in her Congo colony, and the first act of hostility was committed by the Germans (see EAST AFRICAN CAMPAIGNS). In the result the northern-western part of German East Africa was conquered by the Belgian native troops (as described in the article on the campaign) and from Sept. 1916 to March 1918 a considerable area of that country was under Belgian administration. Of this area nearly all the province of Urundi and the greater part of Ruanda were permanently assigned to Belgium by an Anglo-Belgian agreement of Sept. 1919. This was a notable addition not so much to the area as to the resources and population of the Belgian Congo. Ruanda and Urundi are healthy, fertile, highly productive districts, thickly populated and great cattle-raising areas.

The agreement made Kivu entirely a Belgian lake. By a previous Anglo-Belgian protocol (May 1910) the Congo-Uganda frontier had been modified so as to give Belgium the western part of Albert Nyanza and in Feb. 1915 another agreement fixed the frontier between Albert Nyanza and the Congo-Nile watershed.

Baron Wahlis, the first governor-general under Belgian administration, was succeeded in May 1912 by M. Fuchs. In 1916 M. Henry became governor-general. On his retirement the Belgian Cabinet departed from precedent by choosing, Jan. 1921, as the new governor-general a man without previous colonial experience—M. Maurice Lippens, governor of East Flanders. M. Louis Franck, the Belgian Colonial Minister, paid a visit to the Congo in 1920. His visit coincided with a period of unrest both among the white civil servants and among the natives, due to the high cost of living. For some time the majority of the white officials were on strike, while certain native tribes rose in revolt.

See A Manual of Belgian Congo, a British Admiralty publication (1920); M. Hallewuyck, La Chartre Coloniale (3 vols. 1917-9); A. J. Wauters, Histoire Politique du Congo Belge (1912); E. M. Jack, On the Congo Frontier (1914); H. Waltz, Das Konsessionenwesen im neuen Konge (1917); F. Fallon, L'Agriculture au Congo Belge (1918).

BELGIUM (see 3.668).—On Dec. 17 1900, King Leopold II. of Belgium died at the castle of Laeken. He left behind him a Belgium richer and fuller of vitality than that to whose throne he had succeeded. His kingdom's immense economic development, which he had consistently aided and encouraged, had shown him the necessity for such a country, small but overpopulated, of ample foreign markets and colonies. Leopold I. had sought to foster the colonizing spirit in Belgium, but without success. Leopold II.'s eyes were opened by the great African discoveries of 1858 to the possibility of realizing an ambitious scheme of obtaining for his country's interests a vast territory in the centre of the Dark Continent. Amid general scepticism, and aided by a mere handful of men, mostly officers, he had built up the independent state of the Congo. From 1895 onward the Belgian Government had associated itself in his work by opening credits to him, although Parliament remained hostile to the King's bold and enterprising policy. Belgian finance, however, took an interest in affairs on the Congo; and little by little there developed a section of public opinion favourable to the taking over by Belgium of the immense African territory. After a violent agitation against the methods of colonial government in the Congo State, conducted in Germany, England, and America, and supported by certain Belgian politicians, the Congo was ced to Belgium in 1908.
King Leopold realized that if his country was to remain economically powerful its army must be strengthened, and to effect this was his constant preoccupation; but the Catholic parties, in power since 1883, always frustrated his efforts, and up to the time of his death Belgium still preserved her system of recruiting by drawing lots, conscripts who had been drawn having the right to get themselves replaced by substitutes at the cost of a fine of 1,600 francs. This system of substitution was abolished by the Chamber in 1909, and the King on his death-bed signed the law enforcing personal service.

Leopold II. had expressed a desire to be buried with the utmost simplicity, in the early morning, and without official ceremonies. The Government did not think fit to conform to these wishes, however, and arranged an imposing funeral. He was succeeded by his son and nominal heir, Prince Albert, whose consort, Elizabeth, had been born a duchess of Bavaria.

I. Pre-War Situation, 1910-4.—By Belgian constitutional law the heir-presumptive to the throne does not become king until he has taken the oath. Leopold II.’s death consequently entailed a temporary regency which, in accordance with Belgian law, was exercised by a Conseil de Regence composed of members of the Government:—T. Schollaert, L. de Lautheere, J. Davignon, J. Liebaert, Baron Descamps, A. Hubert, A. Delbecque, G. Hellepeste, J. Hellebrut, J. Renkin. On Dec. 23, in presence of the Chamber and delegations from the constituent bodies of the country, King Albert I. of Belgium took the oath of allegiance to the Belgian Constitution. The new King had already shown his intention to carry on his uncle’s work, having, while still heir-presumptive, made a journey to the Congo for purposes of investigation. But alongside that keen interest in colonial, economic, and military problems in which he resembled Leopold II., he also from the first showed anxiety for his kingdom’s intellectual development and social organization.

Belgium had indeed advanced considerably during the reign of Leopold II. She had not only achieved a high degree of prosperity, but had also undergone an intellectual renaissance, giving birth during the second half of the century to a school of writers, painters, and men of science worthy of comparison with those of the neighbouring countries. Furthermore, the development of trade, with its increase in the numbers of industrial workers—in 1910 they numbered 1,270,484—raised social problems with increasing urgency. Belgian trade had found immense markets, thanks in part to the cheapness of its products due to low wages. The growing strength of the trade unions enabled the workers to claim an improvement in their material conditions, and the Chamber began to feel itself embarrassed by the difficulty of entering on the path of social reform without compromising her economic stability. Political struggles of peculiar intensity were rendering the situation still more delicate. In Belgium social-and economic claims are always mixed up with purely political questions. Social and professional organizations are at the same time political groups, and their action makes itself as much felt in political affairs as in the economic sphere. In 1907 the trade-union movement was divided as follows:—

<table>
<thead>
<tr>
<th>Union</th>
<th>Members</th>

</tbody>
</table>

The socialist unions first tested their strength in the campaign opened by the Socialist party in 1912 for universal suffrage “pure and simple.” This campaign coincided with the violent struggle on the education question which began just then between the parties of the Left—Liberals and Socialists—and the Catholic party. The Catholics, who commanded a majority in the Chamber, introduced a bill to put the voluntary schools and the State schools on an absolutely equal footing. Education in Belgium, especially primary education, is largely in the hands of the religious denominations. Their schools, recognized and subsidized by the State, were in many communes the only teaching institutions. It was to these denominational schools that the Government proposed to accord the same treatment as that given by the State to its own official schools.

The proposal raised a storm of adverse opinion throughout the country. A monster demonstration organized by the Socialist and Liberal parties took place at Brussels. The Liberal party, rallying to the principle of universal suffrage at 25 years of age and the single vote, formed a bloc with the Labour party in order to oppose the Right, and they issued joint lists of candidates in most of the towns. The Catholic party, nevertheless, proved successful in the elections of 1912, preserving a majority in the Chamber.

These elections, maintaining in power a party that had governed uninterrupted for 28 years, had grave consequences. The Catholic party was strongest in the rural districts and in the small Flemish towns. The Walloon districts, more industrial in character, returned a large majority of Liberals and Socialists. On the morrow of the Catholic victory violence of party feeling, much exacerbated by the new Education Act, led to an outbreak of rage and indignation in the more politically advanced parts of the country. In certain Walloon circles there arose the idea of the administrative separation of Flanders from Wallonia. Flanders should remain Catholic; the Walloon country should be free to have the advanced (Left) Government it desired.

This movement, combining with that concerned with the language question, threatened serious results. “Flammanisme,” which originated in democratic aspirations, seeking to bring together Walloon and Flemish in a common Belgian body, thought that the French-speaking bourgeoisie, had little by little—obessed by its dominant idea and by a sort of regionalistic mysticism—turned towards reaction. The language question had been dealt with by various laws—that of 1878 regarding the use of the languages by public authorities; that of 1881 about the publication of laws; that of 1910 on free secondary education; and by the laws of 1913, on the use of the languages in the army, and of 1914, on primary education, which were designed to complete the legal equality of the Flemish language with the French. Yet in the hearts of a minority, a desire was shaping itself to expel the French language.

In 1913 a bill was introduced in the Chamber proposing the division of the army into Walloon and Flemish units, but was defeated by an immense majority. This did not deter three deputies—a Catholic, a Liberal, and a Socialist—from proposing to the Chamber in 1914 the Flamondisation of the university of Ghent, in which French was the official language.

The Government did not perceive that by pursuing a course of purely party politics they were stimulating the growth of this separatist movement, and despite the protests of the Left they overrode the four brave men who were left to confront their Government in their struggle, which they had temporarily abandoned. To counter this, and to force upon the Chamber the adoption of the universal suffrage “pure and simple” which they demanded, in April 1913 the Socialist party organized a general strike, which spread over the whole country, involving many hundreds thousands of workers. The Government would not yield, however, and their Education Act became law. If in this the Catholic party had gained an undeniable victory, it had been at the price of adopting compulsory education, which for many years past had been advocated by the Liberals. It was now enforced by the laws of May 19 and June 15 1914.

Educational System.—School attendance is obligatory from 6 to 14 years of age. The juge de paix has to admonish recalcitrant parents; and if they persist in neglect of their duty, they are first officially warned before the final steps are taken of the infliction of a fine and the posting of their names in their commune. By the law of May 9 and June 15 1914 each commune must possess an official school. One or more voluntary schools, if such exist in the district, may be “adopted”; but if this is done a communal school must still be provided, supposing it is demanded by a sufficient number of the inhabitants to ensure it an effective minimum attendance of 20 children. In all schools, whether official or adopted, the teachers must be Belgian and French-speaking. The State inspects both communal and adopted schools, and they receive grants from the central authorities of province and commune. Education is free, and the necessary books and appliances are provided free for poor families. The syllabus of primary schools includes reading, writing, arithmetic, weights and measures, the language used by the majority of the local population, geography, history of Belgium,
Belgium's efforts to develop the technical training of her population increased steadily during the last few years before the war, much being done in this way by the provinces and communes. Hainaut (Hainaut) organized an admirable centre of technical instruction at Charleroi under the name of the Université de Travail. Further, Belgium's technical education comprises not only the teaching of finished trades, but to its credit, the training of industrial apprentices, with their technical and other courses of instruction.

**Population.**—A population which in 1910 numbered 6,903,458 had in 1910 become 7,423,782—an increase of 10-91 % or over 1% per annum. Density increased from 227 to 252 inhabitants per sq. km. By 1913 East Flanders contained 374,511,688 km, the province of Antwerp, 342,217,331, the province of Liége, 306,606,270, Limburg, 114, the province of Namur, 99, Luxembourg, 36, Hainaut, 89, and Brussels, 71, in which are distributed most remarkable resources of the country. Such efforts made by public authorities, more especially by the provincial and communal administrative bodies, whose powers are very extensive, are rendered necessary by the social conditions of the central part of the country.

**Industries.**—The various industries of Belgium employ a large part of the population. In 1910 this industrial population comprised:

<table>
<thead>
<tr>
<th>Industry</th>
<th>Persons Employed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Employers or employees employed in 250 or more machines</td>
<td>260,000</td>
</tr>
<tr>
<td>Members of families as such</td>
<td>91,993</td>
</tr>
<tr>
<td>Employers</td>
<td>8,463</td>
</tr>
<tr>
<td>Workers</td>
<td>1,700,161</td>
</tr>
</tbody>
</table>

These were divided among the different branches of industry as follows:

<table>
<thead>
<tr>

In 1914 glass-making employed 12,000 workmen, maintained 19 furnaces and produced annually 400,000,000 francs worth of glass, or one-fifth of the world's central output, 95% being exported. The unchallenged superiority of the Belgian glass-workers, with their centuries of specialization behind them, ensured a privileged position in the markets of the world. Even so, technical development was necessarily limited and successfully introduced. By means of it glass is drawn without being touched by hand from the moment it comes out of the furnace until it is finally fired and cooled. The glass factories, producing annually 2,500,000 sq. metres of plate glass, representing a value of 28,500,000 francs, nine-tenths being exported; and the factory of Junet produced annually 12,000,000 bottles. The Belgian glass works, including those of the Vlaamse St. Lambert, with 5,600 hands, produced daily 250,000 pieces, an output (90% exported) realizing annually 13,000,000 francs.

In 1915 the metallurgical trade included: 21 large furnaces with 20,000 hands, producing 66,000 tons of cast iron; 19 blast furnaces, with 7,700 hands producing 1,134,000 tons of rough steel and 671,000 tons of finished products; 15 iron-works with 3,402 hands producing 107,000 tons of steel, and 61 converters producing 274,450 tons of rough steel; 84 converters producing 2,100,180 tons of rough steel and 1,090,000 tons of finished steel; 38 transformers producing 203,530 tons of finishing iron and 44,090 tons of finishing steel.

The iron industry was augmented by 14 foundries with 600 hands and 10 rolling-mills, and produced annually 200,000 tons of rough steel and 50,000 tons of material for the manufacture of steel pipes.

The manufacture of steel, the steel industry, including coke-fired furnaces, employed in 1913 a total of 30,500 hands, and was represented by 41 factories with 2,508 coke-fired furnaces, employing 4,229 hands and producing 3,523,000 tons; 19 works with high furnaces, 5,299 hands, producing 2,284,900 tons; 28 Siemens-Martin furnaces producing 274,450 tons of rough steel; 84 converters producing 2,102,180 tons of rough steel and 1,090,000 tons of finished steel; 38 transforming plants producing 203,530 tons of finishing iron and 44,090 tons of finishing steel.

The citron industry possessed 14 foundries with 600 hands and 10 rolling-mills, and produced annually 200,000 tons of rough steel and 50,000 tons of material for the manufacture of steel pipes.

Belgium's commerce was as flourishing as Belgian industry. Facilitated by a network of ways and communications comprising 2,000 km. of water-ways (67 m. per sq. km.), 4,653 km. of broad-gauge railways (158 m. per sq. km.), 4,107 km. of narrow-gauge railways, 9,651 km. of main roads, and 32,000 km. of local roads, import and export trade and transport were intensely active. Belgium's free-trade policy largely contributed to her commercial prosperity. In 1913 the import duties affected only 16.5% of import value. They were, moreover, extremely light, in 1900 representing 2.3% of the value of imports, in 1910 1.6%, in 1913 only 1.4%. It is true that a movement was already beginning towards the imposition of duties to check the dumping practised by certain foreign industries, or to induce other nations to admit Belgian goods freely; but this was merely a defensive policy, rendered necessary by that of foreign states.

Commerce. - Belgian commerce was as flourishing as Belgian industry. It was facilitated by a network of ways and communications comprising 2,000 km. of water-ways (67 m. per sq. km.), 4,653 km. of broad-gauge railways (158 m. per sq. km.), 4,107 km. of narrow-gauge railways, 9,651 km. of main roads, and 32,000 km. of local roads, import and export trade and transport were intensely active. It is true that a movement was already beginning towards the imposition of duties to check the dumping practised by certain foreign industries, or to induce other nations to admit Belgian goods freely; but this was merely a defensive policy, rendered necessary by that of foreign states.

Belgium held the sixth place in the world. The total figures of her import and export trades, not including goods in transit, rose as high as 8,765,673,061 francs. In 1913 this total was composed as follows:

<table>
<thead>
<tr>
<th>Imports</th>
<th>Frans.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live animals</td>
<td>60,273</td>
</tr>
<tr>
<td>Beverages and foodstuffs</td>
<td>1,043,922</td>
</tr>
<tr>
<td>Raw materials and goods</td>
<td>2,663,952</td>
</tr>
<tr>
<td>Gold and Silver</td>
<td>800,478</td>
</tr>
<tr>
<td>Manufactured articles</td>
<td>412,251</td>
</tr>
<tr>
<td>Total</td>
<td>8,765,673,061</td>
</tr>
</tbody>
</table>

Between 1900 and 1913 Belgian trade had doubled, marking the greatest rate of progress it had ever achieved.

The following table analyzes the elements of the import and export trades:

<table>
<thead>
<tr>
<th>year</th>
<th>Imports (millions of francs)</th>
<th>Exports (millions of francs)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1910</td>
<td>851,404</td>
<td>829,456</td>
</tr>
<tr>
<td>1911</td>
<td>777,501</td>
<td>895,773</td>
</tr>
<tr>
<td>1912</td>
<td>875,314</td>
<td>864,751</td>
</tr>
</tbody>
</table>

The bulk of the imports consisted of foodstuffs and raw materials. Exports were chiefly manufactured articles and materials which had been subjected to a simple process. In 1913 the trade was chiefly with the following countries:

<table>
<thead>
<tr>
<th>country</th>
<th>imports (millions of francs)</th>
<th>exports (millions of francs)</th>
</tr>
</thead>
<tbody>
<tr>
<td>France</td>
<td>1,100,297</td>

</table>

It is interesting to note that 87.4% of goods in transit travelled by sea, 12.5% by road. Exports, as well as imports, had demonstrated a considerable importance to the port of Antwerp, the foreign hinterland.

Marine trade was served by the ports of Antwerp, Ghent, Ostend, Zeebrugge and Nieuport. The total tonnage of Belgian ports amounted to 15,101,712 tons in 1911, to 16,353,613 tons, and in 1913 to 16,007,417 tons, Antwerp taking first place. The details are as follows:

<table>
<thead>
<tr>
<th>year</th>
<th>Number of vessels</th>
<th>Tonnage</th>
</tr>
</thead>
<tbody>
<tr>
<td>1910</td>

In 1913, out of 61,500,000 tons of total imports and exports, 23,569,000 tons passed through Antwerp. The public authorities had devoted ceaseless attention to the development of and the improvement of Antwerp, and at the outbreak of the war it was one of the finest ports in the world, possessing 5,500 metres of river-side wharves, 19,000 miles of water-docks, 392 cranes of 2 tons, 8 cranes of 15 to 20 tons, 12 pneumatic floating gravel excavators, one electric coal-weigher, one barge for ore. The Entrepôt Royal could accommodate 100,000 tons of goods; the granary store had a capacity of 50,000 tons. Numerous private stores and warehousings, a close network of railway lines, and six great dry-docks completed the equipment of the port.

Agriculture. - Belgian agriculture was no less important than Belgian commerce and industry. In 1913, the value of its products amounted to two billions of francs. Agriculture was carried on at a high degree of intensity. Of the 2,945,000 hectares which constituted the territory, 1,950,000 were in cultivation and pasture, among a population of nearly 7,800,000. The cultivable area per head of population was only 25 acres (in France 100 acres, in Great Britain 45 acres). Belgium, therefore, could not be self-supporting. She was importing 1/3 of her consumption of corn. Other foodstuffs were produced in almost sufficient quantity, thanks to scientific specialization. In 1914 stock-breeding produced 300,000 tons of meat, 40 kg. per head of population per annum. Of sugar, potatoes, cattle, and eggs, the country was self-sufficient. Of barley, oats and potatoes she also exported more than any other country. The area of cereal cultivation was not very extensive: 750,000 hectares, about 1/8 of a total of 7,800,000 hectares of the land. Permanent pasture represented only 26% of cultivable land (65% in England); while on the other hand plants used for industrial purposes, root-crops and forage-crops which yield a much higher return in money, were largely cultivated.

Thus industrial crops occupied 950,000 hectares; forage, 292,000 hectares; orchards, 65,000 hectares; market gardens, 27,000 hectares; horticulture, practised especially in the environs of Brussels and Ghent, occupied 100,000 hectares, and provided a considerable export. As regards breeding, the export of Flemish horses brought in 20,000,000 francs.

The Army. - Fully occupied with her economic development, and consequently absolutely in the neutrality which was supposed to be her safeguard, Belgium was giving no real thought in these years to defence. The Liberal party alone stood for the principle of universal military service. The Catholic party had always from electoral points of view opposed the idea of military service. The King, however, well informed on the international situation, never ceased to press for improvement in the country's military condition. In 1912 M. de Broqueville, then head of the Government, succeeded, despite his party's reluctance, in passing an Act establishing the principle of universal military service. In 1913 a complete reorganization of the army was voted. Having obtained the necessary credits for the reorganization of Antwerp, Baron de Broqueville got several bills passed and promulgated numerous orders bestowing extended powers on the general military staff; creating a Supreme Council of National Defence (Conseil Supérieur de la Défense Nationale); establishing schools of artillery, cavalry and military engineering; reorganizing the Ecole de Guerre and the École Militaire; creating inspections générales of infantry, cavalry and commissariat; and considerably improving the equipment. These reforms were to be completed as a whole in five years. Already, however, the effective forces were augmented in number; the inclusion of all social classes in the army made it truly representative of the nation; and before the war mobilization was prepared; confidence was at last felt in both officers and troops.

Such was the situation when suddenly the army found itself called on to the stage of war, to confront alone the formidable hosts of Germany.

II. THE WORLD WAR, 1914.-On Aug. 2, 1914, the German Minister at Brussels handed the Minister for Foreign Affairs an ultimatum requiring him to permit the German troops to pass through Belgian territory, and to use the citadels of Liège and Namur for the purposes of their operations against France. A belated appeal to the German Emperor was made, but without success. Belgium, therefore, was left in a position of destitution and defence was prepared; confidence was at last felt in both officers and troops.
being reserved for the defence of the fortresses. Loyal to her international obligations, Belgium had disposed her forces so as to defend all her frontiers. The first division kept watch in England’s direction; the third confronted Germany; at Namur the fourth defended the entrance of the Meuse Valley; while the fifth, concentrated in Hainault, guarded the French frontier.

Germany’s ultimatum showed on which side danger lay. Yet the Belgian Government, wishing to sustain to the last moment the part assigned to it by the treaty of 1830, still refused the support of France. It was only when Germany’s intention to cross her territory became evident that Belgium informed the nations who had guaranteed her neutrality that she assumed the defence of her fortresses, and that she declared herself ready to cooperate with the Powers in maintaining the integrity of her territory. The third division of the army, under General Leman, was charged with the defence of Liége; the fourth division held Namur; the bulk of the army was massed in the centre of the country, covering Brussels and the lines of communication with France, so as to be prepared for all eventualities.

The Government had convoked the Chambers for Aug. 4 on grounds of urgency, and the King had announced his intention of making the speech from the throne. On the morning of Aug. 4 the King, accompanied by the Queen, proceeded to the Parliament House, in the midst of great popular enthusiasm. His speech affirmed the country’s definite decision to offer the enemy an unyielding resistance. The Chamber greeted these words with three cheers. After the departure of the King, who proceeded immediately to G.H.Q., Biron de Chambois, as head of the Government, read the note just sent by Germany to the Minister for Foreign Affairs, expressing her intention “to execute, if necessary by force of arms, the measures of security rendered indispensable in view of French menaces.” Parliament unanimously accepted war with all its consequences. M. Van der Velde, leader of the Socialist party, announced that his group would support the Government unreservedly. All parties rallied round the King. The Government, moreover, ceased to be a party-government, M.M. Goblet d’Alviella and Hymans, leaders of the T.L., left, and M. E. Van der Velde being appointed Ministers of State.

The Chamber at once set to work on the measures of law necessitated by the situation. Suddenly M. de Broqueville rose to read a telegram announcing the violation of Belgian territory by the German army. The deputies from Liége and its neighbourhood informed their colleagues of the news that their districts had been brutally invaded and occupied; and at once departed for their constituencies, to afford help and protection to the suffering inhabitants. As hour by hour the invasion of Belgium proceeded, the Chamber continued to pass laws delegating its powers, in the event of the invasion of each locality, to the local authorities; augmenting the contingent of the army; granting the Government a preliminary credit of 200,000,000 frs.; penalizing crimes and offences calculated to endanger the safety of the State; cancelling the ineligibility of soldiers for membership of Parliament, in order to permit the immediate enlistment of several members.

The spirit of the country was the same as that of the Chamber. Volunteers were besieging the recruiting-offices. In two or three days 40,000 had been equipped, and tens of thousands, still in their civilian clothes, had been dispatched to the camps for volunteers that were being formed in all directions.

A series of regulations were issued by the Government intended to prevent food-hoarding and the raising of prices, and to assure the food supplies of the nation. Bread was rationed at 400 grammes per head per day; in Sept. this ration was reduced to 250 grammes. Maximum prices were fixed for bread and the various kinds of flour. The right of requisition was given to governors of provinces for bread and flour; to burgomasters for potatoes, salt, sugar and rice; in the event of the invasion of a province, the governor’s powers of requisition passed to the commissaires d’arrondissement, in the case of their retreat to the burgomasters of the communes.

At the Ministre de l’Intérieur a Central Commission was formed, consisting of one delegate for each province, with representatives of the central administration and of the army, its duty being to see to the sharing-out of the food supplies among all parts of the country. In each province the députation permanente (standing committee) of the provincial council was made responsible for the vitiualising of the province, and to form committees in the communes to distribute provisions. Each week a return of all the food in the province had to be made by the députation permanente.

To ensure the proper working of this great system of food control and distribution, newly created in every detail, penalties were decreed for anyone trying to withhold goods from requisition; such hoards were to be confiscated and handed over to the Bureaux de Bienfaisance.

While these regulations were framed to safeguard the nation’s economic life, its administrative life was being safeguarded in the event of enemy occupation by the measure passed by the Chamber on Aug. 4 providing for the delegation of powers, which was supplemented later by various royal decrees. Notices were posted in every commune of the country, warning the public that civilians were definitely forbidden to take part in operations of war, and that all arms must at once be given over into the hands of the authorities.

The Invasion.—During the night of Aug. 3-4 the German army crossed the Belgian frontiers. It immediately put into practice a system of terrorism in its dealings with the inhabitants, hoping in this way to terrorise the Government, demoralise the army, and break the national resistance.

The forward march of the German army was marked by an uninterrupted succession of atrocities. Once it was perceived that the Belgian army meant to offer a resistance on which Germany had not counted, pillage, burnings, and massacres began.

On the pretext that the inhabitants were armed, that francs tireurs attacked the German troops, the invading military command methodically organized the devastation of the country. Maps were issued to the officers indicating what towns and villages were to be burned down. The siege of Liége, with the preliminary repulses suffered by the German regiment which first attacked the outer forts, gave the signal for a campaign of reprisals directed against the civil population. The villages of Berneau, Mouland, Blegny-Trambleur, Barchon, Melon, Soumagne, Romsecé, Harcourt, Herbécourt, Heure le Romain, Vivegnies, Julemont, Olne St. Hadelin, Battice, Grivegnée, Sprimont, Erneux, Francorchamps, and the towns of Visé and Herve, were burned to the ground, although they had been occupied for several days by the German army. Scenes of indescribable savagery were enacted: 623 persons were shot, massacred, or driven with blows of the rifle-butt into the flaming houses to be burnt alive. At Melen 72 men chosen haphazard were shot en masse, and finished off by blows with the butt-end under the eyes of their wives and children, who were then ordered to bury them at once. At Soumagne 55 men were shot by the firing-party detailed for executions, while the soldiers perpetrated shocking massacres of men, women and children in the village. At Visé, after the massacre of more than 20 persons, 631 men were led away captive. Not a single village escaped the fury of the troops; everywhere there was a reign of fire and sword. The burnings were scientifically organized. All units were provided with incendiary positions, and the army generally proceeded to destroy the houses, where more than 300 houses were burned, German inscriptions written by the troops revealed that the abominable deed had been performed by the “Incendiary Army of Düsseldorf.”

The entry of the German troops into Liége was marked by tragic incidents. Although the town was completely in the invader’s hands, on Aug. 7 German companies suddenly opened fire in the most frequented quarters, where they also set fire to 38 houses, shooting down the inhabitants as they tried to escape. Fifty-two persons perished in the flames or fell by the German bullets.
Between Aug. 4 and 20, in the province of Liège alone, 1,061 persons were massacred, shot, hanged, or burnt by the German troops; more than 2,000 houses and 4 churches were burnt deliberately and by order, not counting those destroyed by bombardment. In the province of Liège during the same period 65 persons fell victims to similar cruelties.

Liège having been occupied, the German army advanced up the Meuse Valley, and at the same time invaded the province of Luxembourg. The first French contingents now joined the Belgian troops in the neighbourhood of Dinant, Namur, and Arlon. Everywhere advance-guard fighting was delaying the enemy's progress and every skirmish was followed by cruel reprisals on the civil population.

The siege of Namur began on Aug. 24, and was the signal for more butchery. On the eve of the attack on Namur scenes of horrible sanguinary reprisals were enacted in the towns of Andenne, Seilles, and Landen. Without having received the faintest provocation, for three whole days the German troops in occupation of these places never ceased massacring and burning. More than 350 persons perished. These scenes of horror, accompanied by the burning of over 150 houses, culminated on Aug. 27 in the execution of numbers of men, by order of the military authorities. They were shot en masse, and finished off with the bayonet or the butt-end, or by kicks. The whole canton of Andenne suffered similar horrors; nine persons were murdered by the German soldiers after submission to horrible tortures.

Other localities suffered as cruelly. At Spontin 130 of the 160 houses that composed the village were burnt and 43 persons were massacred. At Somme-Leuze, Franc-Waret, Leuze-Longchamps, fire and murder reigned. Scarcely had the tragedy of Andenne been finished when the small town of Zamines was the scene of a yet more terrible drama. After skirmishes with Belgian and French advance-post, the Germans, who had fought pushing a screen of civilians in front of them, made the civil population responsible for their losses. All the men were first shot up in the church, and then massed in a field, and on the word be given by the military commanders they were shot down by machine-guns. Some were finished off afterwards, chiefly by stretcher-bearers of the Red Cross; 383 men perished, about 100 were wounded, only 200 escaped. The town was burnt to the ground. The whole canton was subjected to horrible atrocities; in the neighbouring villages 114 men were killed by German troops and 567 houses burnt.

Just at the time of the fall of Namur, the German military at Dinant organized an appalling demonstration of terrorism. The town had been occupied on Aug. 22 after some hard fighting with French troops. At nightfall on Aug. 23 German soldiers rushed shouting about the streets, and everywhere fires broke out. The church, the town hall, the entire town were soon in flames. The inhabitants, arrested en masse, were either massacred, or else driven into different enclosed places where, after a while, a methodical extermination was commenced. In the presence of their families men were formed into groups and shot; 665 persons were killed, including 75 women and 35 children. This horrible butchery was copied in the neighbouring villages. All of them were partially or completely burnt, any men found— the inhabitants had taken to the woods— were shot; at Anhère and elsewhere the same men were executed. In the cantons of Dinant, Walcourt, Florenville and Grimay 96 persons were put to death; and besides the whole town of Dinant and two entire villages—Outraye and Sorrines—1,732 houses and seven churches were destroyed.

On Aug. 23 the German troops entered Namur. Warned of the massacres by frightened peasants who had come fleeing before the enemy, the inhabitants abstained from any demonstration of feeling. The entry of the victorious army was devoid of incident. Yet suddenly on Aug. 24 a violent fusilade rang out in the streets, to continue all that day and all the next. The bishop, Mgr. Heylen, proceeded to the German headquarters to protest against this useless cruelty. He was arrested. After two days the terror ceased; 75 persons had fallen, 15 of them women and 4 children. The town hall, the communal archives, and 110 houses had been burnt down. In the villages surrounding Namur, also, the same brutal work had gone on; between Aug. 23 and 26, 53 men were butchered and over 200 houses burnt.

While thus in the province of Namur 1,949 inhabitants were murdered, and more than 3,000 houses systematically burnt (not counting those destroyed by ordinary acts of war), the province of Luxembourg in its turn was suffering martyrdom. From Aug. 17 onward, wherever the enemy appeared in Luxembourg, atrocities followed, those at Rossignol, Arlon, Zultigny, Ethe, and Lauter being sadly notorious. All these massacres were reprisals for engagements with the French forces. After the battles of Aug. 22 wounded soldiers found in the cantons of Virton and Etalle were killed, and the civil population hunted down in reprisals. At Andenne on Aug. 24, 34 men were hanged, then shot. At Lauter Prince Oscar of Prussia presided in person over the execution of 77 inhabitants. At Ethe 218 persons were killed. The inhabitants of Houdemont, warned of the fate which awaited them, escaped massacre by flight; of them were found by the Germans and put to death. At Touches the burgomaster was hanged; at Zultigny 84 men were executed; at Rossignol, after the village had been set on fire, all the men were collected together and driven as far as Arlon, where 165 of the poor wretches were shot in cold blood. During the month of Aug. over 850 inhabitants of this province perished, and over 1,500 houses were deliberately destroyed.

While the German army was dominating the Meuse Valley by the seizure of Namur, it was at the same time working towards the heart of the country to assure a route for the invasion of France. The Belgian army, after its victorious stand at Harlen on Aug. 12, isolated, unsupported, menaced by 11 enemy army corps, was now forced to fall back on Antwerp.

On Aug. 19 the German army entered Louvain. Just as Viseé had been burnt to terrorize the Liégeois, and Andenne and Dinant to bring about Namur's submission, so Louvain had to be burnt in order to hold a terrible example up to Brussels. When the German army was in effective occupation of Louvain, menaced with no further trouble, orders were suddenly given to burn the centre of the town. The inhabitants were subjected to cruel mental torture. The men were collected and decimated, 70 being shot in the presence of their wives and children, while 334 others were sent captive to Germany, where they were paraded through the streets of Cologne under the insults and threats of the populace who pelted them with mud and stones.

Louvain's cathedral of St. Pierre was1 devoured by the flames, her ancient university and marvellous library were annihilated, and 1,120 houses were burnt. The suburbs suffered likewise. In that canton 1,737 houses were burnt down, 367 houses pillaged, 226 inhabitants shot, and 653 deported to Germany. Aeroshot was reduced to ashes, and 178 of its inhabitants were killed.

Enraged by the opposition they met within the environs of Tirlemont, and by the sorties of the Antwerp garrison, the Germans vented their fury upon the numerous villages of Brabant, 594 inhabitants of which perished in the course of burnings, pillagings, and executions.

On Aug. 20 the German army entered Brussels. The entire Belgian army was massed under the protection of the forts of Antwerp. Sorties were made on Aug. 25 and 26, and Sept. 14. In that canton 1,737 houses were burnt down, 367 houses pillaged, with the object of diverting pressure from the French army, which was fighting on the Marne. Forced to protect itself from the Belgian army's perpetual attacks on its rear, on Sept. 28 the German army commenced the siege of Antwerp. On Oct. 6, after the destruction of the forts, the Belgian army retreated; and on Oct. 10, having eluded capture by the enemy, it took up position on the Yser.

The siege of Antwerp brought yet more fire and carnage. Over 160 persons in the fortified zone fell victims to the German soldiers. The town of Tervuren, where the Belgian army again and again successfully opposed the crossing of the Scheldt by the German troops, was at last taken, and was then burnt to the ground.
The province of Hainault did not escape. At Charleroi, after the great battle which took place there, 188 persons were massacred, at Marchienne au Pont 75, at Mons 39, at Tournai 34, at Châtelet 67. In the other villages through which the enemy forces passed, 782 persons were put to death.

It remains to mention the massacres perpetrated by the invaders in East and West Flanders. For these provinces, however, precise figures cannot be quoted, the work of compiling the lists of victims not being yet completely terminated.

The Occupation.—Brussels once in her power, Germany began to organize the occupation of the country. The activities of the government of occupation—headed successively by von der Goltz, von Bissing, and von FalkenhAUSEN—were considerable in all spheres. Always the same main policy emerged: in matters political, economic or social, the one aim of Germany was to make Belgium and all her resources serve the needs of the war; while preparing for her annexation—at the very least—her absorption—in the event of the German victory, and rendering her in any case innocuous as an independent nation by effecting her economic ruin.

The governor-general formed round him a central government, in which the Zivilverwaltung (civil administration) played the chief part. Executive powers were in the hands of the governor-general, who legislated by promulgation of orders. A German governor was placed over each province. The Belgian commissaries were deprived of their authority over the arrondissements, being replaced by Germans, subordinate to whom were the military commandants, to whom, in the event of a colonial conflagration, the country was divided into the Government General, placed directly under the authority of the Zivilverwaltung; and the Zones d'étapes, including Flanders, the arrondissements of Tournai and Mons, and the southern part of the province of Luxembourg, governed by the military authorities, who had the right of promulgating orders. These Zones d'étapes were completely separated from the rest of the country. Access to them and exit from them were forbidden without permits, which were not readily granted.

Everywhere bureaux de contrôle were established to keep a watch on the habitants, persons placed under their special surveillance being obliged to report there annually. A network of espionage was spread over the country, enabling the authorities to know what citizens were dangerous, or even simply too influential, so that they might be regarded with suspicion, and arrested on the first pretext.

Not only was the Belgian administration completely deprived of executive power, but the powers of the provincial councils were gradually undermined. In 1915 the right of meeting in ordinary session on fixed dates was taken from them, while the dépétations permanentes (administrative bodies appointed by the provincial councils from among their members) were placed under the direct authority of the presidents of the German provincial civil administration. Still further, from 1917 onward these presidents in each province were authorized to assume themselves the powers of the provincial councils as regarded the receipts and expenditure of the annual budget, and the methods of raising the necessary funds to meet the expenditure. The struggle between the provincial councils and German authority became bitter indeed when the governor-general claimed their collaboration in assessing liabilities for the enormous war-tax—varying between 40, 50 and 60 million francs per month—with which he had saddled the country. Nearly all the provincial councils in East and West Flanders, preferring to accept an arbitrary assessment decreed by the government of occupation, rather than to yield a semblance of legality to its decisions. Henceforward the military governors, and also the German presidents of civil administrations, were empowered to ensure the payment of the tax, and to that end had the right of raising loans in the name of the province. On July 6 1918 the provincial councils were definitively suppressed. Nothing then remained of the Belgian administrative system.

In vain, however, did Germany destroy the machinery of the country's self-government; she could not break the spirit of the nation. The glorious example set by men like M. Visart de Bocremé, burgomaster of Bruges, who at 80 years of age stood up fearlessly to the German military power, or like M. Max, burgomaster of Brussels, who boldly led the resistance of his townsfolk, going so far as to post on the walls an official contradiction of the news published by the Germans concerning the march of military operations, from the earliest days of the occupation sufficiently indicated to the invaders what the public attitude was going to be. M. Max, when arrested and sent to Germany, there to be subjected to a system of reprisals, had for successor M. Lemonnier, whom in his turn the Germans were obliged to arrest and deport. In every class of society acts of admirable devotion occurred. Hundreds of Belgians were deported to Germany or shot. Names such as those of Gabrielle Petit, Philippe Baucq, the Englishwoman Edith Cavell, J. Corbíser, Louis Neyts, Bodson, Le Grand, Lenoir and many others stand for the heroism of an entire population.

Neither deportation nor executions could ever prevent the spying on behalf of the Allies carried on by thousands of Belgians, nor the publications of a secret press which fought energetically against the occupant power. On Feb. 2 1915 La Libre Belgique appeared. Each week until the Armistice it was published and distributed throughout Belgium. At Louvain the Revue de la Presse gave the most interesting extracts from the Allied press. In Brussels L'Amé Belge made vigorous political propaganda, continuing to appear despite the arrest and imprisonment of its editor. In 1916 Le Flambeau, by the method of analyzing foreign politics, taught the public the way to expect victory. At Ghent L'Aute Câche stood firm against the Germans and against Amendments did De Vrye Steren, at the head of their journals, directed by secret committees of priests, lawyers, university professors and journalists, other smaller papers, appearing less regularly, such as La Soupe, Le Belge, Ca et La, Patrie, and De Vleemische Leeuwen, sustained Belgian patriotism.

German Legislation.—German legislation was abundant, more especially that of a repressive type. The most trivial regulations carried penalties of extreme severity. Maximum prices, requisitions of bread and cereals, were enforced by penalties extending to five years' imprisonment and a fine of 20,000 marks. Such Draconian measures were not imposed for the sake of the German army's safety; they applied only to the country's internal organization, martial law reigning over all that directly affected the army.

Military tribunals, without any intimation to the public of their creation or of their competence, were charged throughout the country with the application of these new laws. These courts afforded no security to those amenable to their jurisdiction, their procedure was neither public nor contested; the dossier not being even shown to the defence, they constituted a purely arbitrary means of government, not a judicial authority.

Along with these military courts von Bissing established by an order of Feb. 5 1915 a judicial system of two degrees. The German governors set over the Belgian provinces were given unlimited power of instituting penalties. Heads of arrondissements and commandants were empowered to institute penalties amounting to three weeks' imprisonment. Besides being thus granted legislative powers, these functionaries were authorized to try persons who disobeyed their regulations, the governors sitting as judges of appeal from the judgments of their subordinates. This edict, conferring as it did judiciary powers on officials, opened the door to administrative tyranny, destroying the insurmountable safeguards which the law had placed between the public and the public administrative authority. Still worse, this edict established for repressive purposes the principle that a penalty imposed on a guilty person could, should the judge so decide, be inflicted on some other person. Such a measure, permitting the penalizing of an innocent person, when the culprit himself was out of reach, annihilated the personal liberty of the inhabitants of the country. These penal powers were carried yet further by an order of Aug. 3 1917, authorizing the governors to sentence delinquents to total or partial confiscation of property.

Besides endangering public liberty and security these edicts illegally weakened the authority of the Belgian tribunals. It
sufficed for the government of occupation to publish an order concerning any offences, jurisdiction on which it wished to keep in its own hands, and obviously by that act Belgian justice was deprived of its rights, to the profit of German justice. The creation of these tribunals occasioned public protests from the bar of Brussels, as a result of which its president, the Bétonnier Theodor, was deported to Germany. Even certain offences against common laws were selected by the German administration to be dealt with by itself instead of by the judicial system of the country; a police des mœurs (police of moral morals) formed in all the large towns being given powers which Belgian law assigned to the public prosecutors and the Belgian courts alone.

But soon the administration of justice was completely taken over by the invaders. On April 7 1918 a permanent German judicial system was established by order in Flanders and Wallonia, their administrative separation having just been effected by von Bissing. The Belgian courts were replaced by German tribunals—Kaiserliche Bezirksgerichte—established in the different arrondissements. The judges, the public prosecutors and their staff, the recorders and clerks, all were exclusively German, appointed by the governor-general in accordance with the usages of German law. The language of these courts was German, their procedure was that of the German code. Usually one judge presided, but in cases where the authorized penalty exceeded five years' imprisonment sentence was pronounced by three judges. Procedure was rapid. The public prosecutor made all inquiries and perquisitions, and warrants of arrest were issued without preliminary judicial inquiry. The court dealt summarily with all affairs in which the authorized penalty did not exceed one year's imprisonment; in other cases procedure was by judgment. The court decided whether or not the accused should have the right of being defended, defence not being officially authorized save in cases tried by three judges. There was no appeal; and in all cases, immediately the sentence had been pronounced, the judge could not be subsequently authorized to put it into execution. In the case of a death-sentence the governor-general had the right of pardon. Judges were removable.

This edict, therefore, replaced Belgian judges by German judges, who, being removable, could not afford security. It abolished the right of appeal, and replaced Belgian procedure by German procedure. The accused found himself being tried in a foreign language, without the right of employing defence, or even of defending himself, the courts having power to set aside any evidence they chose to disregard. The Assize Court was suppressed; the jury, that indispensable safeguard of personal liberty, no longer existed. The same procedure was adopted in the same tribunals dealt with misdemeanours and with crimes, inflicting all penalties, including that of death.

In issuing an order of such scope, the governor-general was acting as a legislator. The Belgian constitution, the judicial organization of the country, were abolished and replaced by German laws and judges. Belgium was being treated as occupied territory, but as a conquered country.

Before describing the transformation of civil justice it will be well to glance at the principles which these German tribunals were established to apply. On Sept. 2 1914, Marshal von der Goltz enunciated in his proclamation of the principle underlying the repressive system of an occupant power: "It is a harsh necessity of war that the punishment of hostile acts falls on the innocent as well as on the guilty." The same principle is found again in the edict of Feb. 5 1915, authorizing the governors to decide that penalties decreed by the German courts of justice should in certain cases be transferred to other persons in default of the culprits themselves. The same principle was applied by a series of edicts empowering the German authorities to take hostages who should pay with their lives for damage done to railway tracks, to inflict heavy fines on communes, to deport the entire population of villages in whose area railway lines had been damaged, to punish whole families for faults committed by single members of them, to treat as guilty all persons found in company with anyone committing an offence. Again, the Belgian was penalized for "not having done" or for "having had the intention to do." Counting on having its task facilitated by the citizens informing against one another, German justice proclaimed that not to give information constituted a misde-
their language was German. The courts of first instance were each presided over by a single judge, the courts of appeal by three judges. The Belgian bar was denied the right to defend persons tried before these tribunals. Such persons, if granted the assistance of counsel, had to apply to the Justizkommissor, who assigned them a counsel for defence. These courts dealt with all causes in which a German or a neutral was concerned; they could besides declare their competences in other cases. They continued the Military functions until a few days before the Armistice.

The administration of justice had now been taken completely into the hands of Germany.

**Attitude towards the Belgian Magistracy.**—From the first days of the occupation the German attitude towards the Belgian magistracy had constantly impeded the normal administration of justice. The German authorities were continually intervening, either to stop prosecutions at common law of Belgians in their own pay, or to prevent the application of repressive measures—rendered necessary by the conduct of the German soldiers—against the demoralization of minors; or to liberate prisoners on remand or after sentence, who were for some reason favoured by the government of occupation. The functions of juges de paix and juges d'instruction were alike subject to constant interference from German officials. Such violations of the independence of bench and magistracy raised vehement protests from the royal procurator, the procurator-generals, and the chief magistrates of the country. Conflicts ensued which often ended in the arrest of magistrates, judges, or royal procurators, and their deportation to camps of civilian prisoners in Germany.

Hostilities between the German Government and the Belgian magistracy became peculiarly bitter in Feb. 1918, when, condescendingly to Belgian law, the arrest was ordered of the Activists Bonn and Zack, promoters of the separatist movement in Flanders. The royal procurator of Brussels was at once ordered to set the prisoners free. Upon his refusal the German authorities employed force to liberate their protégés. At the same time the head of the German civil administration informed the Brussels Court of Appeal that its judicial activities must cease. As a protest the Cour de Cassation at once suspended its sessions and the entire judicial system of Belgium followed suit. Instantly the three presidents of the Brussels Court of Appeal, Levy Mouille, Erna and Carre, were arrested and deported to Germany without trial. This final crisis of the struggle between the government of occupation and the magistracy is but one episode of Germany's attack on Belgium's unity, and even existence.

**Separation of Flanders and Wallonia.**—To disintegrate the Belgian nation was Germany's constant aim from the first days of the war, and the exploitation of the language differences of the country formed her chief means of pursuing it. Imagining that favour shown to the Flemish language would suffice to stimulate the separatist movement, the German Government adopted an attitude distinctly hostile to the use of French. In the zones d'étape of Flanders the military authorities totally discontinued the use of French in their public notices. The Censure only passed Flemish posters and advertisements. Finally the German Government announced its intention to transform the university of Ghent, whose language had hitherto been French, into a Flemish university.

These methods proved devoid of effect, they were succeeded by others more forcible in character. In 1916 various edicts abolished the official use of French in Flanders. From Jan. 1 1917 communications to the Government from that province and all official publications had to be exclusively in Flemish. In the interest of economy and the exigencies of the war it was decided in both sections, one Flemish, the other Walloon, to prepare for the complete separation of public instruction in the two different linguistic regions.

It was on March 21 1917 that the German Government put into execution von Bissing's carefully elaborated scheme for the division of Belgium into two fragments, the edict running as follows:—"Two administrative regions are hereby formed in Belgium, one of which comprises the provinces of Antwerp, Limburg, East Flanders and West Flanders, with the arrondissements of Brussels and Louvain; the other the provinces of Hainault, Liége, Luxemburg, and Namur, with the arrondissement of Nivelles. The first region will be administered from Brussels, the second region from Namur." A series of orders followed, organizing the separation. All ministries were duplicated, those for Wallonia being transferred to Namur. Language separation was complete. On Aug. 9 1917 Flemish was proclaimed the official language of Flanders, the use of French being forbidden to all who hold an administrative or charged with any public service. In Wallonia, on the other hand, Flemish and German remained authorized in communications between administration and public.

Although the Belgian nation as a whole regarded German legislative activities as unworthy of notice, and yielded no submission to this new administrative organization of their country, designed as it was to compass her ruin, yet the invaders were supported in the matter by a handful of Belgians who had passed into their service, and who claimed to represent Flemish public opinion. It was from these persons, who called themselves the "Activist party," that the German formed the "Raad van Vlaanderen," charged with organizing the new Flemish state, to be independent under German tutelage. That this council might have some semblance of legality there were to be elections in Flanders in Feb. and March 1918. As it was recognized that such elections, if honestly conducted, could only result in disaster for the German schemes, it was decided that the members of the Raad van Vlaanderen should be chosen only by such electors—an infinitesimal minority—as should be convoked by name for the purpose. The elections were to be by acclamation, held within closed doors, and under guard of German armed forces. Electoral meetings took place in Antwerp, Mechlin, and Tirlemont; they turned into patriotic demonstrations, and instantly the German Government forbade the continuance of the elections. On Feb. 11 1918 there was a huge demonstration in Brussels against separation. Delegates from over 1,000 associations—political, social, industrial, intellectual, and economic—met in the Grande Place with the object of presenting a solemn protest to the Communal Council. Belgian troops dispersed the demonstrators. In all the towns of Belgium there were protests from the public bodies and great associations. In face of such an explosion of public feeling the German Government dared not confer on the Raad van Vlaanderen the legislative powers it had intended to give that body. A commission composed of the chief German civil authorities in Belgium and of exalted members of the German judicial world met at Brussels to study the subject of the formation of the Flemish and Walloon states. After months of work this commission decided that, as Belgian public opinion was utterly hostile to the separation, there could be no question of creating two independent states; but that, on the contrary, the new states must during a long transition period be placed under the authority of German governors, with the assistance in Flanders of the Raad van Vlaanderen as consultative council.

The Raad van Vlaanderen therefore, figuring as an emanation from the Flemish people, found itself empowered to choose from among its members 11 plebiscitentiaries to form a permanent council which should participate, as a consultative body, in the exercise of that legislative power conferred on the governor-general. This tool in the hands of Germany was perfected by the addition of a Ministry of Defence, charged with raising in Flanders an army of volunteers, which was to fight at the side of the German army against the Belgian army.

At this moment the Brussels Court of Appeal intervened, issuing an order: "All subpoenas issued to the principal members of the Raad van Vlaanderen must be obeyed. The principal members of the Raad van Vlaanderen, who were accordingly immediately imprisoned by the Belgian police. This bold act had as consequence the arrest of the presidents of the Court of Appeal; and the conflict which ensued between the magistracy and the government of occupation resulted in the suspension of all sessions of justice throughout the country, despite the reprisals taken upon the chief magistrates. This solemn protest on the part of Belgian justice stimulated greatly the national movements of resistance.
The nation was further encouraged in its firmness of attitude by the protest of the communal authorities of Ghent, whose refusal to recognize the division of Belgium was answered by the arrest of the aldermen and the deportation of the burgomaster, M. Braun. Ghent was thenceforward administered by a college of aldermen appointed by the German governor-general, who reserved the right of controlling them and substituting himself for them in the exercise of their functions. A German military officer was appointed burgomaster of the town.

The government of occupation hoped to use education as a potent weapon for dividing the country. The Flemish language was proclaimed the only permitted in the State and voluntary schools of Flanders. Even in Brussels, where French is spoken by a large majority of the population, Flemish was to be the only language of instruction. A transition period was conceded, but from Sept. 5, 1918 primary education was to be completely Flemish.

Flemicizing Ghent University.—The centre of the whole scheme for the Flemicization of Flanders was to be the university of Ghent. It was to become a tool in the hands of Germany. Flemicization was decided upon in 1915 by the German Government and overtures were made to the professional body. On that body's refusal to submit to the invaders' desires reprisals began. Prof. Henri Pirenne and Paul Fredericq, accused of leading the resistance, being arrested and deported to Germany. The Ghent professors did not flinch before these intimidatory measures, but stood firm. On March 25, 1916 an order was issued that henceforth all lectures in the university of Ghent were to be given in the Flemish language. Professors who did not deliver their courses of lectures were to be placed on the retired list. The new university retained only four professors from the staff of the Belgian university, one of them a German. To fill its professional chairs it had to draw on students, members of the "Activist" party, Dutchmen and Germans. Shortly after, the German authorities celebrated the opening of the university, and the King of Bavaria graced the ceremony with his presence. A characteristic touch was the omission of Belgian history from the syllabus of the university. To attract students all the scholarships in Belgium were allotted to the university of Ghent, and a shameless campaign of intimidation was organized: students in the zone d'étape were given the alternative of either being transported as forced labour to Germany or pursuing their studies at the "Activist" university. The latter alternative was backed by substantial advantages, extra food rations being added to the scholarship grants of money. Despite all this, and despite the suspension of lectures in all the universities of the country, not 200 students were recruited.

In 1917 the German authorities began to understand that Flemish opinion could not be counted on to aid in the diametrical division of Belgium, and consequently their treatment of the working-class population of Flanders increased in harshness, deportations becoming particularly frequent. But still attempts were made to foster Activist ideas. Lectures and meetings were promoted for the exposition of German views; the publication of pamphlets and tracts was facilitated; ever a form of autonomic propaganda was supported by armed force. In the end it became obvious that no result would ever be achieved by these means, so a new form of propaganda was adopted. At Courtrai an association was formed with the name of Volkspopbeuring (regeneration of the people). Its supposed object was to raise the moral standard of the Flemish people and relieve distress. It was supported by a committee in Holland consisting of the most exalted personages. In reality it had no other aim but to promote the idea of Flemish autonomy. Its activities were ignored, and remained without result until the day in 1918 when the German Government transferred to it the responsibility, till then belonging to the communal authorities, of distributing sugar, syrup, jam, potatoes, butter, etc. Thenceforward, the whole population of Flanders being forced to apply for these necessaries to the Volkopbeuring, propaganda could be made in terms of food, and constraint be exercised directly on each individual through the distribution of the necessaries of life. To make this organization quite omnipotent the Government was further inspired to entrust it with the distribution of the home-grown food supplies. Resistance to anti-Belgian propaganda would then have been reduced by starvation. This project, however, produced such a fury of indignation throughout the country that the foreign legations were moved to protest and succeeded in preventing its realization. The true role of the Volkopbeuring had become so flagrantly apparent that in 1918 it was disavowed by the Dutch committee which had been formed to support it.

The Economic Situation.—The occupation of Belgium by the German army profoundly disturbed the country's economic situation. Industry suffered from the very outset, owing to the measures taken for military reasons. Raw materials were at once requisitioned, and to facilitate that the declaration of stocks was made obligatory, while they might not be disposed of without permission. In Dec. 1914 the declaration was made obligatory of stocks of benzine, petrol, alcohol, glycerine, oils, fats, carbides, india rubber and pneumatic motor tires. On Jan. 25, 1915 this order was extended to stocks of lead, copper, aluminium, antimony, zinc, nickel, mercury, tin and alloys of metals.

Besides requisitions, other measures threatened and destroyed Belgian industry. On Nov. 26, 1914 commissaries had been appointed by the German Government to supervise industrial or business concerns belonging wholly or in part to nationals of countries at war with Germany. On Feb. 17, 1915 this supervision was changed into sequestration. All such undertakings, whether Belgian or foreign, were sequestrated if they could be useful to Germany or if they might be harmful to her. They were temporarily taken out of the hands of their proprietors and their management assumed by the government of occupation, which either continued to work them in the interests of Germany, or proceeded to liquidate them. Over 100 industrial concerns were sequestrated in 1915, about 20 in 1916, about 10 in 1917. They were great metallurgical works, building works, stone quarries, collieries, electrical generating stations, etc. Foreign undertakings, principally British ones, were put into liquidation.

The establishment of central depots for the monopoly of coal, oils, fats, water, gas and electricity, and control of the capital of Belgian industry by the invaders. In Oct. 1914, the Belgian collieries resumed work. On April 24, 1915 the government of occupation established the Kohlenzentrale. Collieries had to send their entire output to the "Central," excepting only what was consumed in their own works. Contracts for deliveries existing at the moment of the publication of the edict were annulled. The Kohlenzentrale was intended to provide coal for the railways and the German army. This object rapidly expanded, and the "Central" became an instrument of official pilage.

The obligation to declare stocks was imposed simply to facilitate requisitions. In Oct. 1914, Germany introduced into Belgium a double system of requisitions: on the one hand, requisitions made directly for the army and the military authorities; on the other hand, general requisitions. The scheme for working them had been framed by Dr. Rathenau, who was entrusted with the creation of the "Department of raw materials of war" at the War Office in Berlin. Such raw materials were first seized, and could no longer be sold at the "Centrals" which fixed their price. If the vendor refused the price offered he was expropriated, and handed a requisition voucher. From 1915 onward requisitions of raw materials and of machine tools were made for the non-military uses. Belgian industries, deprived of raw materials, protested vehemently to the government of occupation that the requisitions should at least be paid for. They were told in reply that if the war tax of 60 millions per month was regularly paid, the price of requisitions would be paid in cash from Jan. 1, 1915. This promise was never fulfilled, a thousand pretexts for delaying the payments being offered: difficulties in transporting and classifying the goods, and in checking the requisition vouchers; disproportion between claimed value and the real value; the necessity of not allowing German specie to leave Germany. Moreover, Germany never regarded herself as responsible for the price of the requisitioned goods;
she said they would be paid for by Belgium after the war. The impossibility, however, for Belgian industry to go on without capital obliged the governor-general to seek some solution. On April 2, 1915 a Caisse de prêts (loan bank) was established at Brussels to make advances on the security of the requisition vouchers. For requisitions made by the army, prices were fixed by the military authorities; for other requisitions valuation was made by the indemnity office in Berlin. The Caisse de prêts might advance 75% of such valuation, if the claimant accepted the price offered. The Caisse de prêts merely gave a voucher, which the Société Générale de Belgique was required to cash; the latter in return being granted by the Reichsbank a credit equal to the sums disbursed, but not to be drawn upon until three months after the signature of peace. The Société Générale vigorously resisted this measure; on the one hand, because the payment of the enormous number of German requisition vouchers must produce an inflation of the fiduciary circulation, with the immediate result of raising the cost of living and increasing poverty; on the other hand, because the Société Générale objected to helping Germany in her requisitions. The Société Générale never consented to cash any vouchers save those issued for requisitions of raw materials. As claimants usually refused to accept the prices fixed by Berlin, the total of the loans granted did not exceed 75 millions of marks.

Requisitions were not confined to industry alone. In all private houses objects of copper, bronze, metal alloys and wool mattresses were seized. The following table shows the requisitions made by the area of General Government during the second half of 1917—:

Up to June 1918 there had been requisitioned:
290,000 tons of iron
7,000 " copper from factories
3,500 " private houses
9,300 " copper produced in Belgium
7,000 " lead
24,000 " in different forms, produced in Belgium
35,000 " zinc
and also 8,550,330 marks worth of leather and leather straps.

Producers were obliged to deliver their total output to the "Central" at very low prices. The "Central," after having supplied the army and the railways, resold the surplus at very high prices to the factories which were authorized to work. Two offices for the distribution of coal to the Belgian population were established at Brussels and Namur, but the quantity allotted for this purpose was quite insufficient. Indeed, the Kohlenzentrale tried to export as much coal as possible to neutral countries, for the sake of the large profits realized in that way.

In 1913 the export of Belgian coal to Germany reached 115% of the pre-war figure, in 1916 95%, in 1917 25%. Germany, on her side, imported approximately equivalent amounts of coal into Belgium.

The export to neutral countries was much greater, being in 1915 190% of the pre-war figure, in 1916 230%, in 1917 falling to 90%. The exportation of Belgian coal seemed to Germany a lucrative operation. At the meeting of the Economic Commission on June 19, 1915 in Karlovi, representing German trade, declared: "The coal production of Belgium must first supply domestic requirements and afterwards Belgian consumption. The surplus must serve German purposes, notably as an export to neutral countries." This was the accepted doctrine.

In 1917 the distribution of Belgian coal was as follows—:

<table>
<thead>
<tr>
<th>1st quarter.</th>
<th>2nd quarter.</th>
<th>3rd quarter.</th>
<th>4th quarter.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Belgium population and authorized industries</td>

<td>9.6%</td>
<td>8.75%</td>
<td>5.75%</td>
</tr>
</tbody>
</table>

Military needs absorbed 4,665,975 tons, one-half of the total output. Thanks to the Kohlenzentrale's monopoly, the profits realized by it were large. The figures are as follows—:

<table>
<thead>

</table>

The total profits for the three years amounted to about 34 millions of marks, which were used as a German war loan.

An oil "Central" on the same model was established on June 3, 1915. It realized a profit of 11,815,466 francs in the years 1915, 1916, 1917; 6.5 millions of which were for 1917 alone. Finally, on July 26, 1915 the "Central" for water, gas and electricity was instituted, important services thus being placed under the direct control of the German administration.

The German Government now controlled all the elements indispensable to industry. Henceforth no undertaking could escape its power. Industry was forced into absolute submission to the terms imposed by the invaders.

Belgian marine export trade had, of course, been stopped by the war. Belgian factories closed down one after the other and the numbers of unemployed quickly became enormous. The Comité National, whose activities will be described later, organized relief measures, got work of public utility started, and established bourses de travail (labour scholarships), which, while supporting the unemployed person, exacted meantime his attendance at technical classes. The German authorities intervened in 1915 and opposed this great organization for assisting the unemployed.

It was soon realized that the only efficacious method of helping the Belgian masses was to revive trade, and in Aug. 1915 a
Belgium

Comité Industriel was formed for that object. It entered into negotiations with the Allied Governments in order to obtain permission to import raw materials into Belgium—such raw materials, once manufactured, to be re-exported and the process repeated applied to the purchase of foodstuffs necessary for the sustenance of the Belgian population. The Allies were willing to agree to such an arrangement, but the German Government made the condition that payments for the exported goods should be deposited in a Belgian bank. England declared that she could not accept such a condition, which would have meant that the Allied Powers would be helping Germany, so the Comité Industriel dissolved without having achieved anything.

The numbers of the unemployed became daily more alarming. In 1916 they reached 650,000. On Oct. 16 1916 the Comité Nécessités, in an attempt to seize from Belgian factories any machinery which could be utilized in Germany. The real object was to destroy Belgium's trade, as being a dangerous rival to that of Germany. Pure vandalism characterized these requisitions, the experts even destroying machinery which they found it impossible to remove.

Again official orders of Jan. 10 and Oct. 10 1916 forbade more than 24 hours work per week in the textile and boot-making trades; and those of Feb. 17 and July 21 1917 forbade work in all workshops and factories of Belgium save by authorization of the president of the civil administration.

The working-class population of Belgium was reduced to beggary. The masses of unemployed became more and more numerous. Germany desired them more numerous still. Public works started by provinces and communes to provide employment were suddenly prohibited. Germany exposed her hand.

The president of the civil administration expounded the German theory in a speech delivered before the députation permanente of Luxembourg. Relief of the unemployed, he said, would be possible in the case of persons deprived of work by the German regulations. Workers aged from 18 to 50 could go to Alsace-Lorraine or Germany, and work there for good wages. If able-bodied members of the working-class would consent to go to Germany, communes would be once more authorized to provide public work for the unemployed of under 18 or over 50.

Thus, by means of a skillfully planned series of edicts, Germany had attained her object—had completely ruined Belgian industry and had created an unemployed class of nearly 700,000 workers, whom she forbade the public bodies to provide with work.

Nothing remained but to transport this potential labour into Germany.

From 1917 onwards Belgian industry was subjected to systematic destruction. By June 30 1918, 167 factories had been completely destroyed, 161 factories were mentioned by the administrative report to the governor-general of the section for commerce and industry as to be destroyed immediately, 93 large halls were being demolished, others had been cleared out, 52 halls were to suffer the same fate. Of the 57 high furnaces existing in Belgium, 26 had been razed to the ground, 20 were seriously damaged, 11 only remained fit for use.

The Service de Récupération Industrielle subsequently identified in Germany 24,308 Belgian machines and 89,655,640 kgrm. of various kinds of plant. Machinery that could not be carried away entire, had been broken up by hammer blows and the pieces sent to Germany; 290,000 tons of iron, 7,000 tons of lead (coming chiefly from the storing chambers for sulphuric acid) had been taken from the factories.

Metallurgical works, textile factories, chemical works, quarries (save those requisitioned by Germany), cemeteries, gunfoundries, works of public bodies—all were completely despoiled. The collieries alone, being indispensable to Germany, were spared. But when the German army was in final retreat measures were taken to destroy the mines completely. On Oct. 26 1918 orders were given for work to cease in the coal-fields of Hainault. On Nov. 1 pits and machinery were mined, pumping and ventilation were stopped, boiler furnaces extinguished. This would have meant the putting of Belgian mines out of action for years. In face of such an act of vandalism the neutral Powers protested, threatening Germany with economic reprisals, whereupon pumping was recommenced, and the pits and machinery were spared.

In all this policy of destruction Germany had a double aim: On the one hand, she was ruining Belgian trade and eliminating future rivalry from that quarter; on the other hand, unemployment was being daily increased, hundreds of thousands were being thrown out of work, and she was provided with a pretext for requisitioning human labour as she had already requisitioned raw materials and machinery. A series of edicts now prepared for that purpose.

Deportations.—In Oct. 1916 the military authorities made the first requisition of men for work in Germany. At that time nearly a million persons were in receipt of public relief in Belgium. In Nov. burgomasters were ordered under heavy penalties to furnish the German authorities with lists of the unemployed receiving relief in their communes. In every case the enemy Government was met by refusal on the part of the communal authorities. The military authorities thereupon began a general requisition of able-bodied men throughout the country, whether unemployed or not. Notices posted in the communal offices ordered all men aged from 17 to 60 to present themselves at the headquarters of the local military authorities. Many of those so-called conscripts, who were mustered in, were paraded within double lines of infantry and cavalry. Non-commissioned officers next proceeded to designate those who were to be deported to Germany or to the zones of the front. These unlucky ones were immediately marched to the nearest station, put on a train, and sent under guard to Germany.

Generally speaking, the inhabitants of Flanders—the zone de l'Etape—were sent to the Yser front or to that in the north of France. They were set to work constructing railways, repairing roads, or digging trenches in the zone of fire. Many of them were killed by the Allied bombardment. Workers requisitioned from all parts of the country were concentrated in great camps at Münster, Altengrabow, Guben, Cassel, Meschede, Soltau and Wittenberg. They were ordered to sign labour contracts, and their obstinate resistance was met by the most inhuman methods of intimidation and coercion. Deprived of food, beaten—even with blows of the bayonet—left tied to posts in the snow for entire nights, numbers of them yet perished rather than work for the enemy. In the camps the "purveyors of men" came to take delivery of the human merchandise allotted to them, and distributed it to farms, factories and mines throughout Germany. Frequently on the way they were taken to Stettin, Lübeck, at the front, where they were treated like convicts. Such camps, that at Sedan for instance, were responsible for many victims. From time to time convoys of sick were sent back to Belgium; the lamentable state in which they arrived provoked a great protest movement throughout the country.

The first voice to make itself heard was that of Cardinal Mercier, Archbishop of Malines. He addressed a protest to the governor-general against the inhumanity of the deportations. In particular he said: "I will not believe that the imperial authorities have said their last word. They will reflect over their unmerited sufferings, the repudiation of the civilized world, the judgment of history, the chastisement of God." On Nov. 9 1916 the members of the Belgian Parliament in their turn addressed a courageous protest to von Bissing and appealed to the neutral nations. On Dec. 16 the magistracy in its turn protested. In
Nov. Senator Magnette, Grand Master of Belgian Freemasonry, addressed a letter to Grand Freemasonry, in which he wrote:

"The brutal and total suppression of personal liberty, a repetition of the most painful wanderings of Jewish history, the captivity of an entire innocent nation, which for over two years has given an example of marvellous calm, dignity, and patriotism—does not all this cry for vengeance, are you going to disregard it?" German Freemasonry made no reply, but M. Magnette was answered by valiant. The censorship prevented publication of these numerous protests, which would have encouraged national resistance. Cardinal Mercier determined to address the nation from the pulpit of St. Gudule, the cathedral of Brussels. There, on Nov. 25, he addressed the faithful, lashing with burning words the inhumanity of Germany, and exhorting Belgians to stand fast in resistance, in patriotism and in faith in their ultimate victory. The vast throng of his hearers received these words with indescribable enthusiasm.

Finally, on Feb. 14 1917, the most important members of the clergy, the Comité National, Parliament, the magistracy, the bar, the nobility, financial circles, etc., addressed the German Emperor in a letter at once dignified and firm, demanding the repatriation of the deported Belgians. The foreign legislations still at Brussels—those of the United States, Spain, and Holland—also showed sympathy. Cardinal Mercier had appealed to the Pope, and on Nov. 29 1916 the Pope had approached the German Government on behalf of the victims of deportation, but without effect. The United States now protested to Berlin against such violations of the principles of the Hague Convention, and the Dutch legislation did the same. At the time of the fall of Antwerp in 1914 the inhabitants of that town, terrified by the massacres of Visé, Dinant, Andenne, Turnhout, Louvain, and Visé, had fled en masse into Holland. The German Government had requested the Dutch Government to assure the Belgian refugees that if they returned to their country they would not be subjected by Germany to requisitions or any other molestation. On the representations of Holland the people of Antwerp returned to Belgium. Germany had now taken thousands of men from among them for deportation, and Holland could not but protest against such disloyalty to promises made to her. These interventions also remained without result, but at last the insistance of Spain, the country which was protecting Belgian interests in Germany, succeeded after a preliminary repulse in obtaining a compromise from the German Government. The Marquis of Villalobos, Spanish Minister at Brussels, proposed an arrangement by which Germany should engage not to deport more than 250,000 men who should be chosen from the unemployed; to allow those of the already deported who possessed means of existence to return to their homes; to permit deported Belgians to correspond with their families and send them money; and finally, to place Belgian workers in Germany under neutral surveillance. Germany agreed to all these conditions except the last

The neutral legations next intervened to effect the transmission to the governor-general of claims from families whose deported members should, by the terms of the above convention, be authorized to return to Belgium. These claims were numerous; in one month the Dutch legation received 33,000 for transmission.

The deportation policy had proved a disappointment to Germany. The exiles refused to work, and, when forced into a semblance of submission, met coercion with an inertia which rendered them useless. The indignation at this return to slavery seemed to decide Germany on a movement of clemency. In reply to the letter of Feb. 14 from distinguished Belgians the Emperor announced that he would examine the matter with benevolence. It was speedily decided that the victims of deportation should be repatriated on June 1 1917, and Germany published this decision far and wide. It proved but a piece of abominable treachery. Numerous convoys of the deported did indeed return to Belgium, but soon after they were again summoned to the Kommandantur, and, under pain of being deported anew, were forced to accept work in the requisitioned Belgian factories. Moreover, the authorities declared that the Emperor had not promised that Belgian workmen should not be deported into France, and many of the convoys which arrived from Germany were immediately sent off to the invaded French departments. A yet more hypocritical construction was put on William II.'s words. He had promised the repatriation of the deported Belgians, but once repatriated there was nothing against their being deported a second time as unemployed. So the deportation began again, only to be ended by the Armistice.

Total of deaths resulting from bad treatment: 2,531.

**Feeding the Belgian Population.**—Belgium could not feed her population unaided. She did not produce above a quarter of her wheat consumption. Thus as early as Aug. 14 1914 the Belgian Government had rationed bread. By Nov. scarcity was being felt in Hainault; and in the following month the provinces of Limburg and Luxembourg and all the towns were short of flour, while the rural districts lacked coffee, salt, yeast, coal, petrol and soap. Prices began to rise sharply. The situation was the more critical because, the country once occupied, the German governor had abrogated all measures already taken by the Belgian Government to ensure its food supplies. The public administrative bodies could no longer act; private initiative had to take their place. Everywhere committees were formed. At Antwerp a Comité de secours collected 2,000,000 francs for organizing relief to the necessitous; while a Comité de ravitaillement, formed by the communal authorities and including in its sphere of action the 82 communes of the fortified area, secured 18,000 tons of wheat, bacon and lard, 2,000 horses, cattle, and 24,000 pigs. At Liége a Comité d'alimentation was formed to manage the provisioning of 23 communes. At Brussels the Comité de secours du Luxembourg endeavoured to succour those left homeless by the burnings and devastations of the German Army. At Bruges and Ostend committees were formed to purchase wheat. Everywhere such organizations appeared, but they were impotent to save the country from the famine which menaced it, for the German Government, in order to exercise pressure on the Allies, declared
that, as the British blockade prevented it from maintaining the provisioning of Belgium, it had no further concern in the matter.

A central committee was formed in Brussels, consisting of personages of the financial world, presided over by E. Solvay, and under patronage of the ministers for Spain and the United States. It took the title of Comité centrale de secours et d’alimentation. An executive committee was appointed with M. Francq as chairman, the first meeting taking place on Sept. 3, 1914. It at once opened canteens and food depots, obtaining through the good offices of neutral ministers a guarantee that they would not be seized.

But by Sept. 1914 famine was already imminent. The Comité centrale tried to get food from England; the British Government objected. Active negotiations procured an agreement: Marshal von der Goltz promised to exempt totally from requisition food so imported; the British Government on their side consented to the importations on conditions that the supplies should be conveyed to the Belgian frontier under patronage of the ambassadors of Spain and the Unites States, and that once in Belgium they should be under the patronage of the Spanish and American ministers at Brussels. The Commission for the Relief of Belgium was constituted to organize this scheme. The importation of food supplies now made the Comité centrale a body of great importance, and its activities extended all over the country. In each province a Comité d’alimentation was set up, its president sitting on the Comité centrale in Brussels. The Comité centrale now took the name of Comité national de secours et d’alimentation.

Permission to import food was not enough, a method must be found of paying for it. Von der Goltz would not allow dry goods to be transferred to the Allies; funds must be procured outside Belgium. The Belgian Government and the British Government each opened a credit of £1,000,000 to the C.N. The Société Générale put its own foreign credits at the C.N.’s disposal. A consortium of bankers and of the firm of Solvay et Cie. provided a loan of 15 million francs in gold, advanced by the London branch of the Banque Nationale de Belgique. In addition donations to the amount of 60,000,000 francs were collected in Belgium itself, and zealous propaganda was made abroad with the result that 65,000,000 francs were collected in England, 35,000,000 in Argentina.

Huge quantities of foodstuffs had to be imported; 69,000 tons were needed every month, which implied at the same time 180,000 tons purchased, stored, or in transit, representing a value of 70 to 80 million francs. The funds at the C.N.’s disposal were insufficient. True, the proceeds from the sales of the imported goods would have balanced expenses, but the German Government would not allow money thus received by the C.N. to leave the country. An arrangement was therefore made between the C.N. and the Belgian Government, whereby the C.N. undertook to pay the salaries of the Belgian officials, while the Belgian Government in return paid over monthly an equivalent sum to the Commission for Relief in Belgium. This sum was fixed at 25,000,000 francs per month, but that proved insufficient, and in Jan. 1917 it was augmented to 37,500,000 per month. Just then, however, the submarine war stopped importations for several months, and the price of foodstuffs rose enormously in consequence. Moreover, the transference to Belgium of 150,000 French refugees who had to be supported by the C.N. further exhausted the latter’s resources. New measures became necessary. The Belgian Government concluded an arrangement with the American Government, by which the latter gave 13,000,000 dollars per month to the C.R.B. to pay for purchases of food made in the United States. For purchases made in Holland the C.N. obtained use of the credits possessed in that country by all Belgian banks.

The functions of the C.N. did not consist in merely securing the arrival of supplies of food in Belgium, but also in distributing them throughout the country, and in those districts of northern France whose provisioning it undertook in 1915. The essentially private character of the C.N. and the refusal of the German authorities to allow it to organize a police de surveillance to safeguard its activities, made the situation very difficult. It is true that the Cour de Cassation, by authorizing the courts to punish persons who contravened the C.N.’s regulations, gave it valuable help; but its task was only rendered possible by its admirable organization. At first decentral in system, the C.N. was forced by events to centralize. It was worked by its executive committee, whose president, M. Francq, possessed the widest powers. He in fact directed the vast organization, assisted by a general secretary. The C.N. was divided into two departments: the département d’alimentation, responsible for provisioning the country, and the département des secours, responsible for relief measures. These two departments worked in close collaboration with the Commission for Relief in Belgium, formed in London in Oct. 1914, under direction of Mr. Hoover, and under patronage of the Spanish and American ambassadors at London, Paris, Berlin, Brussels, and The Hague. The C.R.B. had offices in New York, London, Rotterdam and Brussels. The three first effected the purchases for which they received orders from the C.N., the fourth supervised the distribution in Belgium.

The département d’alimentation had a subsidiary department for the study of alimentary questions, and another for inquiry into the needs of the country. Guided by these it gave its orders to the C.R.B., received the goods, and distributed them among the provincial committees. The vast scope of its functions necessitated the creation of a goods book-keeping department and a financial book-keeping department, also the putting under public control of the manufacturing processes applied to some of the materials received.

To show the magnitude of its task it may suffice to mention that up to Dec. 31, 1916 it had delivered food to the provincial committees to the value of over 35 milliards of francs, 2-5 milliards having been for Belgium and one milliard for France. A bonus was deducted from the sales of goods and paid over to the département des secours. The German authorities showing signs of intending to assume a share in the control of these sales, the C.N. asked the C.R.B. to deduct the bonus, so that it should escape German surveillance. Thanks to these bonuses, to which were added the voluntary donations from foreign countries, the département des secours accomplished a vast amount of relief work. A commission for the purchase of clothing and materials, with workshops for cutting and making, and for the training of apprentices, as also with technical courses for students, supplied the provincial committees. Grants of money were also given; up to Dec. 31, 1918, 1-3 milliards of francs had been distributed to the necessitous poor. This department gave grants besides to the societies for aiding officers’ and non-commissioned officers’ wives, families deprived of means by the war, the unemployed, and the lacemakers, to the societies for providing food for infants, succouring war orphans, the homeless, foreign refugees, artists, wounded soldiers, etc. Under its patronage were the Société coopérative d’avance et de prêts (formed to help State officials and employees), the Société des habitations ouvrières, the Ligue contre la tuberculose, the Unioin des villages et des communes belges pour venir en aide aux sans-abris sinistrés, the Agence de renseignements pour prisonniers et internés, the Cantile du soldat prisonnier, the Caissette du soldat belge. From Nov. 1917 its scope was widened further by the society for the relief of unemployment.

Delegates from the C.R.B. took an active part in the work of the C.N. They attended the meetings of the provincial committees, and thus provided the necessary liaison between them and the central executive, which could not have been done by members of the C.N. as the Germans did not permit them to travel about freely. The collaboration of the C.R.B. was also valuable in regard to the transport within Belgium of provisions for the provinces. The C.N. placed the flotilla it had formed, of 137 vessels (45,000 tons) and of 29 tugs, beneath the flag of the C.R.B., thus avoiding requisitions.

The C.R.B. undertook the frequently necessary negotiations with the German and British Governments. The gravest difficulty ever encountered was when in 1915 the German authorities prohibited the C.N. from dealing with the distribution of the indigenous foodstuffs. These were to be distributed by the
provinces and communes and thus neutral control was eliminated while Germany was enabled to requisition Belgian produce in her own interests. Besides the crops 92,000 horses (out of 317,000), 560,000 head of horned stock (out of 1,879,000), 250,000 pigs (out of 1,494,000), 3,000 sheep, and 1,660,000 fowls were sent to Germany. To stop this England threatened curtailment of the food supplies for Belgium. This serious crisis was averted by the good offices of the C.R.B.

Upon America’s entry into the war Mr. Hoover resigned his function on the C.R.B., after three years of devoted work. Holland replaced America, and the Comité Hispano-Neerlandais took up the task of the C.R.B.

The Belgian Government during the war.—The gradual occupation of the country by the German army compelled the Belgian Government to retire first to Antwerp, then after the fall of that town to Ostend, finally to Havre. Ministers accredited to the Belgian Government followed it there, except the Spanish Minister, the Marquis of Villalobos; the American Minister, Mr. Brand Whitlock; and the Dutch chargé d'affaires, M. van Vollenhoven, subsequently appointed Minister—these three remained in Brussels.

At the time of the Government’s removal to France over a million Belgians were fleeing before the German armies to foreign countries: 200,000 took refuge in France, 100,000 in England, 700,000—including nearly the entire population of Antwerp—in Holland. Germany’s assurances that Belgians who returned to their country should not be molested brought back the inhabitants of Antwerp, to suffer subsequently from deportations despite the protest of the government of von der Goltz. Fifty-thousand refugees remained in Holland.

The Government at Havre found itself faced by a gigantic task. The army, deprived of bases and depots, was without munitions, food supplies, or clothing. All had to be reorganized. Yet not for one moment were the Belgian field forces withdrawn from the front. To reinstate them the King appealed to Belgians residing abroad, and they formed a first contingent. Thousands of Belgians who had remained at home also responded to the call of their King, and managed to get out of Belgium despite the stores with which the frontier was guarded. The high-pressure electric wires separating Belgium from Holland, and the severe penalties decreed against those who joined the Belgian army. On March 1, 1915, having succeeded in establishing the necessary centres of instruction, the Government called up all Belgians between the ages of 18 and 25 resident in non-occupied Belgium, in France, or in England. On July 21, 1916 all Belgians aged 18 to 40 resident in allied or neutral states were called to the service of their mother-country.

Colleges for officers were established in France—at Gaillon and Bayeux for infantry; at Onival for artillery; at Cambrai for cavalry; at And is-le-Pre for Musketry. At the centres of infantry instruction were established at Parigéné-Lévêque, Audouiny, Honfleur, Granville, Saint Lo, Contances, Carteret, Barneville, Valognes, La Haye-du-Puits. The artillery instruction centre was at Eu, that for auxiliary troops at Buchard.

On March 16, 1915 a royal decree ordered the creation of building and repairing workshops, munitions factories, foundries, forgeries, storehouses, etc. Huge establishments improvised at Havre provided the army with all its artillery munitions.

Hospitals capable of accommodating all the Belgian wounded were provided at the front. A school of rehabilitation for the mutilated was established at Vernon. Belgian schools were started in France, England, and Holland. Necessitous refugees were helped.

Thanks to unremitting efforts the army was kept up at an effective average of 150,000 strong, and the field army at 75,000.

III. After the War.—When the offensive of 1918 brought liberation to Belgium the work of restoration to be accomplished was enormous. The Treaty of Versailles did not facilitate it. Shut out from the deliberations of the Supreme Council, Belgium could neither claim her rights nor defend her interests as, if represented, she would have been able to do.

For Belgium the most important question raised by the war was the revision of the treaties of 1830. Those treaties had fixed the international status of the country by declaring it neutral in perpetuity under guarantee of the Powers. They had moreover mutilated Belgium by taking from her the half of Limburg with Maestricht, and giving it to Holland, and the half of Luxembourg, which was created a grand duchy. This mutilation gave Belgium frontiers impossible to defend—Maestricht forming a bridge-head on the Meuse, which was the country’s natural line of defence. There was, further, pressing for settlement, the question of the Scheldt, that essential organ of Belgium’s economic life; its estuary was in the possession of Holland, who could thus control the economic and military fate of Antwerp.

Nothing was done. Rather than take from Germany the ancient Dutch provinces of Guelders and Cleves, which would have served as territory to exchange for the cession of Limburg to Belgium, the Treaty of Versailles prevented a political and military solution of the Limburg question; while Holland on her side refused to solve it by a treaty of common defence between Belgium and the Netherlands. The grand duchy of Luxembourg was the object of French designs, which prevented its restitution to the mother-country. The question of the Scheldt was left hanging. Belgium only obtained two of the 14 Walloon cantons incorporated in Prussia in 1815—Malmedy and Eupen. She was also given the right to connect Antwerp with the Rhine by a canal.

As regarded finance, Belgium was relieved of her war debts (six milliards) to the Allies, who declared Germany responsible for them. Priority was granted to Belgium for a payment of 2·5 milliards from the German indemnity, this representing the reimbursement of 2·5 milliards extorted from her by Germany under the designation of war tax.

Belgium was left to seek aaided a solution to the grave problems which beset her. She entered on negotiations with Holland. These were going badly for Belgium; it seemed likely that the Scheldt would remain in Holland’s possession, and that the defence of the eastern frontier would continue to be an insurable problem, when Holland put forward a claim for recognition of her sovereignty over the port of Weilngen—that is to say, over the Belgian territorial waters from the Dutch frontier to beyond Zeebrugge. This manoeuvre—made possible by the isolation in which the Allies had left Belgium, and by the favour shown by England to Holland’s doctrine that the Scheldt should be closed to Belgian warships—had for object, and would have entailed as consequence, Holland’s right to deny Belgium access to the port of Zeebrugge, which would have meant that she was completely cut off from the sea. The general movement of protest throughout Belgium against the signature of such a Dutch-Belgian treaty compelled the Government to break off negotiations.

In 1918 Belgium joined with France in a treaty of defensive alliance, attempts being made to secure England’s participation. As a result of negotiation France renounced in favour of Belgium her economic union with the grand duchy of Luxemburg.

As regards Africa, Belgium did not succeed in gaining recognition of her rights over the territories conquered by her in German East Africa. Only Urundi and Ruanda were allotted to her; the other territories passed to England.

In the occupation of the Rhine Belgium was represented by a force of 12,000 men.

The Work of Restoration.—Internal problems were very grave. Before all it was necessary to ensure the food supplies of the country. This task was enhanced in difficulty by the fact that private enterprise could not touch it, owing to the sharp fluctuations of the exchange. The State itself was thus forced to purchase abroad the cattle, butter and margarine needed by the population. Maximum prices having proved inefficacious, a number of administrative orders were issued, forbidding speculation in foodstuffs, authorizing the requisition of indigenous products, establishing inspection to prevent vendors from adulterating goods, and repressing excessive prices.

The social situation was terrible. There were 800,000 unemployed; and 2,400,000 persons in a third of the population—only
existed by the aid of public relief. The State had to assume the support of these unemployed masses. Labour exchanges were established to facilitate the distribution of recruits to reviving industry. The vast numbers of the workless might have led to famine wages; to obviate this the State decided that any workmen offered less than the minimum rate of one franc per hour in the towns and 0.75 in the country, might refuse work, while yet continuing to draw out-of-work relief. Workers, moreover, were organizing themselves so as to improve labour conditions. The trade-union movement advanced with enormous strides. In 1919 the number of organized workers had risen to over 600,000, having been only about 200,000 in 1914. Wages, as a matter of fact, never fell below one franc per hour. Industrial workers in general have obtained two francs per hour, metallurgical workers earn 2-25 to 2-50 francs per hour, miners 16 to 20 francs per day.

The astonishingly rapid reconstruction of 2,000 km. of destroyed railway lines, effected by the end of 1919, the renewed activity of the collieries, which in the first quarter of 1919 produced 8-5 million tons of coal (against 11-5 million in 1914), and of the coke furnaces, which in May 1919 produced 58,000 tons (against 245,000 tons in May 1914), helped on the gradual revival of industry.

The Commission de récupération industrielle gave a first stimulus to industry by recovering Belgian machinery from Germany, and by 1919 huge orders from English and American firms had restored the country to economic activity. These orders were made possible by credits opened to Belgian industry by the banks. After the war the banks had indeed become of capital importance. The capital of Belgian industries increased their capital by 380,000,000 francs.

In Dec. 1919 the output of the mines reached 81.5% of the pre-war output. The coal-fields of Limburg were becoming active; in 1919 the Winterslag mine began work, producing 500 to 600 tons per day, in 1920 a second mine was opened. The metallurgical industry achieved 26% of its 1913 output of cast iron, and 40% of steel and finished iron.

Alimentary industries, the building trade, industries of art and precision, were now employing 75% of their pre-war staffs, glass-making 60%, mines and transport over 100%, chemical industries, ceramics, paper-making, linen-weaving, tobacco manufacture 70%, clothing 87%, metallurgy 64%, the timber trade and furniture-making 66%.

Such a revival, effectuating itself in the midst of the gravest economic difficulties, could not but raise one problem after another. Questions of wages and of hours of labour were continually endangering relations between employer and employed. Thanks to a policy of foresight and moderation the Government managed to avert most of the conflicts. In April 1919 two commissions were appointed to inquire into the possibility of reducing hours of labour in steel manufactories and in mines. The principle of the 8-hour day was admitted. On June 1 1919 work was reduced to 8 1/2 hours per day, on Dec. 1 to 8 hours per day.

In June another commission took up the same question for mechanical construction. Later, national councils were appointed for the public services of gas and electricity, for ice factories, the building trade, the timber trade, and furniture-making, glass-making, the textile trade of Flanders, and the port of Antwerp. The committees, presided over by officials, and composed of employers and employed in equal numbers, discussed questions of wages and conditions of work. They often passed resolutions constituting actual collective contracts, in some cases they proceeded to codify their decisions. They settled many local disputes, and checked movements dangerous to national life. The law does not enter into either their constitution or their functions; they have no means of enforcing their decisions other than the appeal to public opinion; yet there had not been one instance up to 1921 where resolutions passed by the committees had not been loyally applied. Employers and employed found in these bodies a means of discussing and solving problems which formerly would have been met by a strike. The establishment of these committees marks an interesting tendency towards the decentralization of economic legislation, towards a professional organization quite outside political parties, towards the assumption by the worker of his share in the solution of industrial problems.

Since the war, as a general rule, wages had risen considerably, with a tendency towards uniformity and towards their fixation according to index numbers published by the Government. In Dec. 1919 the index number was 339 relatively to the month of April 1914.

Belgium’s resumption of production after the war is shown in the following table in which the imports for 1919 and the exports for 1919 and 1920, from and to the chief regions in question, are shown.

These figures show the war’s disastrous effect on Belgian commerce. In 1914 exports and imports were fairly equivalent. In 1915 imports exceeded exports by about three millions of francs. In 1920, it is true, the export trade to the seven countries named above began to revive, improving from 4,749,707 tons to 6,926,800 tons. But trade was still lagging behind pre-war conditions.

Belgium made great efforts to develop her commercial marine. The Lloyd Royal Belge, entirely promoted by Belgian capital, was formed to add to the Red Star Line’s already existing service between Antwerp and America regular services to Brazil, the British West Indies, the Far East, Australia, Spain, Italy and the Near East.

But though Belgian commerce and industry were showing their powers of rapid recuperation, the country’s financial situation could not but be serious. Scarcely had it left back in Belgium when the Government had to face the cost of redeeming the marks put in circulation by Germany; the amount represented 7-5 millions of francs. Other heavy charges upon State finances were: the payment of arrears of salary due to officials; the augmentation of salaries necessitated by the enormously increased cost of living; the expenses of victualing the army and of reconstructing railways, canals and roads; the sums voted for compensation to industrial concerns and private persons for war damage and destruction.

In 1919 the national debt amounted to 12,964,050,000 francs; in 1920 it was over 30 millions. To meet a situation of such gravity new taxes had to be imposed. The income tax established by vote on Oct. 21 1919 took 10% on unearned incomes, and a graded percentage on earned incomes which only reached 10% when such an income was over 48,000 francs.

On Oct. 11 1919 a new law of inheritance imposed a tax varying with the heir’s degree of kinship to the deceased from 1 to 50% upon the sum inherited; while inheritance from an intestate was suppressed in favour of the State beyond the fourth degree of kinship. New taxes fell on beer, tobacco, alcohol, and cinemas.

On March 3 1919 war profits were taxed progressively up to 10% and railway fares were doubled.
Despite these efforts it was obvious that the Belgian budget could not be restored to financial equilibrium save by Germany's payment of the war indemnity. In order to have some guarantee of that indemnity the Government, on Nov. 10, 1918, placed under sequestration all property belonging to subjects of the enemy countries. The chief item of expense was the indemnification of war damage, estimated at over 35 billions. The State supported the formation of cooperative societies, advancing to persons who had suffered war damage up to 70 to 95% of the compensation due to them, and the creation of the Crédit National Industriel, also supported by the Banque Nationale, and serving as an intermediary between the State and the claimants. To provide the advances these organizations issued 5% bonds guaranteed by the State up to the value of the compensation for damages. Thus the debt was brought into the hands of several groups, which should greatly facilitate its liquidation.

The work of national reconstruction was being accomplished up to 1921 amid political and social calm. After the Armistice the Government was composed of ministers belonging to the three great parties. All political strife had ceased, a truce having been brought about by mutual concessions. Universal suffrage "pure and simple" was established by a law passed at the demand of the Socialist party. As compensation the Catholic party claimed votes for women, which the Chamber conceded for communal elections but not for parliamentary elections. The elections of Nov. 16, 1919, with universal suffrage at 21, deprived the Catholic party of the majority it had enjoyed since 1884, while the Socialists gained considerably.

Thanks to this political calm, Parliament was able to introduce such important reforms as the income tax, and the prohibition of the sale of alcohol in public (law of Aug. 23, 1918). The only disturbing elements in Belgian public life in 1920 was the Activist movement. Persecuted by German intrigue during the war, it still existed, making the independence of Flanders its ostensible object. At the last election its candidates only polled 62,000 votes out of 1,757,104 cast, and it was generally condemned by public opinion. The members of the Raad van Vlaanderen and certain Activists who had assisted the enemy were convicted of high treason and sentenced, but they had escaped to Holland, where they were well received by both the Government and the public.

Belgium took an honorable part in the proceedings of the League of Nations. In Brazil, Greece and Spain she was invited to join the Council along with the Great Powers, and her delegate, M. Hymans, was elected president of the first general assembly at Geneva. At that assembly Belgium was reflected as member of the Council, to sit on it with Brazil, Spain, China, and the Great Powers. With the object of extending Belgian influence abroad, the diplomatic and consular services were completely reorganized. The Association Internationale des Académies has chosen Brussels for its centre of activity.

On Aug. 19, 1920 the Académie de la langue française was inaugurated at Brussels. Dr. Bordet, professor of Brussels University, was awarded the Nobel prize. University life had revived. The civil status granted to the universities of Louvain and Brussels was on July 5, 1920 extended to the universities of Ghent and Liège. The profits realized by the C.R.B. were presented by the president, Mr. Hoover, to the Belgian universities. Each of them was the recipient of a donation of 20 million francs, intended to develop the scientific side of their work. Mr. Hoover moreover presented a sum of 80 millions to the Fondation Universitaire, the income to be allocated by a committee of university professors to encourage the advance of science in Belgium.

Finally, mention must be made of the reform of justice, the creation of single judge tribunals, reforms in the treatment of prisoners, and the institution of a school of criminality. The Government established a school of agriculture at Ghent, a school of social service, and a colonial school. A commission of inquiry was appointed to investigate the violations of international law committed by the Germans in Belgium. Archives of the war were founded to collect all the documents relative to the history of Belgium from 1914 to 1918.

BIBLIOGRAPHY.—From the historical point of view:—H. Firenze, Histoire de Belgique (5 vols.); idem, Les anciennes Démocracies des Pays-Bas (English trans.); Cammaerts, Belgium. From the political point of view: H. Van der Linden, History of Belgium; Van der Linden, A Short History of Belgium; C. Descallier, Charles Rogier; P. Hymans, Histoire parlementaire de la Belgique; idem, Frère Orban, Van der Smischen, La Correspondance de Léopold I, and others; Maeder, Belgium; W. van Dijck, La Belgique Moderne; Passeleg, Les déportations des ouvriers belges pendant la guerre. (H. P. ; J. P.)

BELGIAN LITERATURE

It cannot be said that any very extraordinary new talent either in prose or in poetry revealed itself in Belgian French literature between 1910 and 1921.

The name of Maurice Maeterlinck and Emile Verhaeren remained world-wide. Maeterlinck's play L'oiseau Bleu (1911) was first performed at Moscow, then in London (translated as The Blue Bird), and later in Paris and New York. The writer's personality and imagination were so powerful that they made his play increasingly popular. A continuation under the title of The Betrolath was produced in London in 1921.

During the War, Maeterlinck published, in 1916, a volume of articles he had written in various newspapers and lectures he had delivered in England, France and Italy, under the title Les Débris de la Guerre. He also wrote L'Heure Inconnaissable, Le Miracle de St. Autoine, Les Soeurs dans la Montagne (1919) and Le Bourgmestre de Stillemonde (1920), a play dealing with the horrors of the German invasion in Belgium.

Emile Verhaeren's tragedy Hélène de Sparte was first published in German, translated by Stephan Zweig, then in Russian, and appeared in French in 1912, when it was performed in Paris. Verhaeren's forcible and rather rugged style is perhaps not absolutely suited to the subject he treats. His poems, however, Les Rêvêtes Souvenir (1910), Les Villas à Pignons (1919), Les Fleurs du Soir (1911), Les Plaines (1911) and Les Blés Mouvants (1912), are as intense in feeling and vitality as his earlier work. Verhaeren's accidental death (he was crushed by a train in Rouen station Nov. 26, 1916) was a great loss to Belgian literature. La Belgique Sanglante (1918), Parz les Centres forts et les Mauvaises de la Belgique (1918), Les Ailes Roil de la Guerre (1916) have been read and admired all the world over for their ardent patriotism and their righteous indignation as well as for their fidelity of expression. These war poems will live wherever the French language is spoken.

In Les Libertins d'Anvers, Légende et Histoire des Loisirs, Georges Eekhoud has told the story of the heretic sects in Antwerp in the 16th century. In this book Eekhoud, according to his custom, exalts his native city in her vices as well as in her virtues. Other books written by Eekhoud are Les Peintres Animaliers Belges (1911), et L'Imposteur magotinaire, Perkin Warbeck (1914).

A tragedy in four acts by Camille Lemonnier, Édithie, set to music by Léon do Bois, was performed in Antwerp in 1912 with great success. The poem, written in blank verse, has all the charm of Lemonnier's vivid imagination and forcible style. Lemonnier died in 1913. His last book, Au Cœur frais de la Forêt, was published in 1914.

Albert Giraud's La Prise Empourpée (1912) is a collection of poems, in which their author remains faithful to the Parnassian tradition. In 1910 Giraud published a volume of poems, Les Loups, written in Brussels during the war, and in 1920 Épisodes de Poche.

Ivan Gilkin published in 1911 poems called La Nuit, the first of three volumes, of which the others were to be called L'Aube and La Lumière, and in 1920 a play in blank verse, Le Roi Cophetua.

Grégoire Le Roy, in his collection of poems called Le Rouet et la Besace, illustrated by himself, deals with the sufferings of the poor. La COURONNE des SOIRS (1911), Contes d'après minuit (1913) and Joe Trimbom (1913) are collections of short stories.
Jean Dominique (pseudonym of Mlle. Marie Closset), whose volume of poems, *Le Puits d’Azur*, was published in 1912, is undoubtedly one of the most gifted of contemporary women writers. Mlle. Closset is a teacher and lives in Brussels. Another original and interesting woman writer, Nel Doi, has published *Jour de Faim et Détresse* (1911) and *Cones Parcouches* (1913).

A considerable number of books and poems dealing with and inspired by the war were published by Belgian writers in England and France during the war, as well as in Belgium itself after the refugees and soldiers returned home. During the German occupation Belgians had necessarily been debarrèd from publishing works inspired by their patriotic feelings. Besides Verhaeren’s war poems, Emile Cammaerts’ *Belgian Poems* (1913) may be mentioned.

Professor Firenne’s *Souverains de Captivité en Allemagne* (1920) are a notable contribution to Belgian war literature in prose. An interesting book which consists of a series of essays on the war and the German occupation, *L’Œil sur les Ostrogots*, by Ernest Verlant, director of Fine Arts, may live as a record of the impressions of a subtle mind and a cultivated personality. A monthly review *Le Flambeau*, published clandestinely in Brussels during the German occupation, by Oscar Grojean, Henri Grégoire and Anatole Muhlbist, a young Pole, and which continues to appear, edited by Grojean and Grégoire, is without doubt the most interesting literary and political review in Belgium. Amongst contemporary writers and poets in Belgium named, one should be mentioned: Fernand Sérin (La Solitude Heureuse, 1901); Max Elskamp (Sous les Tentes de l’Exode, 1911; Les Commentaires et l’Idéographie du jeu de Loto dans les Flandres, 1914); Georges Raemaekers (Les Saisons Mystiques, 1910); t’Serstevens (Un Apostolat); Blanche Rousseau (Le Rabaga, 1912; Lisette et sa Pantoufle, 1913); Glesener (Chronique d’un petit Pays, 1913).

In 1920 Crommelynck’s play *Le Cucu Magnifique* created a sensation in Paris where it had a long run at the Théâtre de l’Œuvre. In Brussels it obtained more or less of a *succès de scandale*. *Le Cucu* deals with a case of pathological jealousy. Crommelynck’s other plays are *Le Sculpteur de Masques* (1908) and *Les Amants Puérils* (1912). Other Belgian plays include *Kaatje et Malgré Ceux qui tombent*, by Paul Spaak; *Les Élapes, Les Liens et Les Semaillies* (1919) by Gustave van Zype, and *Le Mariage de Mademoiselle Beulemans* by Fonson and Wicheler, a picture of the life of the lower middle class in Brussels.

In Flemish literature there has been marked activity. Stijn Streuvels, a nephew of Guido Gezelle, and by profession a baker at Aveghem, a village in Flanders, has made a considerable reputation both in Belgium and in Holland. His descriptions of Flemish rural life are both poetic and realistic, and he has been compared to Tolstoi, while his sympathetic and epic amplitude Streuvels however does not possess. His style is of rare perfection, and this remark applies to the whole of the modern Flemish school of writers. Streuvels’ work, *Het Glorieryke Licht* (The Glorious Light), was written in 1913. In 1914 he published *Dorpslucht* and in 1920 *Genevoce van Brabant*, a historical novel.

Cyril Buyse may be called the Flemish Maupassant. He is a realist. His works, which deal with the life of the people both in towns and in the country and, to a lesser degree, with that of the middle classes, form a complete picture of Flemish life. Buyse is passionate, robust, full of revolt and of pity; very human. His *De Vroolyke Tochti* (The Joyous Expedition), *Stemmingen* (Impressions), and in collaboration with Virginie Loveling, a popular woman author, *Levensleer* (Education through Life) appeared between 1910 and 1912. In 1915 Buyse published *Zomerleven* (Life in the Summer), a sort of diary, and in 1921 *Zoools Het Was* (As It Was). Maurice Sabbe’s *De Nood der Barisees* (The Plight of the Barisees), in *1’ Gedroog* (1915, a book about the war), and *1’ Pastorke van Schaerdycke* (1918, The Little Pastor of Schaerdycke) and E. Vermeulen’s *Hermansing* (Renaissance), which deals with the life of the peasants in West Flanders, may also be mentioned.

René de Clercq and Karel van de Woestyne are the most typical Flemish poets of the present generation. René de Clercq proceeds directly from the inspiration of Guido Gezelle (1830–89). His poems are essentially popular, vigorous, full of life and good spirits, although through these one feels his tenderness, his pity for the misery of the Flemish peasants. He has published a volume of *Godichèn* (Poems). Karel van de Woestyne has a more complex personality. His poems are very varied in feeling, sometimes simple and direct, at other times complicated, full of metaphors. His sphere is that of the soul, and for him things are real in so far only as they partake of the spiritual life. It is necessary to add that there are contrasts in Van de Woestyne’s nature: he does not always dominate, and which give a certain want of harmony to his works. A volume containing prose essays on Flemish painters and writers is *Kunst en Leven in Vlaanderen* (Art and Life in Flanders). A volume of poems and poems of the book *De gemene Schaduw* (A common Shadow). In 1920 Van de Woestyne wrote a book in poetic prose, *Wijk in de duinen*, called *De Bestendige Aangezicht* (The Eternal Presence), and in 1920 a volume of poems *De Modderden Man* (of which the nearest translation is *The Man of Clay*), the first volume of a trilogy. A new Belgian Flemish writer of outstanding importance is Felix Timmermans, who before he became celebrated in Belgium and Holland, sold sweets in a little shop in his native town of Lierre. *Polliter* (1916) is epoch-making in contemporary Belgian literature. It is as forceful as Rabelais and yet tender and poetic, with a pantheistic feeling for nature: the ecstasy of a human being who incorporates himself with woods and streams, flowers and beasts, and who revels in every form of life. One may say that this book takes an important place in European literature. It had already reached 12 editions in 1921, and a French translation was then about to appear. Another book of Timmermans, *Het Kindkeden Jesus in Vlaanderen* (1918, The Christ Child in Flanders), is a most poetical transplantation of the story of the childhood of Christ. This has already been done in Belgian French literature by Eugène Demolder. But whereas Demolder’s book is full of literary devices Timmermans’s comes as it were from the heart of the people. Another Flemish prose writer is Herman Terck: *De nieuwelied* (1920, The New Eulenspiegel), a fantasy; and amongst the best-known recent poets Auguste van Cauwaert, Frits Francken and Daan Boens may be mentioned. Cyrill Verschehoven has written a dramatic poem *Judas*, and Eug. Schmidt a play *Het Kindernummer* (a turn performed by a child at a music-hall).

L. V.A.

**BELL, CHARLES FREDERICK MOBERLY** (1847–1911), British journalist, was born in Alexandria April 2, 1847, the son of a merchant. He was educated in England, but in 1865 went back to Egypt and engaged in business. He soon came to be considered a man of influence and the French. *The Times* and from 1875 onwards devoted himself mainly to journalism. By 1880, when he founded the *Egyptian Gazette*, he had become the regular correspondent for *The Times* in Egypt. He also published *Khedives and Pashas* (1884); *Egyptian Finance* (1887) and *From Pharaoh to Felah* (1888). In 1890 he was summoned to London to take the post of manager (nominally assistant-manager) of *The Times*, at a time when it had suffered heavy financial losses over the proceedings connected with the Farrell Commission (see 20.589). From that date he devoted all his energies to *The Times*. The journal *The Times* Publishing Co. was founded in 1906, and the financial control passed from the Walter family to Lord Northcliffe, he became managing director. He died suddenly whilst at work in *The Times* offices April 5, 1911.

**BELL, GERTRUDE MARGARET LOWTHIAN** (1868– ), English traveller and geographer, was born at Washington, Durham, July 14, 1868, the eldest daughter of Sir T. Hugh Bell, Bart. She was educated at Queen’s College, London, and Lady Margaret Hall, Oxford, where she graduated first class in the final school of modern history in 1888. She travelled extensively in the Near East, making a specially adventurous journey across northern Arabia in 1913–4 over a practically unknown route, whereby she obtained a knowledge of the country which...
proved of great value to the British Government when information concerning routes was required for the advance of the British army into Palestine during the World War. In 1914-5 she was in control of a special department of the British Red Cross, occupied in trying to trace soldiers reported as "missing." From 1916-7 she was attached to the Admiralty Intelligence Office in Cairo. In 1917 she went with the military authorities to Jerusalem and followed the army up to Bagdad. In 1918 she subsequently acted as assistant political officer to the first woman to occupy so important an administrative post. In 1918 she received the founder's medal of the Royal Geographical Society.

Amongst her publications are: *Poems from the Dvain of Hafiz* (translations, 1897); *The Desert and the Sown* (1907); *The Thousand and One Nights* (in Persian, 1909) and *The Mosque at Uhaulia* (1914). She is also the author of the Review of the Civil Administration of Mesopotamia, issued as a White Book by the India Office. Dec. 1920.

**BELLEW, HAROLD KYRLE** (1857-1917), English actor, was born in Lanes, in 1857. He first appeared on the stage in Australia in 1874, afterwards coming to London and acting for two years with Irving at the Lyceum from 1878 to 1880. He had the reputation of being the handsomest man on the contemporary stage. In 1888 he joined Mrs. Brown-Potter in a tour round the world, and for the last ten years of his life played romantic and modern comedy parts in the United States. He died at Salt Lake City, Utah, Nov. 1 1911.

**BELLOC, HILAIRE** (1870- ), British man of letters, was born near Versailles July 27, 1870. His father was a Frenchman; his mother, Mrs. Berthe Brown Potter, took an active share in the woman's-suffrage movement (see 28,787). Educated at Eidsgaston, he served as a driver in the 8th Regiment of French artillery before proceeding to Balliol College, Oxford. At Oxford he was prominent both in his schools and at the Union, and soon became known as a clever writer and speaker. He sat in the House of Commons for Salford from 1906 to 1910 as a Liberal. His very numerous writings include verse, children's books, essays, biography and fiction, as well as military history. Amongst them may be mentioned *Danton* (1899); *Robespierre* (1903); *The War in Russia* (1903); *Esto Perpetua* (1906); *Contemplation Tales* (1907); *Mr. Clutterbuck's Election* (1908); *A Change in the Cabinet* (1909); *Marie Antoinette* (1910) and *A General Sketch of the European War* (1915-6).

His sister, MARIE ADELAIDE BELLOC-LOWNDES (b. 1868), who in 1866 married Frederick Sawrey Lowndes, a member of the staff of *The Times*, also became well-known as the author of numerous novels and short stories, including *The Pulse of Life* (1907); *The Uttermost Farthing* (1908); *Studies in Wives* (1909); *The Chink in the Armour* (1911); *The Lodger* (1913), etc. Dramatized versions of the last two, by H. A. Vachell, were played in London as *The House of Peril* (1910) and *What is He?* (1915). She published besides a biography of Charlotte Elizabeth, Princess Palatine (1889) and *Told in Gallant Deeds*, a history of the World War for children (1914).

**BELOW, FRITZ VON** (1853-1918), German general, was born Nov. 23 1853 at Danzig. He took part in the war of 1870-1 as a young officer. In 1912 he was appointed to the command of the XXI. Army Corps. In this capacity he fought with the VI. Army on the western front at the beginning of the World War, but his corps was transferred in 1915 to the eastern front. In 1916 he was chief in command of the I. Army, which fought with success in Nov. 1916 on the Somme. He died in a field hospital on the western front in Nov. 1918.

**BELOW, OTTO VON** (1857-1917), German general, was born at Danzig June 18 1857. At the beginning of the World War he was in command of the 2nd Infantry Div. at Interburg in East Prussia. He was first of all promoted to the command of the I. Reserve Corps, and in this capacity took part in the battles against the Russian army of the Narva which resulted in the almost complete destruction of that army. He was then appointed to the chief command of the VII. Army which bore an essential part of the victory over the Russian X. Army at the battles of the Masurian Lakes (Feb. 7-15 1915). In May 1915 he was placed in chief command of the German Niemen army and pressed forward with it in Courland (Kurland) and Lithuania as far as the southern reaches of the Divina. In the autumn of 1916 he received the command of the German army group in Macedonia and in the autumn of 1917 was placed in chief command of the XIV. Armee Korps, which was fighting against Italy. In 1918 he led the XVII. Army Corps and particularly distinguished itself in the battles around Arras. After the war he was for a short period general in command of the XVII. Army Corps at Danzig. He resigned in June 1919.
BENEDICT XV.—BENSON

tangible result, and the historic rapprochement between Great Britain, France and Russia took its course. Benckendorff in London was excellently placed to keep up to and to develop this policy. Liberal, courteous, a shrewd observer, loyal and watchful in the cause of Russia, he maintained the best possible relations with Lord Lansdowne and Sir Edward Grey, and became a favourite at Court and in London society. He was peculiarly adapted for the wise and skilful treatment of difficult problems in the spirit of an international set, playing the great game of diplomacy with grace and honour. He had to face the dominant fact of the situation—the aggressive pressure of Germany at a time when Russia was drifting into an internal crisis of the first magnitude and was unable to concentrate the material and moral forces required in the coming conflict. Unpleasant retreats had to be effected twice, before the Kaiser “in shining armour”, the first time after Aehrenthal’s annexation of Bosnia-Herzegovina, the second after the blocking of the Serbians advance towards the Adriatic. Benckendorff was one of those who knew how to abide his time, and he did not lose heart. There were greater trials in store when the World War broke out at last. His younger son fell in one of the first battles on the East Prussian front, and he lived to see the collapse of the corrupt military organization of Russia in the campaign of 1915. Fortunately for him, he did not live to see the débâcle of Russian society in 1917. He died Jan. 11, 1917.

BENEDICT XV. (GIACOMO DELLA CHIESA), Pope (1854— ), was born at Genoa on Nov. 21 1854. In contrast to his immediate predecessor Pius X., who was of humble origins and whose ministerial experience was mainly pastoral, Benedict XV. was descended from one of the most ancient of the noble families of Italy, and his work and training had been chiefly in the official or diplomatic service of the Holy See. His ancestors in the Middle Ages were enrolled in the patricians of Genoa, while other branches of his family followed the popes to Avignon in the 14th century, and eventually their sons took service in the army of the king of France, under the name of d’Egise. His brother served as rear-admiral in the Italian navy.

Giacomo della Chiesa was educated in the seminary and at the university of Genoa, where he took his degree as Doctor of Law in 1875. Afterwards he went to Rome and studied for the priesthood in the Collegio Carpinacca from which he passed to the Accademia dei nobili Ecclesiastici, the usual training school for those who devote themselves to the “carriera” or diplomatic service of the Vatican. He became here the friend and favourite of Cardinal Rampolla who, on being sent in 1883 as papal nuncio to Madrid, took Mgr. della Chiesa with him as his private secretary. He remained in Spain four years, and in 1887, when Leo XIII. recalled Cardinal Rampolla to make him his secretary of state, Mgr. della Chiesa returned to Madrid as his private patron, and was given the post of ministrante in his department.

In this, his work was the summarizing and indenting of the official letters and dispatches of the Holy See, combined with the functions of confidential secretary. As he discharged these duties for 13 years, he had a full opportunity of acquiring a unique knowledge of the international relations of the Church throughout the world. In 1903, when Cardinal Merry del Val succeeded Cardinal Rampolla as secretary of state, Mgr. della Chiesa was retained in his post. On Dec. 16 1907, Pius X. appointed him Archbishop of Bologna, and on May 25 1914 raised him to the dignity of cardinal. The outbreak of the World War in Aug. of that year, and the death of Pius X. a few weeks later, found him in the midst of the pastoral duties of his great diocese. At this time, as Cardinal-Archbishop of Bologna, he delivered a remarkable address on the attitude and duty of the Church during the war, and strongly emphasized the paramount importance of the Holy See observing strict neutrality, not of indifference, but of impartiality, while leaving nothing undone to restore peace and good-will and to mitigate suffering. The address caused a deep impression. It was no doubt much in the minds of the cardinal when they assembled in conclavo for the election of a new pope on the last day of Aug. 1914. On Sept. 3, after 10 scrutinies or voitings, Cardinal della Chiesa was elected by a large majority, and was proclaimed from the balcony of St. Peter’s as Benedict XV.

BENNETT, CHARLES EDWIN (1858-1921), American classical scholar (see 3.740), died May 2 1914 at Ithaca, N.Y. His later publications include Syntax of Early Latin (two vols., 1910, 1914); New Latin Composition (1912) and Horace’s Odes and Epodes (1914, in the Loeb Classical Library).

BENNETT, Enoch Arnold (1867-), English novelist and playwright, was born in the Potteries district, Staffs., May 27 1867. Educated at Newcastle-under-Lyme, he was intended for the law, but abandoned it in 1893 for journalism. He was assistant-editor and then editor of the periodical Woman, but in 1900 gave up journalism and became a prolific writer of books, especially novels illustrating the life of his native district, early examples of which were Anna of the Five Towns (1902) and The Girl of the Smiles of the Five Towns (1907). In 1912 he established his reputation as a novelist with The Old Wives’ Tale, followed by the series Clayhanger (1910); Hilda Lessways (1911) and, much later, The Roll Call (1916). But he also adventured into other genres of fiction, sensational, humorous and ironic, of which The Grand Babylon Hotel (1902); Sacred and Profane Love (1905, dramatized 1919); Buried Alive (1908); The Card (1911); The Regent (1913); The Lion’s Share (1916) and The Pretty Lady (1918) are examples. His plays, especially The Great Adventure (dramatized in 1913 from the novel Buried Alive); What the Public Wants (1909); The Honeymoon; (1911); Milestones (with Edward Knoblock, 1912) and The Title (1918) showed him a master of modern comedy and he also produced in Judith (1919), a modernized version of the biblical story. In 1920 he published Our Women, a series of essays on modern feminine types and feminist problems.

BENNETT, James Gordon (1841-1918), American newspaper proprietor (see 3.741), died May 14 1918, in Paris, whence he had long directed the policies of the New York Herald. In his will he provided for the establishment of “The James Gordon Bennett Memorial Home for New York Journalists,” in memory of his father, the founder of the New York Herald.

BENSON, Arthur Christopher (1862- ), English man of letters (see 3.745), was in 1915 elected master of Magdalen College, Cambridge. Among his recent books are Ruskin: a Study in Personality (1911) and biographies of his brother Hugh: Memoirs of a Brother (1915) and of his sister Life and Letters of Maggie Benson (1917), besides various volumes of essays and prose sketches.

His younger brother, Edward Frederick Benson (1867- ), published after 1910 a large number of novels, amongst which may be mentioned Thorsley Wein (1913); Dodo the Second; The Long Ships; In the Haunted Hotel; Mr. Teddy; The Countess of Lowndes Square (1926). He also wrote a one-act comedy, Dinner for Eight, which was successfully produced at the Ambassadors’ theatre, London, in March 1915.

The youngest brother, Robert Hugh Benson (1871-1914), died at Salford Oct. 10 1914. In 1912 he was appointed private chamberlain to Pope Pius XI. His later books include The Dawn of All (1911), a curious forecast of England under Catholic government; Come Rack! Come Ropel (1912); An Average Man (1913) and Initiation (1914).

BENSON, Sir Francis Robert (1858- ), English actor, (see 3.745), was knighted in 1916. During the World War he served for over two years as an orderly in a canteen managed by Lady Benson, first near Belfort and later at St. Just and near Sens. In 1918 he was attached as an ambulance driver to various French regiments engaged in the Somme and Aisne campaign, and he received the Croix de Guerre on the battlefield near Oudenarde.

BENSON, William Shepherd (1855- ), American naval officer, was born at Macon, Ga., Sept. 25 1855. He graduated from the U.S. Naval Academy in 1877, and after various promotions became captain in 1909 and rear-admiral in 1915. He has been commander of the Philadelphia Naval Yard two years when, in 1915, he was appointed chief of naval
operations. He was a member of the commission appointed to confer with the Allied Powers in 1917, naval representative in drawing up terms of the Armistice, and naval adviser to the American Peace Commission. He was retired automatically in 1919 and made admiral for life.

**BENTLEY, JOHN FRANCIS** (1839-1902), English architect, was born at Doncaster in 1839, and commenced his career as an engineer, later passing three years in a builder's office, a course of practical training the benefits of which are evident throughout his work. He subsequently entered the office of Henry Clutton whose practice was very largely in an ecclesiastical direction, and where young Bentley's bias towards that French Gothic treatment of design, by which his earlier work was distinguished, found support and encouragement. Established on his own account in 1862, commissions flowed in for work not only of an architectural nature but also giving scope for his talent in designing for the subsidiary arts, such as stained glass, goldsmith's work, embroidery and the like. His earliest important undertaking was the enlargement and decorative treatment of St. Francis' church, Notting Hill, followed by others in various parts of the country. In his later years he shows an increasing tendency towards a more English form of expression in his design. The beautiful seminary of St. Thomas at Hammersmith, noteworthy not only for its architectural treatment but, as usual with Bentley, for a carefully conceived and thought-out plan, was followed by St. John's school at Beaumont, one of the best examples of his power to deal with design based on English Renaissance of the 17th century. For many years he was occupied in the completion of Carlton Towers, the seat of Lord Beaumont, left unfinished on the death of E. W. Pugin. On the decorative work of this fine building he spent during the 15 years he was engaged on it an immense amount of thought and invention, and with marked success. A very excellent example of Bentley's skill in adapting mediaeval ideals to the circumstances of our times, while yet infusing them with an individuality that lifts them above the level of sheer copyism, is to be found in Holy Rood church, built by him 1862, in which, as regards the interior, he gave free rein to his sense of colour as a final complement of his design.

It was after 30 years of strenuous work at his art, and in his 56th year that Bentley—his claims strongly supported by the most eminent of his fellow architects—was appointed by Cardinal Vaughan as architect of the proposed Roman Catholic cathedral in Westminster, his unremittting and enthusiastic labour upon which occupied the remainder of his life. Already, before his selection by the authorities, it had been decided that for the new building it would be far from desirable to adopt Gothic principles and traditions. The principal factor in coming to this conclusion was the obvious danger of an unpleasant competition, both as regards size and aesthetic treatment, with the closely neighbouring Westminster Abbey. To equip himself thoroughly for dealing with the problem in terms of the Byzantine style settled upon, Bentley determined, as a preliminary, to study his subject at first hand in Italy and Constantinople, and in 1894 he spent several months in northern Italy and Rome with this end in view. From a series of sketch plans prepared on his return was gradually evolved that adopted for the cathedral as now built, a masterly treatment of a difficult problem. The exterior dimensions of the building are 360 ft. in length by 150 ft. in width, the interior of the nave being 232 ft. long, and 60 ft. wide. The three bays into which its length is divided are covered with saucer-shaped domes 112 ft. in height, and sprouting from enormous piers. The aisles, narrow, as being used for professional purposes only, give on to the seven side chapels. The truly imposing character of the building was perhaps more to be appreciated when its walls, piers and arches were in their undecorated state, and full value was given to its 342 ft. of length, and to a vast nave higher and wider than any in England. It was always intended that the whole of the inside wall and arch surface should be clothed with marble and mosaic, and to no one could so sumptuous a manner of vesting his building in rich apparel appeal more than to Bentley, and in no hands could it have been placed with more hope of success. There was, however, much difficulty in arriving at a scheme for the comprehensive treatment of the whole of the vast building, which should be devotional and symbolic, and above all possess a unity of conception. Bentley himself prepared a very thoughtful and complete proposal, partly embodied in the mosaics so far executed, but, unfortunately, only partly so.

In May 1868 he visited the United States to consult as to the building of a cathedral at Brooklyn, and for this he prepared a design, in which he, this time, reverted to Gothic, for which he left incomplete at his death. He died after seeing all but carried into effect and full realization his dream of a church building which should in a grand manner show forth all of the beauty and holiness of that religion to which he had as a young man given himself, and which was throughout his life, in all the work of his thought and inspiration. On the eve of being presented with the gold medal of the Royal Institute of British Architects he died at Clapham March 2 1902.

**BERCHTOLD VON UND ZU UNGARISCHT, LEOPOLD, COUNT** (1863- ), Austro-Hungarian statesman. The Berch- 
told are a Moravian noble family whose patent of knighthood and nobility of the empire dates from 1616. They became counts in 1673, and acquired their Hungarian rights in 1751. Count Leopold Berchtold, born April 18 1863, was employed first in the Moravian Government, entered the service of the Austro-Hungarian Foreign Office in 1893, and in 1894 was attached to the Paris embassy. In 1903 he was made councillor of legation to St. Petersburg, and in Dec. 1906 was appointed ambassador there. With the Russian court and the aristocratic society of St. Petersburg he maintained the best relations, but failed entirely in his zealous efforts to accommodate the obviously increasing differences between Russian and Austro-Hungarian policy. He took a leading part in the negotiations preceding the crisis caused by the annexation of Bosnia-Herzegovina, which aimed at securing common action of the two powers in the Balkan question. It was at his château of Buchlau, in Moravia, that the fateful conference took place between Ilovski and Aehrenthal (Sept. 15 1908). At the time of the strained relations between the Cabinets of St. Petersburg and Vienna, which followed the annexation, and under the shadow of the personal feud between the two foreign ministers, the position of Berchtold at St. Peters-
burg was extremely difficult. For months together he had to avoid all official intercourse with the Russian Foreign Office; and it was not till the spring of 1909, when the violence of the quarrel had abated, that he could resume his efforts to improve the relations between the two states. His success was only temporary; the tension, indeed, for a time relaxed; but gradually it increased, and during the last months of his residence in St. Petersburg became extreme. In March 1911 Count Berchtold was recalled from Russia, and on Feb. 17 1912 he was, against his own will, appointed Aehrenthal's successor as Foreign Minister.

His efforts were primarily directed towards securing the position of Austria-Hungary in the Balkan Peninsula. He wished to bind Bulgaria more closely to the Triple Alliance; to strengthen the ties of the Habsburg Monarchy with Rumania and Turkey; to foil the aspirations of Serbia for an extension of territory. To the idea of solving the questions at issue with this latter power with the sword he was at this time opposed, con-
vinced that it was in the interest of the Balkan peninsula to agree with Russia and the Western Powers. In this sense he spoke at the first session of the Delegations in which he took part as Foreign Minister. But the increasingly obvious efforts of Russian statesmen to weaken the influence of Austria-
Hungary in the Balkans, the aggressive activities of the Serbs, and the ambiguous behaviour of Bulgaria forced him to change his attitude, especially as he failed to receive from the Western
Powers the support which he had sought from them. In Oct. 1912, at a meeting at San Rossore, he came to certain agreements with the Italian Foreign Minister, San Giuliano, of which the objects were to secure the autonomy of Albania and to counter Serbia’s plan for an extension of her power in the Adriatic coast-lands. The renewal of the Triple Alliance followed at the beginning of December.

Meanwhile the struggle between Turkey and the Christian nations of the Balkans had broken out. During the three Balkan wars, fought between Oct. 1912 and Aug. 1913, Berchtold’s attitude was a weak one. He repeatedly took steps towards active intervention, but drew back when the Entente Powers used threats and the other members of the Triple Alliance intervened with counsels of moderation in Vienna. His efforts at the close of the third Balkan War to secure a revision of the Treaty of Bucharest (Aug. 10 1913), which was unfavourable to Bulgaria, were as unsuccessful as his attempts to secure an accommodation between Bulgaria and her rivals by way of direct negotiation. The prestige of Austria-Hungary in the Balkans noticeably declined. Serbia’s endeavours to extend her power to the Adriatic, and to win recruits for the ideal of Great Serbia among the kindred Slav races of Austria-Hungary, became more and more evident and pressed for a decision. For these reasons, at the conferences at the Ballplatz which followed the murder of the heir to the throne, the Archduke Francis Ferdinand, on June 28 1914, Berchtold maintained the view that a definitive settlement with Serbia was essential, even at the risk of war with Russia and France. He did not seek at that time to have recourse to the possibility of an active participation of Great Britain on the side of the opponents of the Triple Alliance.

After the outbreak of the World War he directed his efforts to inducing Italy and Rumania to carry out their obligations and to securing new allies for the Central Powers. These efforts were for the most part unsuccessful. Turkey alone joined the Central Powers. Rumania and Italy declared their neutrality; even Bulgaria dragged out the negotiations, though Berchtold offered great concessions in return for her active intervention on the side of Austria-Hungary and Germany. Italy’s demands for compensation were indeed acknowledged in principle by Berchtold, under pressure from Germany, but he embarked on the negotiations with hesitation, and down to the day of his resignation he refused to listen to any proposal for the cession of territory which had long been under Austrian rule. In the course of the war Berchtold came into conflict with German statesmen and the German Supreme Army Command. He thought that Germany did not give sufficient support to her ally in the severe struggle against the superior strength of Russia, and protested strongly against the readiness with which Germany had agreed to the territorial and other demands of Rumania and Italy. The reasons of his fall, which took place on Jan. 13 1915, are still obscure, but it is certain that the attitude of Stephan Tisza and his adherents, from the autumn of 1914, in refusing to cooperate with him was a contributory cause. In March 1916 Berchtold was appointed Oberhofmeister (Lord High Steward) to the heir to the throne, Charles Francis Joseph, whom he subsequently served as Oberkämmerer (Lord High Chamberlain). After the fall of the dynasty he took no part in politics.

BERENGER, RENÉ (1830–1915), French lawyer and political figure (see 3.725), who was raised to the peerage in 1916, died in London Sept. 6 1919.

BERESPORD, CHARLES WILLIAM DE LA PEO BERESPORD, 1ST BARON (1846–1919), British admiral (see 3.775), who was raised to the peerage in 1916, died in London Sept. 6 1919.

BERGWALD, FREDERICK HENRY (1859– ), French philosopher, was born in Paris Oct. 18, 1859. Educated at the Lycée Corot, and the École Normale he was successively professor of philosophy at the Lycée d’Angers 1881–3, at the Lycée de Cler- mond 1883–8, at the Collège Rollin 1888–9, at the Lycée Henry IV. 1889–97, at the École Normale Supérieure 1897–1900 and at the Collège de France 1900–21. In 1912 he was Gin ford lecturer at Edinburg. Of the three works which constitute together the full exposition of his interpretation of experience, Les Données Immédiates de la Conscience was published in 1889, Matière et Mémoire in 1896, and L’Evolution Créatrice in 1907. The English translations (Time and Free Will, Mind and the Framework of Experience) appeared from 1907 to 1910–1. He had published also Le Rire (1900). With the exception of a pamphlet, La Signification de la Guerre (1915), nothing more appeared until L’Énergie Spirituelle (1919), with Eng. trans. Mind-Energy (1920).

For a discussion of his work, see PHILOSOPHY.

BERLIN (see 3.783).—Since 1910 the city of Berlin (pop., Greater Berlin 1910 census, 1,902,509; 1920 census 2,071,257) has undergone a very considerable development in respect of the form of its municipal organization. The rapid growth of the suburbs, which were independent communities, necessitated the adoption of certain main lines of procedure, applicable both to them and to Berlin, in order to prevent conflicting action on the part of the authorities on one side and the other. This led, in 1911, to the creation of Greater Berlin as, in the first instance, an association of the city with the more important outlying districts for special objects. It embraced the city of Berlin and the towns of Charlottenburg, Schöneberg, Neukölln, Wilmersdorf, Lichtenberg and the administrative circles of Teltow and Niederbarnim. Its objects were to institute a common control of streets, roads and the elevated railway, also of building and street alignment plans, the uniform coordination of police regulations and the acquisition of large tracts of forest and of land for building. This special union came into force on April 1 1912. It soon became manifest, however, that beyond cooperation for special purposes, a further coordination of the administrations of these places was requisite. It was only in the year 1920 that it was possible, after long negotiations, to form a new municipality of Berlin, embracing all the suburbs under a single united administration. A law to this effect was carried through the Prussian Constituent Assembly on April 27 1920 and was put into force on Oct. 1 of the same year. This law effected the centralization of Berlin and all its suburbs into one uniform municipal region (Stadtbezirk), but not the centralization of large powers of local self-administration to the individual communes (Gemeinden).

On May 15 1912 the former Secretary of State for the Treasury of the Empire, Wernmuth, was elected chief burgomaster of Berlin in place of Kirschner, who had resigned. Under his administration, which lasted till Nov. 25 1920, the city experienced notable developments. The first was the creation of a new municipality. In June 1914 the ship canal unifying Berlin with Stettin was inaugurated. In the same year the city acquired the estate of Lanke, thus securing extremely valuable land for settlement purposes. In Oct. 1914 the city purchase of Berlin Elephants’ Park was completed for $1,902,509 (pre-war value about $6,400,000). The years of the war necessitated the vigorous intervention of the municipal administration in order to keep the population supplied with food and other necessities of life. A special commission for food supplies was appointed as early as 1914. In 1914 the supply of meat, vegetables, milk, etc., by the municipality was instituted. The management of all these supplies necessitated the appointment of a host of officials. The establishment of the War Departments of the empire and of Prussia as well as of the city thus entailed an accession of population which by 1917 had caused a great dearth of house accommodation, a situation which increased when the municipal offices for enabling the public to obtain dwellings had to be established under municipal supervision. Even in 1921 it was almost impossible to find a flat. The general necessities arising out of the war included vast expansion of the city, which its financial position had by 1921 become extremely unfavourable, while municipal taxation had been about trebled.
centre of the city. The number of those who were killed in the street fighting was 1,175. The last victims of the revolution met their death on Jan. 13 1920 when a mass of people incited by Socialist propaganda, in connexon with the parliamentary debates on the Industrial Councils bill (Btriebsratesgesetz), attempted to storm the Reichstag building. There were 42 killed and 105 wounded. The Kapp Putsch in March of the same year was likewise attended by some Socialist speeches, and resulted in a general strike poscd by the Socialist parties and the working-class leaders in order to put an end to Kapp's usurpation of power.

As a result of the assimilation of the municipalities to the parliamentary franchise a large Left majority composed of Social Democrats, Independent Socialists and Communists was elected to the Municipal Council of Greater Berlin. The Berlin school system was presently regarded by the sense of the extreme socialists, a change which the non-Socialist parties were in 1921 still vigorously combating. The workmen employed by the municipality and the tramwaymen constantly demanded higher wages, which even the extreme Left majority in the Council were unable to concede, so that strikes in the electricity and gas works and cessation of work on the tramway lines were of frequent occurrence. Gradually, however, the economic life of Berlin seemed by 1921 to be entering upon a period of greater regularity. Chief Burgomaster Wermuth was succeeded in Nov. 1920 by the former city treasurer, Boss.

BERNHARDI, FRIEDRICH VON (1839— ), German military leader and writer, was born Nov. 21 1839 at St. Petersburg. He entered the army of the year of the war of 1870-1 as a young officer in the 14th Hussars. When the German troops entered Paris in March 1871 he was the first German to ride into the city. From 1891 to 1894 he was German military attaché at Berne and was subsequently head of the military history department of the Grand General Staff in Berlin. He was appointed general in command of the VII. Army Corps at Münster in Westphalia in 1897, but retired two years later and busied himself as a military writer. Wide-spread attention was excited by the memoirs of his father, the diplomatist and historian, Theodor von Bernstein, which he published, and made more accessible in his celebrated book Germany and the Next War which appeared in 1912. On the outbreak of war in 1914 he was again placed at the head of an army corps and fought with success first on the Stochod, where he stove the bridgehead of Tsarrezee and afterwards on the western front, in particular at Armentières.

BERNHAUS, SARAH [ROSENE BERNHAUS] (1845— ), French actress (see 3,801), made a specially successful tour in America in 1906. In 1909 she played Jeannne d'Arc in Paris. In 1910 she again toured in America. In 1913 she was given the Crescent Legion of Honour. Bernhardi, which he published, and still at Zurich because, owing to the anti-socialistic legislation, free expression for its views could not be found in Germany. He was expelled in 1888 and migrated to London, where he lived in intimate intercourse with Friedrich Engels and other followers of Karl Marx. He returned to Germany in 1901 and was elected deputy to the Reichstag for Breslau, a seat which he continued to hold till 1907. His numerous published works include: "Die Voraussetzungen des Sozialismus und die Aufgaben der Sozialdemokratie" (1893); "Die Kommunistischen und Demokratisch-Socialistischen Strome in England während des 17ten Jahrhunderts" (1905); "Zur Geschichte und Theorie des Sozialismus" (1906); "Ferdinand Lasalle und seine Bedeutung für die Arbeiterklasse" (1904); "Sozialismus und Demokratie in der grossen Englishen Revolution" (1908) and an edition of Lasalle's speeches and writings with a biographical introduction (3 vols., 1893-9), etc. In these he dealt principally with the theoretical and historical aspects of socialism. In 1903 he edited the monthly publication Dokumente des Socialismus and in 1904 the weekly Das Neue Monatsblatt. In the conflict between the orthodox Marxists and the revisionists Bernstein was one of the foremost champions of the latter. His differences with Kautsky, the literary protagonist of the strictest sect of the Marxians, were gradually healed after Bernstein, like Kautsky, associated himself with the Independent Socialists in 1915, and still more when both of them broke with the extreme Independents, the self-styled Communists, who advocated government by councils on the Moscow pattern and the "dictatorship of the proletariat." Immediately after the revolution Bernstein was appointed Secretary of State for the Treasury, an office which he held till Jan. 1919. He had again been a member of the Reichstag from 1912-19. Subsequently he left the Independents and returned to the fold of the governmental German Social-Democratic party.

BERNSTORFF, COUNT JOHANN HENRICH VON (1862— ), German diplomatist and politician, was born in London Nov. 14 1862, the son of the Prussian diplomatist Count Albrecht von Bernstorff. He entered the diplomatic service in 1899, was secretary of legation successively at Belgrade, Dresden, St. Petersburg and Munich, and (1900-9) of the Grand duchy of Baden in London. He then went as consul-general to Cairo, whence he proceeded as German ambassador in 1909 to Washington and remained there until America's declaration of war against Germany in April 1917. He made great efforts to facilitate mediation by President Wilson, but he did not receive the support he expected from authoritative quarters in Berlin. He himself has repudiated any active connection with the criminal plots and intrigues which were conducted by German agents, including the German military attaché, Boy-Ed, in America before the rupture of relations; he also maintains that he entirely disapproved of the German foreign policy, Zimmermann's, monstrous proposals to Mexico. If so his position must have been an exceedingly difficult and anomalous one. On the American declaration of war he returned to Germany and was sent as ambassador to Constantinople, where he was employed until 1918. In various publications he has endeavoured to prove that Germany, if she had followed the proper policy, could have avoided war with America. This statement of his views excited much controversy in his own country. When the revolution broke out Bernstorff left the diplomatic service, but has since taken an active part in parliametary politics as a member of the Democratic party in the Reichstag, and has also maintained a close connection with the international press and with pacific post-war propaganda.

(3,801)

BERTHELOT, HENRI MATTHIA (1861— ), French general, a son of the chemist, Marcellin P. E. Berthelot (see 3,801), was born at Feurs (Loire), Dec. 7 1861. At 20 years of age he entered St. Cyr, and in 1883 was appointed a sub-lieutenant in the 1st Regt. of Zouaves. Three years later he was promoted lieutenant. In Nov. 1891 he was made a captain and was transferred to the 90th Inf. Regiment. In 1907 he became a Lieutenant-colonel and in 1914 of the 23rd Inf. Regiment. He was then given a staff appointment, being promoted colonel in June 1911. In Dec. 1913 he was made a general of brigade. On the outbreak of the World War he was appointed head of the French operations staff at headquarters, and in this capacity he exercised a very marked influence on the course of events in Aug. 1914, so much so as to expose him later to the reproach of having been "the irresponsible commander-in-chief" during the disastrous battle of the Frontiers. In Nov. of the same year he was given command of a division. In Aug. 1915 he became commander of the XXXII. Army Corps, an appointment which he retained until Sept. 1916, when he was made chief of the French military mission to Romania. Here his thoroughness was the principal factor in revising the Rumanian army, and the fruits of his work appeared in the campaign of 1917. In June 1917 he was made a grand officer of the Legion of Honour. After a brief mission to the United States he was, in July 1918, given command of the V. Army. This army he commanded in the battles on the Marne.
and the Aisne, which initiated the final Allied offensives. Later, he was sent on a mission to the Balkans. In Oct. 1919 he was made governor of Metz.

BERTHELOT, PHILIPPE JOSEPH LOUIS (1866–1914), French diplomat, was born Oct. 9, 1866, a son of Marcellin Berthelot, the famous chemist and politician (see 3.811). After having passed through the regular stages of a diplomatic career, he was sent on a mission to the Far East in 1902, and returned to the Foreign Office to mount the hierarchical steps of promotion, martyr to which, by reason of his appointment as chef de cabinet, he was able to take at a single bound. He acted as Brial's right-hand man throughout his term of office as Minister of Foreign Affairs and prime minister; became Clemenceau's trusted adviser during the World War and the Peace Conference, and succeeded Jules Cambon, with the rank of an ambassador, as general secretary of the Ministry of Foreign Affairs.

BERTIE, FRANCIS LEVESON BERTIE, 1st Viscount (1844–1919), English diplomatist, was born at Wytham Abbey, Oxon., Aug. 17, 1844, the second son of the 6th Earl of Abingdon. He was educated at Eton, and in 1863 entered the Foreign Office. In 1874 he married the daughter of the 1st Earl Cowley. He was sent to Berlin in 1875, and in 1883 was secretary to the Duke of Fife's mission to invest the King of Saxyony with the Garter. In 1894 he became assistant Under-Secretary for Foreign Affairs, a post which he retained till 1903. He was then appointed British ambassador to Italy, but remained in Rome for only a year, being appointed in 1905 ambassador to France. The Anglo-French agreement had been signed in 1904, and the new ambassador's personal popularity was most successful in strengthening the ties thus formed between England and France. On the outbreak of war in 1914 Sir Francis Bertie's position became one of great importance and responsibility, and he was unifying in his efforts towards establishing the most complete understanding between England and France. He retired in 1918. Bertie had been made K.C.B. in 1902, G.C.V.O. and privy councillor in 1903, G.C.M.G. in 1904, and G.C.B. in 1908. He was raised to the peerage on his retirement with the title of Viscount Bertie of Thame. He died in London Sept. 27, 1919 and was succeeded by his son, Vere Frederick Bertie (b. 1878).

BERTOLINI, Pietro (1853–1920), Italian statesman, was born at Monza, June 16, 1853. He began his career as a barrister and student of economic and administrative questions, and entered parliament in 1881 as member for his native town. Two years later he became Under-Secretary for Finance in the Crispì Cabinet. He was afterwards Under-Secretary at the Ministry of the Interior in the Pelloux Cabinet (1898–1900), in which he was, so to speak, the representative of Baron Sonnino's party. On the fall of Gen. Pelloux he hoped to return to office in a future Sonnino ministry; but as the latter seemed ever less likely to become a reality, Bertolini lost patience and joined Sig. Giositti. His conduct in abandoning his old chief was much criticised at the time, but his new patron chose Pelloux as Minister of Public Works in the Cabinet of 1907. He proved a capable administrator, but his qualities were taxed to the utmost by the terrible earthquake at Messina and Reggio in 1908. When Giositti returned to power in 1911 he did not at first offer an appointment to Bertolini, but in the autumn of 1912 he entrusted him with the newly constituted Ministry of the Colonies. He failed, however, to show any exceptional qualifications for that position, and did little more than introduce some of the less desirable features of the Italian bureaucratic system into the new African possessions; the continued resistance of the Arabs in Libya was generally regarded as largely due to Bertolini's administrative errors. He was rapporteur for the extended sufrage bill, which first came into force with the general elections of 1913; the measure had been introduced to please the demagogic spirit which Giositti wished to conciliate, but Bertolini must be given credit for the ingeniousness of the machinery which he devised for enabling illiterates to vote and for avoiding electoral corruption as far as possible. On the outbreak of the World War Bertolini, as a faithful Giosittian, was an uncompromising neutralist, and came in for much obloquy in consequence. Throughout the war he remained in retirement, and failed to be reflected in 1919. Sig. Nitti appointed him senator and president of the Italian delegation on the Reparations Commission. He was the author of several valuable works on political and economic questions, notably a volume on local government in England. He died at Turin, Nov. 28, 1920.

Besant, Annie (1847–1933), English theosophist, was born in London Oct. 1, 1847, the daughter of William Page Wood. She married in 1867 the Rev. Frank Besant (d. 1917), afterwards vicar of Sibsey, Lines., but obtained a separation from her husband in 1873. She had become an ardent free-thinker, and shortly afterwards she was prosecuted and convicted, together with Charles Bradlaugh (see 4.372), for publishing "blasphemous" literature. From 1874 to 1888 she worked in close association with Bradlaugh both in politics and in free-thought propaganda, as a lecturer and a writer of pamphlets over the signature of "Ajak." Her increasing tendency towards socialism of the more revolutionary type occasioned a divergence between them after 1885, which was completed in 1889 by her adherence to the Theosophical Society. She became a devoted pupil of Mme. Blavatsky (see 4.48), founded schools at Benares, and was elected president of the Theosophical Society in 1907. In later years her activities again assumed a political cast. She founded the Indian Home Rule League and became its president in 1916, and in 1917 she was president of the Indian National Congress. In addition to her numerous free-thought pamphlets and a large number of later works on theosophy, she published her Autobiography in 1893, The Religious Problem in India (1902) and other books.

BESSELER, HANS VON (1852–1927), Prussian general and governor of Poland during the German occupation, was born April 27, 1850 at Gräfswald. He was one of those generals who, after having been placed upon the retired list, were recalled in 1914 to assume important commands. He conducted the siege of Antwerp, which he occupied on Oct. 9, 1914. In 1915 he was employed on the eastern front, and on Aug. 19 of that year took Novogeorgievsk. From Aug. 27, 1915 to Nov. 1918 he was German governor-general of Poland at Warsaw, in which capacity he endeavoured with diminishing success to organize a form of Polish national government and representation under German auspices as well as to form a Polish army under German control. The Armistice and the German Revolution put an end to the complicated attempts of Beseler and the Austrians to arrive at a modus vivendi with regard to Poland's political and territorial destiny. The revolutionary Soldiers' Councils asserted themselves, and the German governor-general with the German troops of occupation left the country.

BESNARD, Paul Albert (1849–1934), French painter, was born in Paris in 1849 and studied at the École des Beaux-Arts, winning the Prix de Rome in 1874. Until about 1880 he followed the academic tradition, but then broke away completely, and devoted himself to the study of colour and light as conceived by the impressionists. The naturalism of this group never appealed to his imagination, but he applied their technical method adapted to meet more complicated problems of light, such as a union of twilight and artificial light to ideological and decorative works on a large scale towards which his residence in Rome had strongly inclined him. Such are his decorations at the Sorbonne, the École de Pharmacie, the Salle des Sciences at the Hôtel de Ville, the mairie of the first arrondissement, the Théâtre Français, the Petit Palais, and the chapel of Bercy hospital, for which he painted twelve "Stations of the Cross." A large panel "Peace by Arbitration," was completed seven days before the outbreak of war in 1914. A great virtuoso, he has handled with equal facility water-colour, pastel, oil-painting and etching. Partly under the influence of Gainsborough and Reynolds, whom he studied during a three-years stay in England, he has applied his methods to a brilliant series of portraits, especially of women. Notable among these are the "Portrait
de Théâtre" (Mme. Réjane), and "Mme. Roger Jourdain." Recent work includes "Cardinal Mercier" (1917) and "The King and Queen of Belgium" (1919). His analysis and treatment of light is well seen in "La Femme qui se chausse" in the Luxembourg, Paris, one of a large group of nude studies of which a recent example is "Une Nympe au bord de la mer"; and in the work produced during and after a visit to India in 1911. His landscape work is represented by "L'ile heureuse," and "Un Ruisseau dans la Montagne" (1920). A symbolist in his decorative work, Besnard's frank delight in the external world and his "chic lourmeux technique bring him close to the 19th-century French School of the Salon. His participation in the Société Nationale des Beaux-Arts in 1890, in 1913 he became a member of the Institute and commander of the Legion of Honour. He has succeeded Carolus Duran as director of the French Academy in Rome.

See also C. Mauchir, Paul Albert Besnard (1914); G. Mourey, Albert Besnard (1916).

BETHAM-EDWARDS, MATILDA (1836—1910), British author, was born at Westerfield, Ipswich, March 4 1836. She studied French and German abroad and after some school-teaching in London, she settled down with her sister in Suffolk, to manage the farm which had belonged to her father. Not content, however, with purely rural occupations, she contributed from time to time to Household Words, having the advantage at this time of the friendship of Charles Dickens and an early association with Charles and Mary Lamb, friends of her mother. On her sister's death she moved to London and wrote a number of novels of French life based on her frequent visits to France and her intimate knowledge of provincial French homes. In this way she did much to promote a better understanding between the two peoples. Her chief books are: The White House by the Sea (1857); Anglo-French Reminiscences (1868); East of Paris (1903); Home Life in France and Promises in France (1907) and the posthumously published Mid-Victorian Memories (1910), which contains a personal sketch of its author by Sarah Grand. She died at Hastings Jan. 4 1910.

BETHMANN HOLLWE, THEOBALD VON (1856-1921), Chanceller, of the German Empire from July 1909 to July 1917, was born Nov. 29 1856 at Hohenfinow, the family property near Berlin, where he also died. He was descended from the Frankfurt banking family of Bethmann, which attained great prosperity in the 18th century, and a branch of which was founded by his great-grandfather, Johann Jakob Bethmann, who had married a daughter of the house. The Chancellor's grandfather was Moritz August von Bethmann Hollweg, a Bonn professor of law, who was a leading member of the Prussian Diet from 1849 to 1852 and was Minister of Education under the Prince-Regent (afterwards William I) from 1858 to 1862.

It was to the Liberal and West-German as well as to the commercial traditions of his family that Theobald von Bethmann Hollweg probably owed his appointment to the chancellorship in 1909 in a time of domestic and financial crisis. He had at the same time the qualification of a specifically Prussian career, having risen through the regular legal and military grades of promotion as Referendarius, Landrat, Government-President of Bromberg and Chief President of the province of Brandenburg. In 1895 he was appointed Prussian Minister of the Interior and in 1907 Secretary of State for the Imperial Home Office and Vice-president of the Prussian Ministry. At the time of Bethmann Hollweg's appointment to the chancellorship internal affairs, under his predecessor Prince Bülow, had reached a deadlock in the Reichstag owing to the revolt of a section of the Liberal-Conservative bloc against the proposal to establish death duties as part of the reform of the finances of the empire. The Catholic Centre, which had left the former parliamentary coalition before the dissolution of the Reichstag by Prince Bülow in 1907, was once more in alliance with the Conservatives, and the fiscal policy which these two parties had imposed upon the Government and the country had alienated the commercial classes and led to violent political conflicts. It was not until the general elections of 1912 had transformed the situation by bringing a great accession to the strength of the moderate National Liberals and the Left, especially the Social Democrats, that the Government was able to reckon upon a more amenable majority. In the interval Bethmann Hollweg endeavoured to conciliate the Catholic Centre by a policy of compromise in matters which had threatened to lead to a renewal of the Kulturkampf, such as the denunciation of the Reformation in the Papal Encyclical of 1910 and the Catholic demand for the modification of the Jusuit law. He secured the final abrogation of this law under stress of war conditions in April 1917. Bethmann Hollweg was likewise the sponsor of a constitutional amendment which in 1917 established the government of that territory of the empire upon the basis of popular representation in a territorial assembly and admission, though without full state rights, to the Federal Council. He was less successful with the vexed question of the Prussian franchise, which in 1910 he attempted to solve by proposing a direct system of election while retaining in a modified form the local division of the electorate according to income-tax assessment into three classes. His bill was ultimately rejected by the reactionary Chamber of Deputies. This question was again to occupy him with the stress of the war. Under the impression produced by the Russian Revolution of March 1917 he was constrained to inspire the "Easter message" of the Emperor as King of Prussia promising the abolition of the three-class system after the war, a proclamation which was followed in the same year by the edict of July 11 announcing that a bill would at once be introduced to enact equal direct and secret suffrage. This project of reform came too late to reconcile the revolutionary elements in the Prussian state. Bethmann Hollweg's political career ended immediately after the July edict, and, although a bill was introduced in the following Nov. by his successor, Count Hertling, the opposition of the Prussian Conservatives and other reactionary elements prevented it from passing before the revolution. He was equally unsuccessful in dealing with an outbreak of militarism in Nov. 1913 at Zahern in Alsace, where the population, exasperated by the truculence of a young officer, was subjected to the arbitrary exercise of martial law by the colonel in command of the garrison. Bethmann Hollweg's treatment of the incident satisfied neither the reactionaries nor the advanced parties, and, for the first time in the history of the Reichstag, a vote of censure was passed upon the Chancellor.
military party, in particular from the hostility of the creator of the German navy, Admiral von Tirpitz, who was once and again put forward by the more aggressive chauvinists as their candidate for the chancellorship. But Bethmann Hollweg himself did not view that the influence of that powerful section of German opinion and its action in military and naval as in foreign policy furnished ample justification for such measures of precaution as the Western Powers and Russia concurred, measures which, indeed, proved hardly adequate to confront the first German onset in 1914.

The renewed conflict with France over Morocco in 1911, the dispatch of the gunboat "Panther" to Agadir, the consequent friction with Great Britain and the prolonged negotiations which led to the mutually unsatisfactory Franco-German Morocco agreement, mainly fell on the shoulders of Bethmann Hollweg as his subordinate, Herr von Kiderlen-Waechter, who at that time was Secretary of State at the Foreign Office. Here, as on other occasions, the Chancellor was probably public in his intentions, but in the means which were adopted to secure Germany's objects he showed either lack of judgment or inability to control his political and military subordinates.

In his book Betrochtungen zum Weltkrieg (Reflections on the World War), written in his retirement at Hohenfinow after the collapse of Germany, he gives an account of the exchange of views which took place between him and Lord Haldane during the latter's visit to Berlin in February, 1912. This account ought to be read in conjunction with Lord Haldane's own report of his visit, particularly with regard to the attempt of the two statesmen to find a formula for a treaty of mutual assurance calculated to allay apprehensions of war between Great Britain and Germany. Bethmann Hollweg wished to obtain an engagement from Great Britain to observe a benevolent neutrality in the event of Germany's becoming "entangled in a war with one or more other Powers," or, as he finally formulated it, "if war should be forced upon Germany." His conception of a war "forced upon Germany" was subsequently revealed by his deliberate declarations of war upon Russia and France, acceding the one Power of having rendered war unavoidable by its precautionary measures of mobilization and the other of having opened hostilities by air raids which never took place. In the exchange of views regarding the German and British naval programmes Lord Haldane received the impression that Bethmann Hollweg was pursuing a different policy from that of Admiral Tirpitz, but that the latter had the support of a powerful and certainly active party in the country and was able to get his way. Indeed, Bethmann Hollweg himself says in his book that "when differences arose between the Admiralty and the civilian leadership public opinion was almost without exception on the side of the Admiralty." There were from time to time evidences of a similar lack of continuous agreement and coordination between the policy of the Chancellor and that of the Secretaries of State in other departments, while the views of the Emperor William II. himself were notoriously liable to sudden and inconstant change. In a marginal note on one of the diplomatic documents of July 1914, the Emperor contemptuously referred to Bethmann Hollweg as the "civilian Chancellor," as if policy were the business of the generals. Yet the Chancellor was in evident agreement with the Emperor's view that it was imperative for Austro-German action, to alter the balance of power in the Balkans and to put an end to the traditional and national Russian policy of protecting the small Slav nations. Germany's "expansion" in the Near East was similarly to be promoted and her supremacy at Constantinople established at the expense of Russia's interests in a sphere that was vital for the Russian Empire.

The interview between the British ambassador, Sir Edward Goschen, and the German Chancellor, at their parting immediately before the declaration of war in 1914, when the latter in the course of "a harangue which lasted for about 20 minutes" spoke of the international treaty guaranteeing Belgium's neutrality as a "scrap of paper" and asked whether the British Government had considered "at what price that compact would have been kept," furnishes the crowning evidence of Bethmann Hollweg's essentially Prussian conceptions of political morality.

"In the moment of anger the true man stood revealed: . . . To break a treaty pledging the national honour seems a singular thing to him, if to keep it involved sacrifice and danger . . . Herr von Bethmann Hollweg evidently thought that a slighted promise need not be kept, if the engagement involves momentous and unpleasant consequences. Not only does it throw the most unpleasant light upon his own notions of honour, but it makes the commentator ask whether it was possible to make any permanent settlement with a nation whose leading statesman obviously held the view that any treaty was only to be kept so long as it was profitable to the signatory parties."

The evidence that at the time when Germany broke the peace Bethmann Hollweg was in a state of extreme nervous tension, due probably as much to the sense of the moral quicksands on which Germany's case was based as to the collapse of all his calculations regarding the effect of his policy upon the other Great Powers. In the case of Great Britain his disillusionment was complete and confessed. In the case of Russia he had apparently hoped that a display of firmness would bring about the same public renunciation of Russian policy which Germany had been able to secure by the "bluff" of 1908-9 in connexion with the Austrian annexation of Bosnia and Herzegovina. The pro-Hungarian ambassador Count Szégyeny's report of his interview with William II. on July 5 is to the effect that in the event of action against Serbia the Emperor Francis Joseph could rely upon Germany's support and "he had not the slightest doubt that Bethmann Hollweg would entirely agree with this view . . . Russia's attitude would be hostile, but William II. had for years been prepared for this war, and, should it ever come to war between Austria and Russia, we could be convinced that Germany with her customary loyalty to the Alliance would stand at our side." In subsequent conversation with Bethmann Hollweg Count Szégyeny ascertained that the Imperial Chancellor, just like the Emperor William, regarded immediate action against Serbia as the most radical and best solution of our difficulties in the Balkans. From the international standpoint he considers the present moment more favourable than later and agrees that we shall inform neither Rumania nor Italy [both allies] beforehand of our eventual action."

Admiral von Tirpitz testifies that upon his mind the ultimate to Russia and the declaration of war produced the impression of being ill-considered and due to a want of management. Bethmann Hollweg was throughout those days so excited and irritable that it was impossible to converse with him. I can still hear him as with uplifted arms he repeatedly emphasized the absolute necessity of the declaration of war and put an end to all further discussion." He told Tirpitz that war must be declared because the Germans wished to send patrols across the frontier at once. Moltke, on the other hand, informed Tirpitz that there was no such intention and that "from his point of view a declaration of war was of no importance."

During the war period of Bethmann Hollweg's chancellorship (Aug. 1914-Jul. 1917) his public speeches were designed to create the impression of Germany's invincibility. He was accused by his political adversaries of having all the time entertained the secret hope of coming to a separate understanding with Great Britain and of having influenced military and naval policy through the Emperor with this object in view. In reality he never approximated to the elementary conditions of peace terms with the Allies, and in respect both of Belgium and France constantly referred to guarantees in the shape of an extension of power (Machtgrundlagen) which would be a necessary condition of a settlement. "History," he said, "knows no instance of the status quo ante after such tremendous events"

BEYERS—BIKANER

(speech of April 5 1916). On the question of unrestricted submarine warfare he ultimately divested himself of responsibility, having declared to the Emperor in Jan. 1917: "I can give Your Majesty neither my assent to the unrestricted U-boat warfare nor my refusal. I submit to Your Majesty's decision" 1 which was that of the General Staff and the Admiralty. He must have given his explicit assent to the monstrous note addressed on Jan. 19 1917 by his Secretary of State for Foreign Affairs, Zimmermann, to Mexico inviting her to attack the United States in the hope of annexing New Mexico, Texas and Arizona and to try to detach Japan from the Allied cause. His alleged high principles did not prevent him from associating himself with this scheme for a treacherous assault upon a Power with whom Germany was then at peace.

By the middle of July 1917 Bethmann Hollweg had lost all support in the Reichstag. The Conservatives and National Liberals were alienated by his Prussian franchise policy and his conflicts with the higher command. The Left and the Catholic Centre in which Erzberger with his so-called Peace Resolution (adopted by the Reichstag on July 15) had acquired the upper hand were convinced that the Allied and Associated Powers would place no confidence in the overtures of men with the past of Bethmann Hollweg and Zimmermann. Finally, on the morrow of the publication of the second Prussian Franchise Edict, on July 14 1917, Hindenburg and Ludendorff came to Berlin in order to hold conferences with the chiefs of political parties regarding the terms of the "Peace Resolution." The Chancellor could not tolerate this military interference with his own department, and the Emperor, confronted with an ultimatum from his two indispensable military leaders, accepted the Chancellor's resignation. Bethmann Hollweg retired to Hohenfinfo and took no further part in politics beyond writing his Reflections on the World War (vol. i. 1916). He died at Hohenfinfo on Jan. 1 1921, after a brief illness. (G. S.)

BEYERS, CHRISTIAN FREDERICK (1869-1914), S. African general, was born in Cape Colony in 1869 and went as a young man to the Transvaal, where he took a prominent part on the Boer side in the S. African War, winning high distinction in the field and bearing the rank of general when peace was made in 1902. Gen. Beyers had much influence, as soldier and statesman, among the Dutch-speaking people of S. Africa, and was, with Gen. Botha and Gen. Smuts, though in a less degree than they, one of the recognized leaders of the Transvaal Dutch. When responsible government was granted to the Transvaal, Beyers became speaker of the Lower House. He showed in the speaker's chair remarkable gifts. He was acute, tolerant and rigidly impartial, thus making a deep impression upon English-speaking S. Africans, who would have supported his claims to be the first speaker of the first S. African House of Assembly, had they been pressed by Gen. Botha, the first Prime Minister. Instead, Beyers was made commandant-general of the Citizen Forces of S.Africa, and in that capacity paid a visit to Great Britain, Germany, Switzerland and Holland in 1912. A man of fine physique, of passionate nature, and of profound religious convictions, Beyers, as commandant-general of S. Africa, was entertained with marked attentions during his visit to Germany by the Kaiser. When the World War broke out, he set himself in almost open opposition to the policy of the Botha Government. For some months this opposition smouldered. Then, at a moment when the S. African expeditionary force was being mobilized for the invasion of German S.W. Africa, and when rebellion was already smouldering in the Transvaal Dutch, Beyers resigned his post as commandant-general in a letter addressed to Gen. Smuts, then Minister of Defence, and published in Het Volk, an anti-Government journal. In this letter he declared that he had always disapproved the Government's intention to invade German S.W. Africa and that this disapproval was shared by the great majority of the Dutch-speaking people of the Union. Gen. Smuts replied in a stern letter declaring that the war was a test of the loyalty to their pledged word of the Dutch-speaking people, and accepting Beyers' resignation. A few weeks later Beyers took the field as a leader of the rebellion against the Government, only to be overwhelmed by the Government troops under the command of Gen. Botha, to be driven from pillar to post as a fugitive, and to be drowned on Dec. 7 1914 while trying to escape from his pursuers by crossing the Vaal river. His body was recovered two days later, and with his death the rebellion was brought to an ignominious end.

BHOWNAGREE, SIR MANCHERJEE MERWANJEE (1851- ), Indian parliamentarian, the son of a Parsee merchant of Bombay, was born in Bombay Aug. 15 1851, and began life as a journalist, but when only 22 was appointed, on the death of his father, to succeed to the Bombay agency of the Kathiawar state of Bhavanagar. Called to the bar at Lincoln's Inn in 1885, in the following year the Maharaja appointed him judicial councillor, a post in which he introduced far-reaching reforms. Settling in England in 1891, he actively associated himself with public bodies connected with India. He was the head of the Parsee organization in Europe and chairman of the Indian Social Club. To the Imperial Institute building he contributed, in memory of his only sister, the eastern colonnade leading to the Indian section. His compatriot Dadabhai Naoroji was in the 1892-5 parliament, but Bhownagree, elected in the latter year in the Unionist interest for N.E. Bethnal Green, was the only other Indian to enter the House of Commons, and the only one to be reelected (1900). During his ten years there he impressed the House by the vigour and eloquence of his speeches on Indian matters, and he originated and unflaggingly maintained in and out of the House the long battle against the disabilities of Indians in South Africa and other overseas dominions of the Crown. His cogent and detailed statement of the case for Indians in the Transvaal after annexation was the basis of a blue-book (Cd. 2239, 1904), and was sent to Lord Milner by the Colonial Secretary, Alfred Lyttelton, with the observation that he felt much sympathy for the views expressed, and that it would be difficult to give a fully satisfactory answer. The practical result was that the proposals of the High Commissioner were in some important particulars rejected. Bhownagree was one of the first Indians to press forward the need for technical and vocational education in India side by side with the literary instruction which was too exclusively maintained. He was made a C.I.E. in 1896 and K.C.I.E. in 1897. In early life he wrote a history of the constitution of the East India Company, and made a Gujarati translation of Queen Victoria's Life in the Highlands. During the World War he assisted in repelling German falsehoods regarding British rule in India by means of a widely circulated booklet entitled The Verdict of India.

BIGELOW, JOHN (1817-1911), American diplomat and journalist (see 3:22), died in New York Dec. 19 1911. In 1909 he published three volumes of Retrospections of an Active Life, covering his career to 1866. Two additional volumes, ending with 1879, were issued by his son (1913).

BIKANER, SIR GANGA SINGH, MAHARAJA OF (1880- ). Indian soldier and statesman, was born Oct. 3 1880, and succeeded by adoption his elder brother, Dungar Singh, in 1887 as 21st ruler of the state. After education at the Mayo College, Ajmere, he was invested with full powers in 1898, and promptly showed energy and skill in their use in combating the great famine of 1899-1900. In the Chinese campaign of 1901 he accompanied the British contingent in command of his famous Camel Corps, the Ganga Risala, which also did good service in Sowmand in 1903. The first of his many visits to England was made in 1902, when he attended King Edward's coronation, and was made a C.C. to the King. He continued to serve King George when he came to the throne. In the World War the Maharaja offered the whole resources of the state and served first on the headquarters staff of the Meerut division in France, and later on the staff of the British commander-in-chief. In 1915, at the head of his Camel Corps, he took part in the fighting to withstand the Turkish invasion of Egypt. In 1917 he and Sir S. P. (afterwards Lord) Sinha were the first Indians to be called to London for Empire gatherings. They were members of the Imperial War Confer-
BILHARZIOSIS—BIRDWOOD, SIR W. R.

ence and assisted the Secretary for India at the Imperial War Cabinet. The Maharaja’s public speeches attracted marked attention, and were collected under the title of India’s Imperial Part in Egypt. His warm sympathy with Indian aspirations of self-government within the Empire made the greater impression on public opinion because of the notable moral and material progressiveness and efficiency of his administration in Bikaner, and his constitutional reforms. He was selected to represent the Indian states at the Peace Conference and the Imperial Cabinet meetings in connexion therewith, and at Versailles on June 28 1919 he affixed the first Indian signature to a great international treaty. Keenly concerned to uphold the rights and dignities of the ruling princes, he formulated their views with force and skill. He was the dominant person in the influence securing the constitution, under royal proclamation, by the Chamber of Princes in 1912 as a deliberative, consultative and advisory body. His appointment as chancellor, carrying the presidency of the small standing committee, was indicative of the intellectual ascendancy he had acquired in the deliberations of the rulers. He had made himself well known as a sportsman, and in 1920 the “record” tigeress (9 ft. 7 in.) fell to his gun. A major-general of the British army, his honours included the grand crosses of the Victorian and the two Indian Orders, the knighthood of the Bath, the honorary doctorate in laws of Oxford, Cambridge and Edinburgh and the freedom of the cities of London, Edinburgh, Manchester and Bristol. His permanent local salutation was raised from 17 to 19 guns.

BILHARZIOSIS (see 3,032).—The complete elucidation of the cause, mode of transmission, prevention and cure of this disease (Schistosoma haematobium) was one of the triumphs of medical progress during the decade 1910-20. In 1913-4, in his annual report on Egypt, Lord Kitchener said: “It is a high time that some steps should be taken to prevent the continuity of infection which has been going on so long in this country.” At that time Egypt was a hot-bed of the disease, and so were many areas of South Africa. Indeed some 624 British soldiers were infected during the Boer War of 1899-1902, and of these in 1914 no fewer than 350 were still on the sick-list.

Early in the World War, when British troops were dispatched to Egypt, Sir Alfred Keogh, director-general of the A.M.S., sent a mission there to investigate bilharziosis. At the head of it was Lt.-Col. R. T. Leiper, helminthologist to the London School of Tropical Medicine. Leiper’s object was to discover the intermediate host of the parasite which is the cause of this disease. The parasite itself had already been discovered, as early as 1852, and was called after its discoverer T. Bilharz, a German. There was, moreover, no reason to suppose that a large portion of its life-history was passed in the body of a fresh-water mollusc, this being a usual cycle among trematode worms (see 27,240). Leiper adopted the simple measure of engaging a large number of native boys and paying them to collect all the molluscs they could find. The boys brought in large quantities, and the research workers set themselves to examine them. Within a very short period the parasite of bilharziosis was found in the body of one variety, a water-snail which inhabits canals and pools and is thus found at spots daily frequented, such as the praying ground at the embankment crossing in front of the cafes, and at the head of the canal daily used for washing.” The next step was to discover whether animals could be infected experimentally. Leiper observed that rats and mice and other vermin were notably scarce in the regions infested by the snails. A professional rat-catcher was employed but he failed to secure any animals. On June 13, 1915 the first positive result was obtained when a rat was experimentally infected. Various experiments were now undertaken to determine the mode of infection of human beings. It was found that both drinking and bathing are dangerous for the free-swimming parasites. “Cercariae” after they have been born from the body of the water-snail, are so provided that they are able to pierce the human skin and so enter the body. Happily they live only 36 hours after birth in the pools, dying thereafter unless they find a suitable host.

The life-history of the parasite is therefore a double one. It lives in the bodies of men from which it is passed to water where it enters the water-snail’s body. From this after six weeks it is hatched in the free-swimming form and then re-enters the bodies of men. The snail is safe until six weeks from its first infection have elapsed. It retains its powers of dissemination over considerable periods. The following conclusions were formulated:

1. Transient collections of water are quite safe after recent contamination.
2. All permanent collections of water such as the Nile canals, marshes and birkehs (pools) are potentially dangerous, depending on the presence of the essential intermediary host, the snail.
3. The removal of infected persons from a given area would have no effect, at least for some months, in reducing the liability to infection, as the intermediate hosts discharge infective agents for a prolonged period.
4. Infected troops cannot reinfest themselves or spread the disease directly to others. They could convey the disease to those parts of the world where a local mollusc could efficiently act as carrier.
5. Infection usually takes place both by the mouth and through the skin. Recently contaminated moist earth or water is not infective.
6. Infection in towns is acquired from unfiltered water, which is still supplied even in Cairo, in addition to filtered water, and is delivered by a separate system of pipes. (Sch. Stenostomum)
7. The eradication can be effected without the cooperation of infected individuals by destroying the molluscan intermediaries.

The irrigation work in Egypt being in the hands of the Government, it is possible to have the pools in which the snails breed drained and dealt with. Along such lines, at least, lie the preventive measures which will in course of time be instituted. Through Leiper’s work, therefore, this disease may be regarded as much less of a menace than it has ever been formerly.

The great success which attended this work caused other investigators to turn their attention to the disease and to begin the search for a cure. Many remedies had, of course, been tried, but none of these could be guaranteed to eliminate the parasites and so to render the system cured. Among others, Dr. J. B. Churchill, then in charge of research, suggested that in order to apply this disease the method of using antimony tetrathionate which had been employed with success in the treatment of the Indian disease kala-azar. This consists in giving the antimony by injection into a vein. Christopherson soon found that his idea was to be relied on and that the effect far exceeded his hopes. The parasites and their ova were killed off and the patients became entirely free of the disease. This work has now passed beyond the stage of experiment, and Christopherson’s treatment is universally acknowledged to be a complete cure of bilharziosis.

Thus this formidable disease has been conquered. Its means of transmission are known. Its prevention is only a matter of time. Its cure is a matter of certainty.

BINYON, LAURENCE (1865-, ), English poet (see 3,052), produced after 1910 a book on Botticelli (1913); a catalogue of Japanese woodcuts in the British Museum (1917); The Art of Asia (1915); English Poetry in Relation to Painting and other Arts (1918); For Dazzling France (1918) and Court Poets of the Great Mogul (1926); as well as certain collections of poems, Anuries (1913) and The Four Years (1919), the last of which was made together with others. From 1920 to 1925 he had previously appeared in several smaller collections. In 1920 his play Sakuna was performed in London.

BIRDWOOD, SIR GEORGE CHRISTOPHER MOLESWORTH (1832-1917), Anglo-Indian writer (see 3,979), died at Ealing June 28 1917.

BIRDWOOD, SIR WILLIAM RIDDELL, Bart. (1865- ), British general, was born Sept. 13 1865. He joined the 12th Lancers in 1883 and was in the following year transferred to the Indian staff corps, joining the cavalry. He served in the Hazara expedition of 1891 and the Hazara expedition of 1892, and in the 1907-8 frontier war. He was sent to South Africa in 1899 and served on the staff there during the whole of the war, the close of which found him a brevet lieutenant-colonel. He was afterwards closely associated for several years with Lord Kitchener in India, acting as his military secretary. In
1908 Birdwood, now a full colonel, held the position of chief staff-officer during the operations against the Mohmuns, for which he received the D.S.O., and he was a brigade-commander in India from 1909 to 1912. He had been promoted major-general in 1911; and in 1912, after holding for some months the position of quartermaster-general at Simla, he was appointed Secretary in the Army Department. Lord Kitchener in Dec. 1914 selected him for the command of the Australian forces in the Middle East, and in the following month he arrived in Egypt. After the retreat of April he commanded the army corps from the Antipodes which carried out the memorable landing at Anzac. He was in charge of the troops clinging to this patch of the Gallipoli Peninsula until Aug., and he then directed the unsuccessful offensive that was attempted from it. His personality had made him much liked and respected by the Australian troops. After the change that took place in the control of the Mediterranean field force in Oct., Birdwood (who had been awarded the K.C.M.G. and had been promoted lieutenant-general) assumed charge of the forces operating at the Dardanelles, and he carried out the very successful withdrawal of the troops from their dangerous positions in the following December and January. After a short period in Egypt he took his Australian troops to the western front, and he commanded them there for two years; he was given the K.C.B. and promoted general in 1917. On the reconstitution of the V. Army after the great German effort of the spring of 1918 had been checked, Sir William Birdwood was selected to lead it, and his troops bore an important part in the last phases of the British advance in the autumn. For his services he was made a baronet and a G.C.M.G., besides receiving a grant of £50,000. He paid a visit to the Antarctic later in the autumn, and received a great welcome; in 1920 he took up command of the northern army in India.

**BIRKENHEAD, FREDERICK EDWIN SMITH, 1ST VISCOUNT (1872— ), Lord Chancellor of Great Britain, the son of a barrister, was born at Birkenhead July 12 1872, and was educated at the local school, whence he proceeded with a classical scholarship to Wadham College, Oxford. He gained his first class in jurisprudence in 1893 and was Vinerian Law Scholar in 1896, was elected a Fellow of Merton and did a considerable amount of educational work in the next few years, being a lecturer both at Merton and at Oxford, and an extension lecturer in modern history both for Oxford and for Victoria University. But his attention was mainly directed to law and public life. He had been president of the Union at Oxford, and he entered at Gray’s Inn, being called to the bar in 1899. He went the northern circuit, and attached himself to the local bar at Liverpool, where he rapidly obtained a considerable practice. He also published a book on international law, which has gone through several editions. He soon took a prominent place among the Conservatives of Liverpool as a decided Tariff Reformer, and was returned for the Walton division in Jan. 1906, holding the seat till his elevation to the Chanceryship in 1919. When he entered the House of Commons, he found himself a member of a small and discouraged minority, who had been soundly beaten at the general election, mainly on the issues of tariff reform, Chinese labour in the Transvaal, and religious education. He himself, though he had achieved considerable local reputation, was practically unknown in London. Within a week of the opening of Parliament he bounded into fame by a sparkling maiden speech in a Tariff Reform debate—a speech conceived in a confident fighting spirit, calculated to cheer defeated partisans, and full of wit and epigram. One of his phrases went home—it was when he denounced tariff protection as “begotten by Chinese slavery out of Passive Resistance.” Mr. Lloyd George, who followed him in debate, spoke of the speech as very brilliant; and the Conservative party hailed him at once as a coming leader. He soon acquired a large practice at the bar in London, took silk in 1908, and became a bencher of his Inn. In Parliament, during the year of Opposition, he justified the expectations formed of him, but incurred the animosity of his opponents by the vehemence of his denunciation of ministerial schemes. He was chosen to move the rejection of the Parliament bill on the third reading in May 1911. In the crisis which followed he took an extreme view, was prominent in the disorderly proceedings when Mr. Asquith was refused a hearing in the House of Commons, and threw in his lot with the “Diehards.” At the coronation in that year his growing reputation in Parliament was recognized by his admission to the Privy Council; and in 1912 he appeared as an acknowledged leader of the party, moving the Opposition amendment to the Addison, and the rejection of the Welsh Disestablishment bill on second reading. He showed, moreover, as a Liverpool man, his strong sympathy with Ulster, threatened by the Home Rule bill; he went over to Ireland and constituted himself Sir Edward Carson’s principal lieutenant in the resistance which he was organizing in North-East Ulster against Home Rule.

When the World War broke out, he was one of the first Opposition leaders to place his services at the disposal of the Government. He accepted the position of head of the Press Bureau, and in that capacity encouraged, with a view to accelerate enlistment, the publication in The Times of Aug. 30 1914 of a telegram showing the serious plight of the British army after the retreat from Mons. But he went shortly afterwards to France on active service, with the Indian Corps, and was mentioned in despatches. He was captain in the King’s Own Oxfordshire Hussars, and a temporary lieutenant-colonel in the army. When the first Coalition Ministry was formed in May 1915, he was appointed Solicitor-General and knighted, and he succeeded Sir Edward Carson in November as Attorney-General, a post he held till 1919. The Defence of the Realm Act and other war-measures threw in these years a great burden of anxious work on the law officers of the Crown, including the prosecution of Sir Roger Casement for high treason at the Old Bailey. In the autumn of 1918 Sir Frederick Smith undertook a visit of propaganda to the United States, and published a book about it on his return. When Mr. Lloyd George reconstructed his Ministry after the general election of Dec. 1918, the Attorney-General was appointed Lord Chancellor and created a peer. The appointment, though quite in the normal course of promotion, was subjected to considerable criticism, owing partly to his comparative youth, but chiefly to his vehement partisanship in earlier years. But it was soon admitted (and notably by his colleagues on the judicial bench) to have been amply justified. Lord Birkenhead brought to the performance of his new duties the vigour which had always been characteristic of him; his judgments in the two final Courts of Appeal were weighty and lucid; and he quickly made himself a force in the Lords’ debates. His zeal for the efficient administration of justice caused him, in addition to his other heavy work, to sit during several weeks in the spring of 1921 as a judge of first instance, in order to clear off the enormous arrears in the Divorce Court. He was created a viscount on the King’s birthday in that year.

He married, in 1901, Margaret Eleanor, daughter of the Rev. Henry Furneaux, a well-known Oxford scholar, his family consisting of a son and two daughters. He was always a man of much physical activity, fond of a horse, of field sports and games, and of yachting.

**BIRMINGHAM, GEORGE A., pen-name of James Owen Hannay (1865—), Irish novelist and playwright, who was born July 16 1865 at Belfast. He was educated at Haileybury and Trinity College, Dublin, was ordained and became a canon of St. Patrick’s, Dublin, in 1912. He wrote amongst other novels: The Settling Pot (1903); Spanish Gold (1908); Last Towers (1914); The Red Hand of Ulster (1911); The Last Lovers (1913) and Inishkeen (1920), whilst among his plays the best known is General John Regan, which was successfully produced at the Apollo theatre, London, in Jan. 1913.

**BIRMINGHAM, England (see 3.08).—During 1910-21 the city of Birmingham greatly increased in size and importance. The primary cause of its growth in area was the extension of the municipal boundaries by a local Act of Parliament, though manufacturing enterprise and industrial developments before the World War, as well as the extraordinary influx of munition
BIRMINGHAM

workers in 1914–8, materially contributed to the increase in the population. For the purposes of the report of the medical officer of health published in 1920, the population was estimated to be 910,000. When the census was taken in 1911 the males over 18 years of age numbered 245,881 and the females 283,666. Judging from this ratio, at least 33,356 men of one year of age in the city had been reduced to 200,251, while the number of women residing in the city had increased during the war to 329,011. The war probably accounts largely for the falling-off in the birth-rate during the same period. In 1913 the rate was 27.3 per 1,000 and in 1918 the figure was 19.4. The intervening years show proportionate decreases. There were 19,335 babies born during 1919. This is equal to a birth-rate of 29.9 and indicates an upward tendency, though the increase of population is due more to the improvement in the death-rate than to the recovery of the birth statistics.

The Greater Birmingham scheme, the prospect of which in 1910 had greatly disturbed the authorities of the counties of Warwick, Worcestershire and Stafford, became an accomplished fact in 1911. Although the area taken into the city included a considerable amount of agricultural and undeveloped land in the county of Worcester, the residential suburbs annexed to the city in 1911 were mainly populated by people who derived their incomes, as well as their water, gas, electricity and other urban amenities, from the city.

The borough of Aston Manor, the urban districts of Erdington and Handsworth, almost all of the urban district of King's Norton, and the large district of Yardley were added to the city at this time. King's Norton and Northfield, as parts of Birmingham, ceased to be portions of Worcestershire from the geographical as well as from the administrative aspect, and came nominally within the new boundary of Warwickshire, as did Handsworth, from Staffordshire.

The area of the city was increased from 13,477 ac. to 43,337 ac., or about 86 sq. m., and the rateable value of Birmingham rose automatically from £2,965,711 to £4,340,017, leaving out of account the differential rate for various periods granted to certain of the added areas.

The membership of the city council was at the same time increased to 30 aldermen and 90 councillors, representing 30 wards. Judged by municipal standards, Birmingham was in 1921 the largest city in England.

Public Health.—In the decade immediately preceding the war the death-rate was 14.8 per 1,000, and for the five years from 1915 the figures declined from 14.4 to 13.0 in 1919. The death-rate was in 1921 the lowest but one among the large towns of Great Britain. One of the blessings of Birmingham's comprehensive cityward of health, and the decline in infantile mortality, is the employment by the health committee of a large and highly organized staff of lady health visitors. The city is divided into four quarters, each of which is under the supervision of an assistant medical officer of health or a lady doctor, the latter specializing in maternity and child-welfare work. The Corporation also employs specialists in tuberculosis, who have urban dispensaries and country sanatoria in their charge. The lady health visitors include 13 who have charge of tuberculosis cases, 19 who deal with the general health of certain congested areas, and 54 who are specially concerned with infant welfare, making a total of 86 lady health visitors.

Housing.—In Oct. 1910 the Corporation submitted a return to the Local Government Board showing that 14,000 new houses were at that time required to meet the unsatisfied demand, and that 50,000 might be required to release persons displaced by the clearance of insanitary areas, and to replace other dwellings which fell definitely below a reasonable standard. Prior to that date, however, the Corporation (July 1918) formulated a policy for dealing with the housing question and a number of proposals then suggested were incorporated in a local Act and in the Government's Housing Act of 1919. In the following winter the Corporation acquired by compulsory purchase 30 ac. of land on which 10,000 houses could be erected. Other large estates were subsequently purchased, and the Corporation was in 1921 in possession of about 1,930 ac. of land for housing purposes. This land would accommodate 30,000 new houses and be sufficient to meet the crisis of overcrowding, the average for the first four schemes being about £900 per house; the cost of the land and other expenses brought it up to £1,000. By the end of Jan. 1921, contracts were placed for 2,886 houses, which were to be built by direct labour. The Corporation also converted army huts at Castle Bromwich into dwellings for about 100 families.

Plan.—The Planning Committee of the town of England to prepare a comprehensive scheme of town planning. Important pioneer work in this direction was done by Mr. J. S. Nettleton when he was chairman of the Birmingham housing committee, before the passing of the Town Planning Act. He was in 1919 able to carry out this scheme were possible until the extension of the city in 1911, when 24,000 ac. of undeveloped land in the suburbs were brought under the control of the city council and Mr. Neville Chinnery became chairman of the town-planning committee. The first town-planning scheme authorized by the Local Government Board related to Harborne and Quinton, and dealt with 2,320 ac. of land. The wide side of main roads was defined, of some them being 100 ft. wide, and the owners of the adjoining land were notified that they would have to conform to a general layout affecting the construction and character of the side roads (which may be bow rounders and are expensive) and the number of houses and kind of buildings to be erected in the area. Open spaces and corner sites were reserved. No factories were provided for in this area, but considerable space was reserved for them in the E. Birmingham town-planning scheme. The larger part of the property is already industrial and the prevailing winds blow the smoke away from the city. These two schemes were approved in 1913. The N. Vardelsey scheme of 3,740 ac. and the S. Birminham scheme of 283 ac. were incorporated in the 1914-8 Act and approved in 1916. A supplementary scheme for S.W. Birmingham, involving an area of 9,866 ac., was launched after the war. The public works department had previously prepared tentative plans for improving the built-up area in the centre of the city, and widening the arterial roads. They have experimented with a sleeper tramway track between two carriage-ways, with wide grassed verges and numerous white-painted or red-painted trolley vehicles on a ring road and arterial roads, which are to be widened to 100 ft. or more. The first sections of road so widened were completed in 1915 at Edgbaston and Harborne. The scheme included not only the widening of arterial roads, the construction of 7, of new roads. During the trade slump of 1920–3 large numbers of unemployed were engaged in this work of road widening, and the construction of new roads was employed in laying out a municipal golf course in the park known as Woodley Woods and another course on land given by members of the Cadbury family on the Lecky hills. Another important addition to open spaces was the new park at Moseley Park (in 1923) given by Col. J. H. Wilkinson during the World War.

New Buildings.—The building of the municipal offices and art galleries on a portion of the Colmore estate, bounded by Ed- mund St., Congreve St., St. Charles St. and S. Margaret's St., which began in 1906, was completed in 1912. The offices of the gas, health, tramways and education departments were transferred from the old court-house to the new premises and the rooms thus vacated were utilized for the new department. The new public works department, town clerk's department, salvage department, parks department and the new municipal bank. In Oct. 1919 the new office of the town council was opened, and had been a generous donor to the museum and art gallery, was utilized for the erection of a handsome suite of picture galleries and a museum of casts over the new municipal offices and connected with the old art galleries. The new premises were opened on the 23rd of November. The museum and picture galleries were opened to the public on the 26th of November. The building of the new art gallery was carried out in 1912. The museum was established at the same time, and a unique collection of British birds with their nests and perfectly natural surroundings was provided as a memorial to the late Alderman C. G. Beale. The site of the new art gallery is devoted to the work of modern English painters and contains some of the larger pictures, such as Millais' "Widow's Mute," Lord Leighton's "Condottieri," Henry Moore's "Newhaven Packet," "Autumn" by Sir L. Adams, "The Village Philharmonic" by Stanhope Forbes, "Hayle from Lelant" by Sir Alfred East. Gallery II. contains old masters and portraits of local worthies, including excellent examples by Reynolds and Gainsborough. The new galleries and the site, with the exception of the E. buildings, were designed by Mr. E. C. Edge, but they are not the By the Ministry of Works, and the larger part of the buildings have been designed by Mr. E. C. Edge, but they are not the work of the English Pre-Raphaelites, notably those of Sir Edward Burne-Jones, a native of Birmingham. This collection, both in size and importance, is unrivalled. Another interesting gallery is No. VII, which contains drawings by T. Masson, an intimate friend of the Ruskin collection, and other important water-colours. A large collection of drawings by David Cox and other local artists is in gallery VIII. Next to the art gallery is the "New Street Station," which contains numerous works of art, and is devoted to decorative and industrial art, including the Feeney collection of nearly 2,000 pieces and several important collections on loan. One of the new galleries is reserved for loan exhibitions of pictures. In 1911 the Municipal Art Gallery was opened in a new building on the site of the old office, which was transferred to the new site. The figures for 1914–8 included the original buildings and the new gallery, but since 1918 they have been separately calculated. The figures for 1914–8 included the original buildings and the new gallery, but since 1918 they have been separately calculated. The figures for 1914–8 included the original buildings and the new gallery, but since 1918 they have been separately calculated.
of the Royal Society of Artists were rebuilt on modest lines, and the classic portico which was a striking architectural feature of New St. diminishes to a large extent. The name of which Queen's College remains an ornament to Paradise St., though it was used in 1921 mainly for commercial purposes instead of for theological training, owing to the exigencies of ecclesiastical finance. The Royal Parks are in Station St., with Victoria Park, the residence of Barry V. Jackson, founder of the Pilgrim Players, and the enthusiasm of John Drinkwater, the playwright.

Highbury, Moor Green, formerly the residence of Joseph Chamberlain, is the "Ouliffe," the home of the late Mr. Richard Cadbury, who were during the war converted into orthopaedic hospitals for disabled soldiers. When they ceased to be so used the Ministry of Pensions took over and reverted to the Corporation as gifts from Mr. Austen Chamberlain and Mr. Barrow Cadbury. "Sorrento," Wake Green Rd., Moseley, was acquired by the citizens' committee during the war for the treatment of civilian patients and pensioners. Presently the Wolverhampton Orthopaedic Centre for Disabled Soldiers is at Rednal, and one of the city asylums at Rubery was still occupied in 1921 by the Ministry of Pensions for orthopaedic cases. The old Children's Hospital in Broad St. was used for various Government purposes during the war, and larger premises were provided by voluntary contributions, with up-to-date equipment for the treatment of sick children, in Ladywood Road. A hospital for nervous diseases was established after the war at Edgbaston.

Libraries.—Several important additions have been made to the public libraries of the city. In addition to the central reference and lending libraries, which are in the vicinity of the new University buildings, the 1921 branch libraries and news-rooms, two branch reference libraries, a reading-room at Witton and a delivery station in the outlying district of Quinton, as well as a new commercial library in the new city hall. The reference library contains nearly 300,000 volumes, including the well-known Shakespeare Memorial Collection of 17,000 volumes, of which 3,000 were purchased in the 19th century. The Birmingham collection, of which a 1,140-page catalogue was published in 1918, a collection of poetry relating to the World War; the Sir Benjamin Stone collection of photographs; large Byron, Milton and Cervantes collections and a collection of manuscripts and other relics of Boulton and Watt.

The lending libraries contain nearly 250,000 volumes, the annual users numbering about 2,300,000. The lending libraries were in 1921 increased in number to 21 branches, with 149 reading-rooms. An innovation is the commercial library, containing about 3,000 volumes, the collection of trade catalogues and files of 220 periodicals, which was opened at the end of the war.

Municipal Bank.—The Municipal Bank, which was established mainly through the efforts of Mr. Neville Chamberlain when he was lord mayor, loaned £500,000 to the Government during the war, this amount being invested in small sums by 30,000 depositors, who were all employed persons. Owing to the opposition of the joint-stock banks through their parliamentary representatives in 1915, the operations of the bank were severely limited during the war, but its financial position improved. The bank is now able to extend its powers in 1919 and in that year over £500,000 was transferred from the war-time organization to a permanent municipal institution, the first of its kind in England.

The University.—A new chapter in the history of the university in Birmingham began with the visit of King Edward VII. and Queen Alexandra to open the new buildings at Edgbaston on July 7 1900. The site, given by Lord Calthorpe, the principal landlord of the district, comprises 40 ac., near the Bourn Brook and about 3 m. from the Mason College (in the centre of the city) where the faculties of art, medicine and the department of education are still carried on. The new buildings designed by Sir Aston Webb, mainly for the technical side of the university, cover a large semicircle and its diameter, with a central tower 325 ft. high, erected to commemorate the foundation of the university by its first chancellor, Mr. Joseph Chamberlain. The great hall and power station for the engineering and allied departments were lavishly equipped to meet the special needs of the district, but the financial stringency arising out of the war has prevented the erection of the other large buildings necessary to make the design symmetrical, and to complete the accommodation for the chairs contemplated when the scheme was launched. The faculties of sciences (pure and applied) and of commerce are now housed on the Edgbaston site.

In 1919 the Treasury grant was increased to £3,000,000; the city contributed £300,000 for buildings, and the total cost of the new buildings was £1,140,000. Public appeal for funds resulted in about £500,000 being raised for the purpose of reducing the debt on the university and to increase the efficiency of the existing departments, though the amount available for these purposes was reduced by the fact that about £147,000 of the above-mentioned total was ear-marked for special purposes. The building scheme for the library, and for other departments, including the building of the new University College of Commerce and of Agriculture, is in course of completion, and the new building of the University Commercial College for Liberal Arts and Sciences is nearing completion. These new endowments are attached to old professorships. For instance, Sir George Kenrick endowed the physics chair in memory of the late Prof. J. H. Poynting, who had occupied it ever since Mason College was opened in 1863, and in 1919 a grant of £20,000 was made by Sir William and Lady H. of Newnham to the Science School. Mr. Grant Robertson endowed the chair of orthopaedic medicine, the first endowed chair of its kind in the country, and Sir Robert Cecil succeeded the late Mr. Chamberlain as chancellor in 1918; Sir Albert Garwood was also a beneficiary. The volumes accessible to students number about 100,000. The teaching staff increased from 117 in 1910 to 216 in 1920, and the number of full-time students from 958 to 1,754 in the same period. It is a distinctive feature of Birmingham university and modern universities that it does not include in its membership part-time students, these being provided for at the Midland Institute and the Municipal Technical School. On the recommendation of a committee the University of Birmingham has been asked to help to the Workers' Educational Association, both through its governing body and through individual members of the teaching staff. The income of the university increased from £57,143 in 1919 to £131,982 in 1921, of which £57,143 was contributed from the Endowment Fund, the Government, and the women's hostel into a nurses' home during the war; and the subsequent linking-up of Birmingham with Bristol and the northern universities for matriculation and parliamentary questions. The library was opened to the public in 1921. The volumes accessible to students number about 100,000. The teaching staff increased from 117 in 1910 to 216 in 1920, and the number of full-time students from 958 to 1,754 in the same period. It is a distinctive feature of Birmingham university and modern universities that it does not include in its membership part-time students, these being provided for at the Midland Institute and the Municipal Technical School. The teaching staff increased from 117 in 1910 to 216 in 1920, and the number of full-time students from 958 to 1,754 in the same period.
War-time Activities.—During the first month of the World War three city battalions were raised by the Lord Mayor, and the recruits under the voluntary system overflowed into several other new battalions, which were drawn from various districts of Birmingham. Birmingham contributed to the fighting forces of the nation at least 148,000 men. Over 11,000 Birmingham men were killed, and the number of wounded is not now known. The monthly allowances distributed by the V.C. The amount of money received for the promotion of the war raised in four separate weeks of special War Loan campaigns was £26,368,879, exclusive of several millions invested by the Corporation, the banks, and the general public in order to enable individuals and trade unions through the banks and post-office.

Birmingham was the first city to put into operation a comprehensive food rationing scheme, and this scheme afterwards became the basis of the plan adopted by the Government for the whole country.

At the university buildings at Edgbaston, which were the headquarters of the 1st Southern General Hospital, 1,136 beds were provided in the new Infirmary hospital, and 660 additional beds were later added, without cost to the City, which was allowed to proceed with the scheme of the medical authorities. The completed hospital was opened on December 18, 1914, and was handed over to the Government on March 18, 1915. The buildings of the University and the School of Medicine were also provided until there was a total of 6,168 beds. In addition to the 6,140 wounded men treated at the university, 20,000 patients were received at the hospitals of the University at Moor Hall, 8,000 at the elementary schools at Stirchley and King's Heath, 5,000 at the Monyhull Colony belonging to the board of guardians and at A.D. and civilian hospitals 5,000, making a total of over 100,000 military and civilian patients. It may be of interest to note that the record of the 1st and 2nd Birmingham War Hospitals, which were established under an arrangement with the auxiliaries committee of the Corporation. At the Royal and Holywood Mental Hospitals 35 Battle Casualties were housed, and over 100 other cases were treated. The City of Birmingham is the only candidate in the country entitled to the Queen's Award for the development of suitable accommodation for the treatment of mental cases, and to the very successful way in which the City treated these cases, requiring special treatment, were nursed back to health.

The fact that Birmingham was one of the most important munition centres of the country and was known to be able to supply the Government when required, they naturally made efforts to bomb the city from the air. For some time they were unsuccessful, owing to the severe lighting restrictions enforced by the chief constable in conjunction with the Fire Brigade, which did not allow any unnecessary stirring of the inhabitants, and the loss of life in the Black Country on Jan. 31, 1916, passed over the city without doing any damage. In consequence of representations made to the Government by the Lord Mayor of Birmingham on the behalfe of the municipalities of the Midlands, effective means were taken to warn the inhabitants of impending air raids, and the anti-aircraft defences were also considerably improved before the next Zeppelin raid, which took place on Oct. 10, 1917. On this occasion the effects were mainly confined to Austin Bridge, near the city boundary, but little damage was done. The third and final air attack on Birmingham took place on April 12, 1918, when five Zeppelins set out to bomb the industrial towns of the Midlands. Loo made direct for Birmingham, but timely warning was received at the headquarters of the Birmingham anti-aircraft defence in Newhall St., and when the airship was passing over Hockley Heath, just outside the city boundary, at an altitude of about 500 feet, 1,560 shells were opened, the first barrage being opened with a rapid fire of smoke fluid against the anti-aircraft guns. When the second and third Birmingham guns came into action the enemy turned tail, dropped two bombs, the first on the Robin Hood golf course and the other near Manor Farm, off Bearwood Road, the latter being burst and sent up a rapid fire of flames. The raiders dived low, dropped a bomb on the Turnpike Road, near Lapworth, and then took refuge in an empty building.

In addition to the thousands of Birmingham women who worked on munitions, 15,000 migrated into the city during the war. The local War agricultural committee, under the chairmanship of the volunteer reserve and the various naval and military auxiliaries also found employment for hundreds of girls. Among the many voluntary organizations in which ladies played a leading part, special mention should be made of the lady mayor's depot, from which 273,533 garments and other articles were sent to soldiers at the front and in hospital, and 136,162 parcels were sent to 1,531 prisoners of war, the depot being the regimental care committee for the French and Belgian regiments. A special hospital was opened for the wounded German prisoners, and was later superseded by a depot. The depot's work was carried on with a large amount of energy, and the ladies made a great success of it.

The work of the local War agricultural committee was appreciated by the War department, which, in May 1917, appointed a special committee of the War Agricultural Society of the United States to assist in the development of the local War agricultural committee. The local committee in its turn appointed a sub-committee of farmers' organizations, and the latter organization being responsible for a remarkable network of agencies for the relief of all kinds of civilian distress arising from the war, and for meeting the needs of soldiers' families and men brought to the City in their thousands.

BIRRELL AUGUSTINE (1850–1919), English author and politician (see 1905), continued to be Chief Secretary for Ireland till the Dublin rebellion of Easter 1916, over nine years in all—a tenure of exceptional length of this particular office. The cattle-driving agitation died down, and Irish politics, save for labour troubles, were comparatively quiet, till the two general elections of 1910 had once again made retention of office by the leaders of the Liberal party dependent on the Irish vote. A third Home Rule bill was now inevitable, and Mr. Birrell spent much of the autumn of 1911 in preparation for it, being cheered by the appreciation of him shown by his young Scottish fellow-countrymen in his election to the Lord Rectorship of Glasgow. The main conduct of the bill was, however, taken out of his hands in the sessions of 1912, 1913, and 1914 by Mr. Asquith, the Prime Minister; but he frequently wound up the debates, and was largely responsible for the treatment of details in committee.

When resistance was organized in Ulster, when volunteers were enlisted and drilled in the province, and a provisional government constituted, he adopted the inter-frae attitude which had throughout been the mark of his Irish administration, and he applied the same treatment to the Irish volunteers who were raised in reply in the Sinn Fein and Nationalist interest. In all the earlier discussions in Parliament, he made light of the Ulster difficulty, and was frequently betrayed into inappropriate flippancy. Talking of Ulster and religious bigotry, he said that he had his own views of ecclesiastics; he had been in close touch with cardinals and archbishops, and "commended them all to God." But towards the end of the debates, he adopted a more tolerant manner, and advocated a national solution, and settlement by consent. In a striking phrase in the debate on the address in 1914, he spoke of a new Ireland, not necessarily Home Rule or Nationalist, but "the renaissance of a nation."

When the World War broke out the controversy about Ulster was stilled as Home Rule was in abeyance, and in the Coalition Government of 1915 Mr. Birrell had Sir Edward Carson as a colleague, and would have had Mr. Redmond also. Mr. Redmond consented to accept Mr. Asquith's invitation. The danger with which he had to cope now came not from Orange men or constitutional Nationalists, but from extremists of the Sinn Fein, Irish-American and Irish Labour parties, of whom Casement and Larkin were the apparent leaders. They promoted a strong and largely successful propaganda against enlistment in Ireland, which he entirely failed to extinguish, and which culminated suddenly in open rebellion at Easter 1916 (see Ireland, History). Immediately after the suppression of the rising Mr. Birrell resigned, rather plaintively explaining that he was aware that he had done grave and considerable risks in not tackling Sinn Fein, but that he had subordinated everything in order to maintain unbroken the front of Ireland towards the enemies of the Empire. His retirement from office was followed by retirement from Parliament in 1918. He resumed his literary work, and published in 1920 a life of his father-in-law, the poet Frederick Locker-Lampson. His wife died in 1915.
acting as a kind of intermediary between the Cabinet and the army. After the Armistice he resigned (Dec. 1918) owing to disagreements with Sig. Orlando's Government over the Pact of London. He was opposed to the annexation by Italy of the Alto Adige because of its German population, and of North Dalmatia with its Slav majority; but he advocated the annexation of Fiume as a purely Italian town. His attitude on the Alto Adige and Dalmatian questions lost him the popularity he had hitherto enjoyed with the majority of the nation, and his speech at Milan on the League of Nations, in which he set forth these views, was unfavourably received. He came in for severe criticism for having, at a moment when Italy's representatives found their country's aspirations challenged at every turn by the Allies, to some extent given away the Italian case and provided opponents with arguments from the mouth of an Italian minister. At the same time everyone recognized his sterling qualities of honesty and genuine patriotism; however many people might disagree with his views, there was no doubt that he was inspired solely by what he believed were his country's best interests and noblest traditions, and his death at Rome on May 6, 1920 was deeply regretted by all, regardless of party divisions.

BITTER, KARL THEODORE FRANCIS (1867–1915), American sculptor (see 4.13), died in New York April 10, 1915. In 1911 he finished a model designed for the Henry Hudson monument. He was director of sculpture at the San Francisco Exposition (1912–5), and at the time of his death was president of the National Sculpture Society.

BJERKNES, VILHEM (1852–1910), Norwegian physicist, son of Carl Anton Bjerknes, professor of mathematics in the university of Christiania (see 4.19), was born in 1852, and was educated at the university of Christiania. He became at a very early age assistant to, and collaborator with, his father, who had discovered by mathematical analysis the remarkable apparent actions at a distance between pulsating and oscillating bodies in a fluid, and their analogy with the electric and magnetic actions at a distance. Apparently no attempt had been made to demonstrate experimentally the theories arrived at by the older professor until his son, then a lad of about 17 or 18 years of age, turned his mathematical knowledge and remarkable mechanical genius to the devising of a series of instruments, by which all the well-known phenomena of electricity and magnetism were illustrated and reproduced, by spheres and discs and membranes, set into rhythmic vibration in a bath containing a viscous fluid such as syrup. These remarkable demonstrations formed the most important exhibit in the department of physics at the Exposition Internationale d'Électricité held in Paris in 1881, and aroused the greatest interest in the scientific world.

The younger Bjerknes studied electric waves (1890–1) in Bonn, Germany, in the laboratory of Hertz, where he succeeded in giving the explanation of the phenomenon called "multiple resonance," discovered by Sarasin and De la Rive. Continuing his experiments at the university of Christiania (1891–2), he proved experimentally the influence which the conductivity and the magnetic properties of the metallic conductors exert upon the electric oscillations, and measured the depth to which the electric oscillations penetrate in metals of different conductivity and magnetic permeability (the "skin effect"). Finally he furnished (1895) a complete theory of the phenomenon of electric resonance, involving a method of utilizing resonance experiments for the determination of the wave lengths, and especially of the damping (the logarithmic decrement) of the oscillations in the transmitter and the receiver of the electric oscillations. These methods from that time have been in continuous use, and are now of great importance in the control of wireless telegraphy. His papers on electric oscillations were published in Annalen der Physik (1891–5). In 1895, after he had been appointed to the newly created professorship of mechanics and mathematical physics at the university of Stockholm, where he had been lecturer since 1893, he returned to hydrodynamic investigations, pursuing them in two different directions. In his Vorlesungen über Hydrodynamische Fernkrafte nach C. A. Bjerknes Theorie (1900–2) he gave the first complete mathematical and experimental exposition of the discoveries of his father, whose age and excessive self-criticism had prevented him from finishing his work himself; and in a later book, Die Kraftfelder (1909), he stated the same theory in a very much generalized form according to methods of his own. On the other hand, he developed in 1898 the general law for the formation of circulations and vortexes in a frictionless fluid, and began to apply the general vortex theory to atmospheric and oceanic motions. This attack upon the meteorologist's problems from a hydrodynamical point of view was after 1906 supported by the Carnegie Institution of Washington, of which he became a Research Associate. Two introductory volumes, Statics and Kinematics, of a greater work, Dynamic Meteorology and Hydrography, were published in 1913 under the auspices of the Institution.

In 1907 he was called back to the university of Christiania, where a personal professorship of mechanics and mathematical physics was created for him. In 1912 he was called to the university of Leipzig to create there a new professorship of geophysics and to organize, according to his own plans, a Geophysical Institute for atmospheric investigations. There, in 1916, he started the publication Synoptische Darstellung atmosphärischer Zustände über Europa; but in 1917 he returned to Norway, where he was attached, as professor of geophysics, to the new Geophysical Institute in the city of Bergen. He was the originator there of an improved and more scientific weather service, afterwards controlled by his son and collaborator, Jakob Bjerknes (b. 1897), which occasioned a new view of cyclones and anticyclones as waves in a surface of discontinuity separating air of polar from that of more equatorial origin, and cutting the ground along a line which can be followed on the weather maps, now generally called "the polar front." In 1893 Bjerknes married Honoría Bonnevie, who in earlier years assisted him much in his scientific work.

BLACHE, VIDAL DE LA (1845–1918), French geographer, was born at Pézenas, Hérault, Jan. 22, 1845. He was educated at the École Normale Supérieure in Paris, and entered upon the study of geography by way of that of history. The relations between geographical causes and historical effects were with him the subject of a life-study, the results of which are seen in one of his best-known works, the Tableau Général de l'Histoire et de la Géographie de la France, first published in 1849; and later republished separately; but he always refrained from pressing the theory of geographical "control" to an extreme. He joined the French school at Athens in 1867, and was thus enabled to travel extensively in Mediterranean lands. From 1872 to 1877 he was in charge, latterly as professor, of the department of history and geography at Nancy; from 1877 to 1898 he taught geography in the higher grades at the École Normale Supérieure, and from 1898 to 1908 he held the chair of geography in the Faculté des Lettres at Paris. He lectured widely, and among his publications is the monumental Atlas Général: Histoire et Géographie, first published in 1894; he founded in 1891 and edited until his death the periodical Annales de Géographie, and contributed constantly to its pages. He died at Tamaris-sur-mer (Var) on April 5, 1918.

BLAKE, EDWARD (1833–1912), Irish-Canadian statesman (see 4.35), died at Toronto March 1, 1912.

BLAKEYLOCK, RALPH ALBERT (1847–1919), American painter (see 4.38) died near Elizabethtown, N. Y., in the Adirondacks, Aug. 9, 1910. Because of insanity he was kept under restraint during the last 18 years of his life. In 1913 he was made an associate of the National Academy of Design and in 1915 a full member. In full the Toledo Art Museum paid $20,000 for his "Brook by Moonlight."

BLINDNESS (see 4.39).—In England legislators have been slow to recognize the claims of the blind. It is true that as far back as the reign of Elizabeth and onwards through the reigns of George III., William IV. and Victoria provision was made by way of maintenance or education, mostly through the Poor Law authorities, but this was totally inadequate. In 1859 the Report
of the Royal Commission on the Blind, the Deaf and the Dumb was published, and it would appear that the Elementary Education (Blind and Deaf Children) Act, 1893, was passed as a result. The Act made compulsory the education of blind children between the ages of 5 and 16, the responsibility falling upon the local Education authority for the district in which a child resides. The Education of Blind and Deaf-Mute Children (Scotland) Act was passed three years prior to the English Act. Powers in respect of the continuation of the education of the blind over the age of 16 are conferred upon Education authorities under that education Act, 1906, Part II, and the Education (England) Act, 1918. The Post Office Act, 1908, provides that a warrant may be given for attaching special postal rates for embossed literature. Regulations making *ophthalmia neonatorum* notifiable came into force in 1914.

In May 1914 Mr. (later Sir) Herbert Samuel, as president of the Local Government Board, appointed a "Departmental Committee on the Welfare of the Blind" to consider the condition of the blind in the United Kingdom and the means available for (a) their industrial or professional training, and (b) their assistance, and to make recommendations. This committee's report was issued in July 1917. As a result a special department dealing with the welfare of the blind was set up in the Ministry of Health, and an advisory committee appointed.

In 1920 the Blind Persons Act came into operation in the British Isles. It secures to blind persons in indifferent circumstances, on attaining the age of 50, "old-age" pensions of 10s. per week; it places the responsibility for the general care of the blind upon county and county borough councils and makes the registration of all charities for the blind compulsory. In Sept. 1920, the Ministry of Health appointed a committee to investigate and report on the causes of blindness, including defective vision sufficient to impair economic efficiency, and to suggest measures which might be taken for the prevention of blindness.

In the United States statutory provision for the blind may be divided into four divisions:

1. Laws affecting the education of the blind.
2. The action to be taken by the State in the creation of special provisions to be concerned in their general welfare.
3. Various forms of relief.
4. All other relations of the law to the blind, most of these being of an indirect character.

In most civilized countries State provision for the blind exists in a more or less adequate degree.

**Statistics.**—Dr. Harry Best has estimated that the blind population of the United States was 2,350,000 persons, exclusive of those blind as a result of war or of military service. It gives the following ratios per million of the population, as far as ascertainable:—Canada 449, Mexico 782, Argentina 892, Chile 860, Austria 694, Belgium 435, Denmark 1,175, Germany 609, Hungary 936, Ireland 982, Italy 1,175, Netherlands 463, Norway 926, Russia (European) 2,016, Sweden 664, Switzerland 722, India 1,416, Egypt 13,251, Australia 795, New Zealand 478.

The blind pop. of England and Wales, as given by the Ministry of Health, July 1920, was 30,785, or 835 per million of the population.

**Education.**—The education of very young blind children has lately received closer attention in England by the establishment of kindergarten schools and classes—nearly a model school at Birmingham, and the provision by the National Institute for the Blind of the first home in the British Empire for blind babies at Chorley Wood, Herts. This is followed by similar homes elsewhere. It is a fact that very few parents of blind children know how to treat them. Either they are spoiled by mistaken kindness or they are greatly neglected; in either case the result is thoroughly bad—hence the necessity of the teachers in these establishments, who may live under the best conditions and may, in the hands of experts, receive a training suited to their disability. The percentage of blind children under the age of five who are mentally defective is very high, ranging from 33.3% to 41.7% for submitting their qualifications to the scrutiny of an accredited examining body. The status qualifications, training, remuneration and recruitment of craft teachers of the blind receive the careful attention of the college, the question of training being the most important. Great difficulty is experienced in securing good craftsmen who are well educated and apt at imparting their knowledge to their pupils. Until better facilities are available it is suggested that the ranks may best be filled by making careful selection from among those who have lost their sight in adult life, professional and handicraft training to fit them even up to the age of 50, after which it is rarely successful. It is generally agreed that, where practicable, blind persons should look after the training of the blind to be occupied in their own sight, but where, as is usually the case, this is not feasible a selection from the occupations most suited to the blind has to be made. The following is a list of trades and occupations practised by the blind, either officially authorized or by the blind themselves. Suitable trade for either: brush-making, basket-making, mat-making, mattress-making and allied industries, cane and rush seating, boot-repairing, paper-making, carpentry and wooden-toy making, ships' fender making, netting up, kite making, soap-making, weaving, poultry-farming, dairy work, pig-rearing, gardening, fruit-farming, news-vending, shop-keeping.

Excluding professional careers it is generally agreed that the workshop provides the means of employing the blind, as there are a number of occupations of semi-professional or supervisory character in which they are suitable. In many cases receive a substantially weekly bonus by the operation of wages. Among the large workshops in the United Kingdom the following may be mentioned:—Bradford Royal Institution for the Blind; South West Marine School and Training Institute, South Wales; Institute of Blind Children of England; Special Educational School and Workshops for the Blind; Cardiff Institute for the Blind; Leeds Incorporated Institution for the Blind and the Deaf and Dumb; Henshaw's Institution for the Blind, Manchester; Royal Blind Institution for the Blind; Home Teaching and Vocational Training for Blind; Special residential Schools and Workshops and Home Teaching Society for the Outdoor Blind; Royal Blind Asylum and School, Edinburgh; Royal Glasgow Asylum for the Blind; Incorporated Association for Promoting the Welfare of the Blind, Torcetal Chambers, Col. Rd., London E.2, Railway Station Goods, 12th Floor; London School for the Blind.

**Systems of Reading.**—The Braille system is used throughout the world, and can be adapted to any language or dialect. English-speaking countries use the British alphabet based on the original French alphabet devised by Louis Braille. In the United States some differences were introduced, but at the time of writing it seems most probable that a system almost identical with that common to all other English-speaking countries will rapidly come into prominence.

In addition to the Braille method of producing books for the blind the system invented by the late Dr. Moon is used to a considerable extent. It is easier to learn than Braille, but has the serious disadvantage of being rather unpractical for teaching and writing.

**Embroided Literature.**—Great progress has been made in the methods of printing and illustrating books for the blind. In 1909 the National Institute for the Blind (then known as the British and Foreign Blind Association), through its secretary-general, Henry Stainsby, instituted exhaustive inquiries as to the best and quickest methods of printing Braille, with the result that the slow, cumbersome and unsatisfactory method of printing on wet paper gave place to the introduction of dry printing on special paper by means of fast-running electrically-driven and electrically-heated presses of the platen type. This new method of printing was found to be 15 times faster than the old method.

The Braille method is essentially diagrammatic rather than pictorial are printed on the same presses, the plates consisting of folded sheets of zinc upon which illustrations are embossed by means of steel engraving...
BILDNESS

463

The Braille music notation has recently undergone great developments at the hands of a committee of blind experts appointed by the National Institute for the Blind, under the chairmanship of Sir Francis Joseph Campbell, LL.D. The old method of writing several bars for the right hand followed by one bar corresponding for the left hand has given place to the practice of writing only a bar for each hand alternately. In music of a simple character both hands are marked by notes and the two modes are known as the "bar by bar" and "vertical score" methods respectively, and emphasize the harmonic aspect as distinguished from the melodic which characterized the old method, the parts being thus simplified for the treatment of small hands. So great has been the general improvement in representing the staff notation that it is now possible to record in Braille any kind of music, no matter how elaborate.

Lending Libraries.—Embossed books and music, being very cumbersome, can only be stored in limited numbers in the homes of the blind, but are admirably distributed free of charge by such agencies as the National Library for the Blind, London, which possesses 65,000 volumes (representing 7,500 complete works) of general literature in the Braille and Moon types, and 11,000 pieces of music (representing 5,000 complete works).

The methods of distribution have been devised to supply the blind with reading-matter other than through the ordinary channels of embossed books, but none of these have so far proved very practical through house-to-house canvass. This kind of investigation will solve many of the difficulties that now prevent their widespread adoption.

Institutions and Societies for the Blind.—The accommodation provided by these establishments has greatly improved in England either by additions to existing buildings or by the erection of entirely new premises. Within the latter category may be mentioned the schools for the blind at Gorleston-on-Sea, Leatherhead, Bristol, Bradford, and the workshops at Birmingham and Hull. The extensive new buildings of the headquarters of the National Institute for the Blind were opened by the King and Queen in March 1914. The institute has, since then, made enormous strides, its principal work being the education of blind children and music, home nursing, provision of homes and hostels for the blind, care of blind babies, the relief and after-care of blind civilians, and the higher education of blind students. While the institute is affiliated to St. Dunstan's and to the Canadian National Institute for the Blind, the last-named doing corresponding work from its headquarters in Toronto.

Old but notable blind men who have died since 1910 may be mentioned the following:—

Sir Francis Joseph Campbell, LL.D. (1832-1914), the writer of the earlier article in this encyclopedia (see 459). Born in Franklin county, Ohio—where he was educated at the age of 16 by the help of an acacia tree while playing. Educated at various schools for the blind, also at Harvard, Leipzig and Berlin. Was first principal and co-founder of the Institute of the Royal Normal College for the Blind, Upper Norwood, London. In 1891 the university of London gave him the degree of doctor of philosophy and of literature. He was given to the higher education of the blind, particularly in fitting sightless persons to become teachers, musicians, pianoforte-tuners, and industrial workers.

The Rev. H. J. R. Marston, M.A. (1853-1921). Rector of Lydford-on-Fosse. Graduate at Durham University, where he had a brilliant career, obtaining high honours and the Hellenistic Greek prize, also a fellowship.

John Brown Herrerosch (1841-1915). The famous blind designer of the "Vigilant," "Defender" and "Columbia," which so successfully defended the American Cup against the " Valkyries" of Lord Dunraven and Sir Thomas Lipton's " Shamrock," also a fellow of the Royal Nautical Institute.

The Rev. William Hill-Murray (1841-1911). As an agent of the National Blind Society of Scotland he was sent to China and there he borrowed the principle of the blind, and himself invented a numerical system for the blind to take the place of the intricate Chinese language.

BIBLIOGRAPHY.—Sir Arthur Pearson, Victory over Blindness (1910) and The Story of Blindness (1911); W. J. H. Hill, "The Principles and History of the Education of the Blind" (1910); Winifred Holt, A Beacon for the Blind, being the Life of Henry Faseett (1915); Harry Best, The Blind (1919); Win. Campbell Posey, Hygiene of the Eye (1920).

Blinded Soldiers and Sailors.—Special reference must be made to the donations of blind soldiers and sailors who were blinded in the World War, and who were organized to form the branch of St. Dunstan's, its organization, which it was the writer's privilege to found and conduct. These men form an exceptional group in the blind world, but the success of the ideas adopted in their training, the high example of the men themselves, and the interest awakened by their triumphs over difficulties, must have a permanent influence in raising the status of the blind even in other countries beyond the United Kingdom. The men were exceptional, because so many of them were young and full of the vigour of life, and it seemed as if even were they lost one of their senses the time taken from them. Drawn from all classes, differing greatly in education, experience and temperament, they were as a whole men with a keen hold on life, ready for any effort that would bring them again in touch with the everyday world of work and pleasure. Fundamental to their training was the idea that blindness was not to be regarded as setting men apart from their fellows. It was to be held in the light of a handicap; never as an affliction calling for pity. They were to rely on themselves to the utmost degree and to make it their object to be normal. In itself such a mental outlook had a far-reaching influence; it was based the whole system of training (representing men blinded since the first, found themselves kept in touch with all ordinary interests, were to be patronesses of the hostel. Other houses in the neighborhoods were lent or rented; temporary buildings—including dormitories, classrooms, workshops, two chapels and recreation halls—were erected in the grounds of St. Dunstan's. On account of the difficulty of getting in touch with the blinded soldiers scattered in many hospitals the military authorities arranged for their treatment at St. Mark's, Chelsea, the 2nd London General Hospital. In this way was avoided the danger of discharged men to be taken up by their homes with no other prospect than lives of vacuity. While they were at the Institute they all learnt what blind men are able to accomplish, and began to be interested in the work and success of the new hostels as well as to be patrons of the hostel. The task that lay before them of conquering blindness, a task in which the whole number were to fail. Nor was it to occupy any great length of time. The course of instruction, all that is involved in learning to be blind, occupied in some cases less than a year and seldom extended to two years. Many of the men were not only blind but had been otherwise wounded; some had lost a hand, or an arm or a leg, or were sufferers from shell-shock. But it was the result of these additional difficulties rapid progress was usually made.

The accepted definition of blindness was: "Unable to read or write or to do ordinary work in any ordinary way." The vast majority of the men who came to St. Dunstan's had their eyes destroyed or were what is known as "dark blind." The remainder were able to distinguish light, and of these a small number had some slight degree of sight. Such were the men who with almost unexampled fortitude set themselves to get back to active life.

It is well to emphasize the spirit of St. Dunstan's. The hostel was a place of bright spirit and great hope. The men were to be happy than the people about them were to help them to forget that they could not do and to make the most of all that they could do. In the great number of blind men and women giving the work, who therein sat as part of their time to the care, entertainment and instruction of the blinded soldiers. Through the entries in the public rooms of St. Dunstan's ran fine lines paths for the blinded men, tandems bordered the walks through the grounds, sounding boards gave warning of steps. With these helps the men quickly developed the sense of direction and obstacle, the confidence that would enable them to find their way in their own homes without assistance and to trust themselves in the world. The most difficult thing was the constant aim; the blinded soldier learned the value of avoiding whatever might emphasize his handicap. The more normal his bearing the more were these about him put at their ease, and from every point of view he was a happier man. His happiness was more apparent from the hearing and of smell he daily discovered new powers. From the impressions thus received he began to visualize, forming mental pictures of the people he met and his surroundings. The men at St. Dunstan's had not only to learn to work but to discover how

*These figures indicate the volume and page number of the previous article.
fully their leisure hours might be occupied. Constant entertain-
ments were given at the hostel; the men were taken to concerts and the-
theatres; they attended football and cricket matches, with escorts to
discourage the spectators who found much of the social life in driving
themselves into the interest of outdoors sports, swimming, foot
races, tug-of-war and rowing. The St. Dunstan’s crews practised
on Regent’s Park lake, under the direction of a coach, and annually
eventually raced against other regattas on the Thames; they raced
also against sighted crews with success.

The hours devoted to instruction at St. Dunstan’s were short; in
teaching the newly blinded it is necessary to remember that
interest and work are involved. Two-and-a-half hours in the mor-
ing and two hours in the afternoon were spent by the men in the
classrooms and workshops. The employment of many blind instruc-
tors, whose principal work was the education of the blind, greatly
alleviated the work of the after-care instructor. In the progress of
the blind experts gained at once the confidence of the blind soldiers,
who realized that their difficulties were understood and that
nothing beyond their powers was being demanded. Among the officers
and men who were gaining experience practicing at St. Dunstan’s
on professional work, and when it was feasible they were encouraged to
prepare themselves to resume their accustomed employment. The
fact that one of the blinded officers went back to his general as a
barrier, and another renewed his work as a chartered accountant,
may be recorded as examples of the manner in which difficulties
were surmounted. The occupations selected as being most easily
mastered by the sightless man who seeks profitable employment were:
massage, poultry-farming, shorthand-writing (by means of a
machine), telephone-operating, joinery, boot-repairing, mosaic-
making and basketry. All of these were taught, in addition to the art of
typing, which was regarded as being of positive force for
the blind. Many of the blinded soldiers learnt two trades. All
of them acquired proficiency in typewriting and received instruction
in reading and writing Braille.

About 1920 to 1921, when the number of blinded soldiers was
in progress some 60 blinded soldiers were
already employed, largely in military hospitals, as trained masseurs.
They had passed stiff examinations, and it is a remarkable fact that,
in spite of their own disability, they had acquired the power to help
in the care of other wounded men. As soon as the blinded sol-
diers had mastered an occupation they were found employment or
set up in their new industry. Apart from the pensions they received
they were able to earn incomes in some cases higher than they had
had gained as sighted men before joining the army.

Before the close of 1920 1,300 blinded soldiers were established
in different occupations in Great Britain, in Canada, South
Africa, Australia and New Zealand. At that time there were
still several hundred others in training or to be trained. Besides
the soldiers actually blinded in the war, 25,000 were discharged
from the army with seriously damaged eyesight, and from this
number men arrived at St. Dunstan’s by the blind-
ness which had for long threatened them.

Early in 1921 St. John’s Lodge, on the Inner Circle of Regent’s
Park, became the permanent headquarters of St. Dunstan’s
work.

The generosity of the public who supported St. Dunstan’s was
a tribute to the high courage of the blinded soldiers; it made it
possible to do everything that was required for their new start
in life and to create an organization for their after-care. A high
percentage of success cannot be attained in the rehabilitation of
any large body of blind men by training alone. Some definite
assistance is required after men have been trained, supplied with
their tools and equipment and settled in their own homes. A
scheme of organized assistance was first tried on a large scale
by the authorities of St. Dunstan’s. The first concern of the
blind craftsman is his supply of raw material. This must be
constant, of the right quality and nature, and must be available
at a good market price. Lack of sight makes the ensuring of these
efforts, difficult and St. Dunstan’s organization therefore
established a stores and materials department from which
any blinded soldier was able to obtain in small quantities the mate-
rials necessary for his trade. Many hundreds of articles or kinds of
material coming from all parts of the world were always kept in
stock. All goods were supplied strictly at average cost, all
expenses being figuring, so it is necessary to remember the effort of
St. Dunstan’s workers. In order to preserve a constant market, even
in times of trade depression, sales depots were established, and
the men were paid by return of post the average price obtained
when their goods were sold. All expenses connected with carriage
and achieving the sales were paid by the organization. All
articles which were sent up for sale were critically examined, and
any tendency to bad or careless workmanship was quickly stopped.

A staff of experts was employed to visit the men periodically in
their homes where they were able to correct mistakes and
Teach new types of work in local demand. An employment
and propaganda department was established to obtain work for,
and promote the interest of, professional men, and steps were
taken to ensure that their methods of working were modern and
up-to-date. In addition to the administration of the services
mentioned above, a number of convalescent and holiday annexes
were established throughout the country. A fund was available
from which men could obtain grants in cases of sickness, accident
or business difficulty. The Blinded Soldiers’ Children Fund,
which was raised to provide a weekly allowance until the age of
16 years to every child born to a blinded soldier after his disable-
ment, and therefore not pensioned by the Government, was
distributed by this department. The men’s typewriters were
kept in working order, the visitors who went to see the men at
intervals being given a short course of instruction in minor re-
pairs. Music, reading and games were encouraged among the
men, and books, magazines, cards, dominoes, and music were
provided when these were required. In general, St. Dunstan’s
After-Care Organization aimed at reducing a blind man’s handi-
cap to a minimum in order to enable him to compete with his
sighted rivals on even terms.

In the preparation of this article the author gratefully acknowl-
edges the assistance of Mr. Henry Stainsby, the secretary-general
of the National Institute for the Blind, and of Capt. Ian Fraser,
director of the After-Care Organization of St. Dunstan’s. (A.P.)

**BLISS, CORNELIUS NEWTON** (1833–1911), American

merchant and politician (see 4.72), died in New York Oct. 9 1911.
Although prominent in the Republican party and long the

treasurer of its national committee, he would never run for pub-

lic office. His lack of sympathy with Theodore Roosevelt’s

growing influence led him to retire from active politics.

**BLISS, TASKER HOWARD** (1853– ). American soldier,

was born at Lewisburg, Pa., Dec. 31 1853. He graduated from

West Point in 1875, was commissioned second lieutenant,

and in 1880 was promoted to first lieutenant. From 1885 to

1888 he was professor of military science at the Naval War

College; then for seven years aide-de-camp to Gen. Schofield

and inspector of rifle practice, with the rank of captain from

1892. In 1897 he became military attaché at the American

legation in ‘Madrid. In 1898 he became major, and on the

outbreak of the Spanish-American War was promoted lieutenant-

commander, serving through the Port Royal campaign. From 1898

to 1902 he was in charge of Cuban customs and collector for the

port of Havana. In 1902 he became a member of the Army War

College Board, and in the following year commandant of the

Army War College. From 1903 to 1905 he was a member of the

joint Army and Navy Board and also a member of the

general staff. From 1905 to 1908 he held various commands in the

Philippines. During the latter half of 1909 he was president of

the Army War College and a member of the general staff,

and then was appointed assistant chief-of-staff, becoming in 1915

chief-of-staff. In 1917 he was made commanding-general, U.S.

Army, but later in the year retired, having reached the age limit.

He was a member of the Allied Conference (1917), of the Supreme

War Council (1918), and of the International Peace Conference

(1918–9).

**BLOCKADE** (see 4.72).—The blockade enforced against Ger-

many by the Allies in the World War was both in form and extent

without precedent in naval history, and its enforcement has given

a new meaning to the word. It was not a blockade in the strict

sense of the word; that is, a cordon of ships off an enemy’s coast

precluding all approach to it under ban of confiscation. In its

final form it consisted a vast system of economic pressure for

the restriction of enemy supplies, and the power of the British

navy to intercept, detain and search ships and cargoes allowed

remained up to 1917 an essential part of it.

The Declaration of London, under which the navy attempted
at first to enforce the blockade, proved mere filigree, entirely

inapplicable to the intricacies of naval war. It represented an

attempt to reduce prize law to a code, and its effect was to render
the British blockade of Germany futile up to March 1915. Under its rules, food, cotton and all conditional contraband could not be touched so long as they were discharging at neutral ports such as Rotterdam or Copenhagen. One saving clause had been added in an Order of Council of Aug. 20, 1914, which permitted some latitude by rendering such cargoes liable to capture if there were sufficient evidence of enemy destination. Unfortunately even this safeguard was swept away by a British Order in Council of Oct. 29, 1914 which restricted seizure of conditional contraband to goods consigned to “order” or without a named consignee, a regulation which promptly produced a vast crop of dummy neutral consignees and rendered the blockade ineffective for five months. No further action was taken against food-stuffs, and for five months a succession of ships streamed daily through the Downs, bound for Holland and Scandinavia with food and cotton for Germany. Four cargoes only were placed in prize, whereupon the prize court in London proceeded to sweep all the veneer of rules away and adjudged that a “named consignee” must be a bona fide and not a dummy consignee (British and Colonial Prize Cases, the “Rijn,” June 6 1917).

The judgment has an important general bearing, for it constitutes a justification from the naval point of view of the established system of adjudication by a qualified court, where general principles are applied to particular cases in the light of experience and common sense, compared with a system based on a code operated by busy officials under a hurried Secretary of State.

It was not until March 11 1915 that the blockade was tightened up with the formation of the Combined Grand Council, which authorized the seizure of ships with enemy destination or of enemy origin became liable to seizure, and it was not till July 7 1916 that the broken shards of the discredited Declaration of London were finally swept out of the way. It was not a code but machinery that was wanted, and by March 1915 the machinery was beginning to take shape. The part played by the British navy consisted in the interception and examination of ships, which was under the purview of the Trade Division (Capt. Richard Webb) of the Admiralty. A British Contraband Committee, with representatives of the Admiralty (Capt. Horace Longden and Lt.-Comm. W. E. A. Arnold Forster), Foreign Office and Board of Trade, had been set up in 1914 to decide whether a ship or cargo was to be sent in for adjudication. Its necessary adjunct, a War Trade Intelligence Department to collect and collate information of ships and cargo, was established somewhat later. The code disappeared, and each cargo was dealt with on its merits.

The British naval work directly associated with the blockade fell under two heads—the work of the blockade squadrons at sea and the service of naval control. It was the function of the blockade squadrons to patrol the avenues to the ocean, intercept neutral neutrals or submarginal ships, and to examine their cargoes and papers. This was the task of the 10th Cruiser Squadron, one of the hardest tasks of the war and one which has received perhaps too scant a meed of praise. The squadron consisted at first of Edgar class cruisers, but being unable to stand the terrific seas of the North Atlantic they were withdrawn and their place taken by large armed merchant cruisers (18 in number, in Nov. 1914) under the command of Rear-Adml. Dudley de Chaix (succeeded in 1916 by Vice-Adml. Sir Reginald Tupper). In the South the conditions were different. The configuration of the coast, the fear of minelayers and destroyers, and the number of patrol ships at Dover resulted in all traffic being shepherded well within the Downs, and this practically dispensed with the difficult task of interception. The practice of performing the search of ships in harbour was an innovation, and it remains one of the outstanding lessons of the war that “visit and search” (if the search involves an effective examination of the cargo) cannot be effectively performed at sea, partly on account of the complexity and difficulty of the work under modern conditions, partly on account of the danger of submarine attack. Ships were accordingly sent into harbour to be searched, and though the dispatch of neutral ships into harbour was undoubtedly a considerable extension of the universally recognized right of visit and search, it was an extension inherent in the circumstances, for without it the search would have become ineffective and the right null and void. The practice, however, involved some nice legal points, such, for instance, as whether a ship sent into a harbour by force majeste to be subjected to visit and search comes under the full force of municipal jurisdiction and of port regulations which would have subjected a huge Norwegian liner to quarantine for a case of smallpox on board.

The patrol lines of the 10th Cruiser Squadron stretched at first from Norway to the Shetlands (250 m.), but as the submarine menace extended they were moved to the westward and lay sometimes between Iceland and the Hebrides, sometimes between the Shetlands and Faroes (160 m.), and the Faroes to Iceland (160 m.). The average weekly number of vessels intercepted in 1915 was about 66, of which some 15 to 20 were sent weekly into Kirkwall with an armed guard. It was the duty of the officer of the armed guard merely to ensure that the ship was steering a proper course, and he did not interfere in any way with the ordinary navigation or administration of the ship. Little has been written of the work of the 10th C.S., but its dangerous nature can be gathered from the number of its ships lost by mine and submarine. In 1915 its losses amounted to four. The “Viknor” (Comm. E. O. Ballantyne) was lost with all hands, off the coast of Ireland (Jan. 13), probably on a mine; the “Clan Macnaughton” was supposed to have foundered (Feb. 3); the “Bayano” was sunk by U27 on March 11 off Galloway; the “India” by U23 off the coast of Norway on Aug. 20. The “Alcantara” (Capt. Thos. E. Wardle), which sank the raider “Grief” on Feb. 29 1916, belonged too to this squadron, whose name was afterwards in the Coehold word in the blockade. The institution of the white-list and black-list, which gave an indication of a ship’s nature, and the issue of green clearances to neutral ships sailing from British ports, facilitated the work of interception; and by March 1915 nearly all the more important neutral lines had agreed to call at Kirkwall or the Downs in order to avoid the delay of being intercepted far out at sea and losing time in putting back.

In 1915 the number of vessels intercepted by the 10th C.S. was 3,508, of which 745, or 24%, were sent into Kirkwall; the remainder, including 817 fishing vessels and 408 British and Allied ships, were allowed to pass. During the same year 10 ships succeeded in evading the patrols, of which only eight were of real consequence, a comparatively small number in view of the long northern nights full of wind and frost and snow.

The port of control and detention in the North was Kirkwall, which provided a large enclosed harbour where ships could be safe from the sea and the enemy. The average number of ships calling and sent in was some two or three a day in 1915, but in the latter part of 1916, when Dutch traffic began to go north for a time, it rose to five or six.

The Downs (Comm. W. Moorsom and Capt. Walter Tomlin) was far the largest control station, and had the really immense task of dealing with three-quarters of the neutral trade of northern Europe. All the Channel traffic up and down had to be shepherded through, and here some 10 to 15 neutral ships had to be examined daily. The manifest was taken off, sent ashore, summarized (no light task in the case of big Dutch East Indies cargo ships) and telegraphed to the Contraband Committee. The ship outside the hold was searched for contraband and German mail-bags, and some of the items in the hold were examined and compared with the manifest. To examine and search a large liner and the luggage of some 20 passengers took to officers and 20 picked men the best part of 18 hours. German women were searched by lady-searchers and allowed to go on. Meanwhile the manifest was examined by the Contraband Committee in the light of the knowledge they had of ships, cargoes, consignors and consignees, and instructions sent to clear the ship or to send her in to discharge all or a portion of her cargo, or to detain her till guarantees were received. The ordinary period of detention for ships eastward bound was one to three days, for ships westward bound a day or less. A smaller control station at Falmouth relieved the Downs of a portion of its burden.

The power of naval interception, visit and search, was in itself a powerful form of pressure, for neutral shipping companies in
order to avoid delay preferred to send lists of their cargo in
advance and to make reciprocal arrangements for rapid clearance.
It was, however, only a single weapon in the armoury of eco-
nomic pressure. Control of bunker coal, shipping insurance, censor-
ship and cables, all found their place there, and formed the basis
of agreements with large corporations of merchants formed for
the purpose, such as the Netherlands Oversea Trust (N.O.T.)
for Holland, the Danish Merchants Guild for Denmark, the
Société Suisse de Surveillance Economique (S.S.S.) for Swit-
zerland. Sweden took a different line and made all such agreements
illegal, maintaining this attitude till April 1917. She was be-
yond the reach of British sea power, and the Lulea iron-ore trade,
though attacked with consistent and effective enthusiasm in 1917
remained the principalstay of the German munition industry.

The fundamental problem of a blockade of this type is to
discriminate between enemy and neutral destination, and the
two principal systems of discrimination may be termed the
"Intelligence" or "evidential" system and the "Rationing" or
statistical system. In the first, particular cargoes or items in a
cargo become suspect if there is any evidence of enemy dealings.
In the second, the whole mass of importation becomes suspect
immediately it rises above the normal average of imports. The
blockade emphasized the weakness of the former system, which
required enormous labour and specialized knowledge to keep track
of possible enemy dealings, and as early as Jan. 1915 the "Ra-
tioning" or statistical system was being advocated, and it was
proposed that careful account should be kept of the imports of
all important commodities, and when the import figures to any
neutral country rose above the average for no accountable
cause, a plea for confiscation should arise. To keep these sta-
tistics, which were largely based on the manifests, the War Trade
Statistical Department in London came into being, and in 1916
the principle of rationing was adopted by the Minister of Blockade
as the fundamental system of his system. But here also a difficul-
ty arose which was never completely solved. Legal sanction for
condemnation was difficult to obtain on the basis of figures alone,
for statistics supplied no direct evidence of enemy destination and
the system had to be largely operated by means of assurances
and agreements. But, in spite of difficulties, by the middle of 1916
the blockade was becoming really effective. It began with an
excellent (but spurious) code and no machinery; it ended with
excellent machinery and no code.

There can be no question that the World War has greatly
modified our conceptions of blockade. One of its most important
lessons is that discrimination between belligerent and neutral
destination is possible and can be enforced without friction, if
only the principle be admitted that a belligerent who controls
the sea is entitled to ask for evidence or assurance of genuine
neutral trade. Mercantile cooperation can then be invoked with
official approval to supply the machinery for such assurance.
This does not mean the legal prohibition of contraband trade,
but it means that such trade would gravitate into particular
ships which would have to run the blockade. As the sphere
of agreements and economic action extended, the role of the
first diminished, though there still remained certain sections of
trade either immune from attack or which could be reached only
by the fleet. Examples of such sections of trade were the
German iron-ore trade with Lulea in the Baltic Sea, and the
iron-ore trade with Narvik in Norway. A score or so of
German ships were engaged in the latter, passing down the
Norwegian coast inside Norwegian waters, but there were two
areas, one off Stattlandet and the other off Ekersund, where they
had to leave neutral waters, and these were periodically visited,
though not permanently patrolled. Ships were also constantly
passing from Rotterdam to Germany, and it was not till
1917 that determined efforts were made to stop this trade.

In 1917, when the United States came into the war, the block-
ade underwent a great change. The Allied Powers in conjunction
with the United States now possessed an almost complete con-
trol of many of the principal commodities, and the combined
pressure they exerted was so tremendous that the goods never
got as far as the sea, and the blockade was practically trans-
formed into an embargo.

The final cutting edge of the blockade in 1917 and 1918 was
enforced not at sea but on the custom house quays at Boston,
Liverpool and New York. The ships of the 10th C.S. left their
stormy beats to do convoy work. The Downs and Kirkwall lan-
guished, and the control services were transferred to Halifax,
Jamaica and Sierra Leone.

The fact that many forms of economic pressure contributed to
the blockade must not blind us to the fact that they were to a
large extent aspects of sea power. Thus, bunker control, a power-
ful lever of the blockade, was enforced by the British Customs
at all the principal British coaling bases abroad which had
been won by sea power and remained dependent on sea power.
Where the arm of the British navy could not stretch the block-
ade broke down. The frontiers of Rumania were impervious to it
and enabled Germany to hold out until 1917. To the last the
Lulea iron-ore trade remained a menace, for sea power could not
reach so far. In its bulk the blockade remained an expression
of sea power, with the imminence of the Grand Fleet going and
coming ceaselessly behind it in the North Sea.

(A. C. D.)

BLOEMFONTEIN (see 4.74).—Pop. (1918): whites 15,631,
coloured (estimated) 16,000. The most centrally situated town
among the Trans-Cape towns, B. is a market centre for agricul-
tural and pastoral produce of the Free State. The annual sale of pure-bred stud stock, held in Sept.,
is the principal fixture of the kind in South Africa; in 1920 the pedigree stock sold realized £283,000. The growth of the town
during 1910-20 was largely due to the progressive policy
of the municipality, which provided it with an ample supply
of water, electric light, an electric trackless tramway system,
modern sewerage system and other public services. In 1918 the
rateable value of the municipality was £3,835,000, its revenue
£182,000 and its indebtedness £563,000.

Among modern buildings are the new Law Courts (in the classical
style); the National Bank; the United States Consulate U.;
the Dutch Reformed Church; Grey College, the Government
Buildings (which replace those burned down in 1908) and the Legislative Council Chambers
(the seat of the Appellate Court). A monument to the women
and children who died in concentration camps during the war of 1899-
1902 was erected in 1913 near the Show ground. The principal work-
shops of the Union railways are situated in the town of B. A
new, large passenger station, B. C. & W. Ry., was opened in 1916, with a platform and
12,000-seat capacity. Grey College, incorporated as a university college in 1916, has
been since 1918 the principal constituent college of the university
of South Africa. Besides the university college the institution in-
cludes high schools for boys and girls, and the buildings stand
in an extensive surrounding park of 800 acres. At Glen, 14 m. N., in an area of
4,000 acres, the British Union of South Africa, Boer War Memorial College, opened in 1919, with an experimental farm of 4,000 acres.

A military station at Tempe, 4 m. from the centre of the
town, and here is the Defense College for Officers.

BLOMFIELD, Sir Reginald (1856— ), English architect
and author, was born Dec. 20 1856 at Aldington in Kent,
_of a family connected with the county lawyers. His father was rector
at Haileybury and at Oxford as a scholar of Exeter College. He
took his degree with a first class in literae humaniores in 1879.
On leaving Oxford he was for three years in the architectural
office of his uncle, Sir Arthur Blomfield, and also studied in the
Royal Academy School of Architecture. He was here largely
influenced by Norman Shaw, to whose work and example, as
also to those of Philip Webb, his own work owed much. After
travelling abroad in 1883, he started a practice in London in
1884. He became one of the secretaries of the Art Workers
Guild, and also of the Arts and Crafts Society. The Gothic and
Medieval tradition of his uncle’s office had but little effect on
his work as an architect, which rather follows the classical spirit
and the inspiration derived from the later Renaissance architec-
ture of England. This is shown notably in his country-houses,
amongst which are Moundsmere, Basingstoke; Wyphurst,
Cranleigh; and Uretham Hall, Norfolk. He also carried out
alterations to existing houses at Brookley Park, Linoleum, Ape-
thorpe, Northants.; Chequers Court, Bucks. and elsewhere. Amongst his London works are the United University Club, Pall Mall; the Goldsmiths' College, New Cross; the London and County Bank; the Imperial War Cross, Chelsea; and Paul's Cross, St. Paul's Churchyard. At Oxford he built the new buildings for Lady Margaret Hall, and at Bath the Holbourne Museum. With Sir Aston Webb and Ernest Newton he was appointed to advise as to the architectural treatment of the Quadrant, Regent Street, London, and he designed a portion of the façade.

As author Sir R. Blomfield is known by various important works of history and criticism. His Academy School Lectures were published in 1908 as The Mistress Art. His Formal Garden in England (1892), published in collaboration with F. Inigo Thomas, did much to make known the claim of the architect to consider as his right not only the design of the building but of the surroundings in which it was set. His History of Renaissance French Architecture (1911 and 1921) are accepted by students as textbooks, and their illustrations show the author's considerable powers as a black-and-white artist.

Sir R. Blomfield was elected A.R.A. in 1905, and R.A. in 1914, in which latter year he was also made Officier de l'Instruction publique by the French Government. He was professor of architecture at the Royal Academy from 1906 to 1910. He was elected president of the R.I.B.A. in 1914, and received its Gold Medal in 1913.

As an old member of the Inns of Court volunteers, at the commencement of the World War he received a commission as officer in charge of trench work. At its termination he was appointed a principal architect of the Imperial War Graves Commission, and he was one of the chief designers of various forms of local war memorial. In 1916 he was made hon. fellow of his college, and in 1920 Liverpool University conferred on him the hon. degree of Litt.D. He was knighted in 1919 in recognition of his work as architect and author.

**Blue Sky Laws.**—This name is popularly applied in the United States to those statutes enacted in many states to protect from fraud purchasers of stocks and bonds. The first Blue Sky law was passed in Kansas in 1911, requiring investment companies among other things to file with the Secretary of State a full description of their business and requiring them to sell securities until authorized by the bank commissioner. Following the Kansas model, within two years no fewer than 18 other states had enacted similar legislation, and by the close of 1919 some form of Blue Sky law was to be found in 44 states. Requirements vary in the different states, but in every case information must be filed with a designated official or commission and licence obtained. In 1914 there developed considerable opposition to such legislation. Its constitutionality was attacked on the ground that it violated the commerce clause of the Federal Constitution; that it delegated legislative and judicial power to an executive official; that it deprived citizens of liberty and property without due process of law. In three states—Indiana, Iowa, and Ohio—the questions were upheld by the lower courts; but in 1917 the U.S. Supreme Court decided that such laws were constitutional on the ground that "prevention of deception is within the competency of government."

**Blunt, Wilfrid Scawen (1840-1918),** English writer (see 4.93), published a complete edition of his poetical works in 1914 and two volumes of My Diaries (1919 and 1920). His wife, Lady Anne Blunt, became Baroness Wentworth on the death of her niece, the daughter of the 13th Bar and 3rd Earl of Lovelace, in 1917. She completed a History of the Arabian Horse just before her death in Egypt Dec. 25 1917. She was succeeded in the title by her daughter Judith Anne Dorothy, wife of Neville Stephen Lytton (b. 1879), 4th son of the 1st Earl of Lytton.

**Bodington, Sir Nathan (1848-1911),** vice-chancellor of Leeds University, was born at Aston May 29 1848. A gradu-

---

**Boehm von Bawerk, Eugen (1851-1914),** Austrian economist and statesman (see 4.112), died in 1914.

**Boehm-Ermolli, Eduard, Freiherr von (1856-1918),** Austro-Hungarian field-marshal, was born in 1856 at Ancona, then an Austrian garrison town. He entered the army, serving in the cavalry and on the general staff. In the World War he commanded the 2nd Army, fighting first in Serbia, then against Austrians in Galicia and Poland. In the operation of the pursuit of the enemy after the battle of Gorlice he captured the Galician capital, Lemberg, on June 22 1915. He also played a distinguished part in the summer offensive of 1917. After the conclusion of the peace of Brest-Litovsk he marched into the Ukraine, and directed from Odessa the measures for turning to account the resources of that country. In numerous battles Boehm-Ermolli showed his capacity as a general in the field, and was highly appreciated by the Germans.

**Boismaudran, Paul Emile Francois Lecomte de (1838-1919),** French chemist, was born at Cognac in 1838. He was the discoverer of gallium, which he announced on April 18, 1875, and for which he received a prize generally, on which he wrote several treatises. Some details as to his work appear in 5.761; 6.463; 8.208; 11.421, 177. He died in Paris May 31 1912.

**Boito, Arrigo (1842-1918),** Italian poet (see 4.153), died June 10 1918.

**Bolderwood, Rolf, the pen name of Thomas Alexander Browne (1826-1915),** Anglo-Australian novelist, was born in London Aug. 6 1826 and was educated at Sydney College, N.S.W. He had an adventurous early life in Australia, being successively a sheep farmer, a pioneer squatter in Victoria and a mining adventurer in South Australia. He passed through a varied colonial experiences furnished him with material for his long series of bushranging novels, of which Robbery under Arms is the most widely known. This book was published in 1888 in London after it had run as a serial in the Sydney Mail. Amongst his other books are The Miner's Right (1890); A Modern Buccaneer (1894); The Babes in the Bush (1900) and A Tale of the Golden West (1906). He died at South Yarra, Melbourne, March 12 1915.

**Bolivia (see 4.165),** No census had been taken up to 1921 since the rough census of 1910, indicating 1,816,271 inhabitants. In 1910 a Bolivian publicist estimated the pop. at 1,744,558. An official estimate in 1920 set the pop. at 2,500,000. The inhabitants are scattered through eight departments and three "national colonial territories," the most densely populated region being the department of La Paz. The pop. of the city of La Paz in 1920 was estimated at 107,252.

**Government.**—The fundamental law of Bolivia was in 1921 still the constitution adopted in 1880. In 1910 some changes were made in the official nomenclature of towns and cities; and in 1914 a law was promulgated which abolished vice-cancions. Although—according to the statutes—Sucre is still the capital of Bolivia and remains the residence of the President, the seat of government is the city of La Paz, where the National Congress assembles regularly, the members of the Cabinet have their bureaus, and where the president of the republic lives.

**Communications.**—In accordance with the Treaty of Petropolis, (1907), the Brazilian Government began in Aug. 1907 to construct a railway round the series of cataracts in the Madeira and Mamoré rivers, from São Antonio on the Madeira river to Guajara Mirim on the Mamoré river (Brazil). The Madeira-Mamoré railroad was formally opened to traffic on July 15 1912. Bolivia then undertook to build a line between the Bolivian towns of Guajara Mirim and Riberalta on the Bení river, in order to link her rubber-producing region with Amazonian navigation. In accordance with Bolivia's treaty of 1904 with Chile, that Government constructed a railway from Arica to La Paz, which was completed May 13 1913. Thus Bolivia was furnished with a direct route to the Pacific. An electric railway, financed by New York capitalists, was being constructed in 1921 from La Paz to Coroico in the Yungas region,
and is to be extended to Puerto Pando. The Antiguagsta and Oruro railway now reaches La Paz by its own tracks. A branch line has been constructed from Rio Mutilo to Potosí. In Nov. 1916 the line began to carry traffic and the completion of a line from Potosí to Sucre. Another branch from Oruro to Cochabamba was inaugurated in July 1917. A most important road was being constructed in 1921 between Uyuni and Tupiza near the Argentinian frontier. In 1919 the government running between Uyuni and Atocha, while automobile service had been established between Atocha and La Quiaca (Argentina). Many miles of new telegraph lines have been built and on 30th March 1920 Maroni connected wireless stations at several points in Bolivia. In Oct. 1920 the first wireless message from La Paz was received in Lima.

Commerce.—Official figures show that in 1928 the total imports of Bolivia amounted to 30,926,856 bolivianos (see below under Money and Banking), while her exports came to 48,925,616. In 1915 the imports were 22,574,566 bolivianos; the exports 95,210,356. The countries taking the largest amounts of the exports were, in order: Germany, 13,600,000; France, 7,022,630; the United States, 5,159,000; Argentina, 4,600,000; the United Kingdom, 2,060,000; Spain, 933,000. The largest amounts of the imports were the United States, Peru, Great Britain, China and Argentina. The imports for 1918 amounted to 34,999,866 bolivianos, while the exports came to 182,612,850. This was an increase over the preceding year in imports of 1,510,055 bolivianos and in exports of 24,844,796. The chief articles imported into Bolivia in 1918 were in the following categories: Manufacures, 8,857,367; manufactured articles, 16,229,072; raw and slightly wrought materials, 7,022,630; live animals, 2,040,632. The most important articles of export were tin, 129,011,139 bolivianos, rubber, 11,600,000; silver, 7,941,395; nickel, 4,657,234. Being compared with 1915 the figures for 1918 show that the United States had increased her imports from Bolivia about 200%, while Great Britain had increased her imports about 350%. The figures for 1913 show that the value of the imports of Bolivia from Great Britain had increased slightly, while imports from the United States had grown more than 137%.

The Bolivian cavalry is composed of the regular army and the reserves. Ordinarily the number of soldiers belonging to the regular army is fixed by Congress each year; in 1914 it was placed at 4,600 men. All male citizens between 19 and 49 years of age are called to military service. The same is true for the reserves, which are composed of private citizens. As the citizens of the United States have founded an "American Institute" at La Paz, and also at Cochabamba: these academies are probably the best secondary schools in Bolivia. In the same year that the United States was admitted to the regular army or in the reserves. The reserves in 1914 were estimated at 187,178 men.

Education.—A Bolivian sociologist declared in 1910 that less than 13% of his fellow-countrymen could read. Primary instruction is still practically non-existent and can be obtained only at schools which have recently been paid to the establishment of rural schools, as well as to the instruction of aborigines in the Spanish language. According to the figures of the Census of 1921, 378,860 children were attending schools, of which 350,980 were in primary schools and 29,935 in secondary schools. The instruction was under the charge of the Ministry of the Interior. In 1919 there were some 700 schools, primary and secondary. As to the public institutions of higher education in Bolivia, the following can be mentioned: the University of La Paz and, also, the University of Sucre. Under Manú, these universities are doubtless the best secondary schools in Bolivia. The universities of La Paz and Sucre are now under the charge of the Ministry of Education.

Banking.—Early in 1908 Bolivia had only a small internal debt composed of bonds of various sorts. In Dec. of that year the Republic negotiated a loan with J. P. Morgan & Co. of New York amounting to $500,000. Subsequently three loans were floated in France to secure funds to promote banking enterprises, and another loan was raised in the United States for the construction of the railway from Tupiza to La Quiaca. Bolivia's proposed budget for 1919 estimated the revenue at 39,689,000 bolivianos, and the expenditure at the same amount. Proposals of expenditure, according to the budget, were as follows in bolivianos: Treasury, 14,600,000; War, 6,300,000; Interior and Public Improvements, 5,506,000; Public Instruction, 12,000,000; the Secretary of Public Instruction, 1,920,000; and others, in the amount of 7,504,000 bolivianos. On June 30 1919 the total foreign debt was 51,114,682 bolivianos. The internal debt was composed of bonds aggregating 19,456,165 bolivianos, and a floating debt of 16,477,471 bolivianos. The following are the principal banks of Bolivia: the Banco Central de Bolivia, 575,000; the Banco de la Nación, 50,000; the Banco Hipotecario, 100,000; the Banco Nacional de Bolivia, 100,000; the Banco de la Nación, 100,000; the Banco Hipotecario, 100,000; the Banco Francisco Argendona, 4,000,000; the Credit Hipotecario de Bolivia.

History.—On Aug. 6 1909, President Montes was succeeded by Elidoro Villazón. Under him much economic progress took place: foreign commerce and national revenues increased, and railway and telegraph lines were constructed. Gen. Ismael Montes was again inaugurated president on Aug. 6 1913. During his new administration Bolivia felt the effects of the World War; there was a marked decline in her imports. Increased attention was paid to the mining of copper, tin and wolfram. José N. Gutiérrez Guerra, a Liberal who had served as Secretary of Finance under Montes, was inaugurated president in Aug. 1917. Shortly afterwards the agita- tion resulted in an outbreak in the Pacific reached an acme. In July 1920, because of increasing the size of the fleet apparently aimed at a rapprochement with Chile, Guerra was forced to resign, and was escorted out of Bolivia by way of Arica. Early in the following year Bautista Saavedra, a Republican, was elected president. He was inaugurated Jan. 29 1921.

According to a treaty with Peru, Sept. 17 1909, a survey of the Bolivian-Peruvian boundary was begun by a mixed commission in June 1910. By 1915 the commission had virtually completed the demarcation of limits, and wooden monuments had been set up on the boundary line. In the following year the two governments agreed to replace these posts by pillars of iron. Commissioners, appointed in accordance with the Treaty of Petropolis (1903), to survey the boundary line between Bolivia and Brazil, had by 1920 practically completed the task of demarcation. According to the protocol between Bolivia and Argentina dated Sept. 15 1911, surveys of the Bolivian-Argentine boundary line, which had been suspended since Oct. 1902, were resumed in 1913, and a joint commission placed iron stakes along part of the line. A treaty signed at Asunción on April 5 1913 between Bolivia and Paraguay provided that their border dispute should be adjusted by direct negotiations. Commissioners of the parties soon undertook negotiations, documents were submitted in support of the respective claims, but no definitive decision had been reached in May 1921. Bolivia asserts a claim to territory on the right bank of the river, Paraguay from the mouth of the Pilcomayo river at least as far as lat. 22° S.

Early in the World War, Bolivia showed her sympathy with the cause of the Allies. Some young Bolivians proceeded to Europe and enlisted under the French flag. In Feb. 1917 Bolivia issued an invitation to the American nations asking them to form a maritime commission to mark the boundary. As no American maritime commission had been formed, neutral merchant vessels were contrary to all law. On April 13 1917 her Secretary of Foreign Relations gave the German envoy at La Paz his passports, declaring that, as a steam-ship navigating neutral waters with the Bolivian minister to Berlin on board had been torpedoed by a German submarine, the Government of Bolivia could no longer maintain diplomatic relations with the Imperial Government. Bolivia was represented at the Versailles Peace Conference, and on June 28 1919 her representative signed the Treaty of Peace with Germany. The Bolivian Government ratified the treaty on Nov. 16 1920. As a result of that treaty Bolivia became an original member of the League of Nations.

The question of an outlet to the Pacific raised by the territorial cessions of Bolivia to Chile as the result of the "War of the Pacific," was in 1921 a crucial international problem. The policy of Bolivia under various presidents had been to secure the sovereignty over territory containing an outlet to the Pacific Ocean. At times she had wished to secure the return from Chile of her former department upon the Pacific; at other times by negotiations with Chile she had aimed to acquire at least a portion of the former provinces of Tacna and Arica. Ex-President Montes, who was dispatched to Europe as Minister of Bolivia by President Gutiérrez Guerra, presented to the Peace Conference a plea that his country should be given an outlet through Tacna. Evidently the new Bolivian regime was
in 1921 in harmony with the Peruvian Government with regard to the question. Bolivia's aspirations had apparently again turned toward the "revindication" of Antofagasta.

(1913-9); Monthly Bulletin of the International Bureau of the American Republics (1910-21); Pan-American Union, Bolivia, General: Descripción de Bolivia (1909-20); P. Waller, Bolivia: Its People and Its Resources, etc. (1914).

BOLO, PAUL (d. 1918), French financial agent and traitor, was born at Réunion, of humble parentage. He became at an early age a dentist in Marseilles, and afterwards appears for many years to have lived by his wits. In 1905 he made a gigantic marriage with the rich widow of a Bordeaux wine merchant. He entertained lavishly in Paris and Biarritz, and was received by many influential people, in spite of the fact that he underwent a term of imprisonment for fraud in connexion with one of his financial transactions. In 1914 Bolo met in Paris Abbas Hilmi, khedive of Egypt, to whom he proposed various financial schemes, and the Khedive bestowed upon him the title of "Minister of Finance." In 1915 Bolo and his proteges, have entered into communication with German agents for the purpose of supporting a "defeasist" movement in certain Paris newspapers. In 1915-6 he travelled in the United States, and received considerable sums, amounting to over £50,000, from representatives of Count Bernstorff, at the time German ambassador to Washington. During 1917, however, the French Government under M. Clemenceau displayed much energy in hunting down treasonable conspiracies, and in Sept. 1917 Bolo was arrested. His trial by court-martial, begun on Feb. 4 1918, ended in his being found guilty of treason. Attempts were made to connect M. Caillaux with Bolo's proceedings, and Caillaux's acquaintance with the adventurer was brought up later to his discredit at his own trial in 1920. A sensational feature of Bolo's trial was the appearance of Monsignor Bolo, brother of the accused and a well-known preacher in Paris, as a witness for the defense, though as he had hardly seen his brother for thirty years, his evidence was of small value. Bolo was sentenced to death and shot at Vincennes, April 17 1918.

BOLSHEVISME, the name given since the Russian revolution to the form of Communism adopted under the Soviet system of government. Bolshevism as a doctrine and an organization is not of purely Russian growth; it is a branch of European Communism. The development of the latter is discussed in the article COMMUNISM. The earliest and most powerful expression of modern Communism is to be found in the Communist Manifesto drawn up by K. Marx and F. Engels in 1847. This Manifesto has remained a kind of gospel for extreme Communists, and its pronouncements served as a guidance in the attempt of the Russian Bolshevics (Russian for "Majority" party) to create a Communist republic in Russia. Another element in the circle of ideas appropriated by the Bolshevics was provided by the activity of Bakunin, the indefatigable Russian anarchist, who fought for world revolution in 1848 in Dresden and in 1870 in Lyons, and who passed 12 years of his life in prison and in exile. He was an admirer of Marx's learning and analytical power, but he would never submit to the tyrannical podasty of Marx's school and stood up for an elemental awakening of revolutionary instincts. State and law were enemies to be fought and overthrown without any regard for tradition or practical considerations. A third element was introduced by the rise of militant syndicalism in France (see SYNDICALISM). These three currents combined to produce the three fundamental ideas of Bolshevism: the conquest of society by the proletariat class, the power of revolutionary instinct and the dictatorship of a compact minority.

The combination proved admirably adapted in Russia for the practical purpose of the overthrow of the previously existing order. Theoretically a socialist movement and a component of contradictory elements. This was a clearly discerned and explicit call to a leading Marxist writer, Kautsky. He said in his book on the Dictatorship of the Proletariat:—

"The Socialist party which governs Russia to-day gained power in fighting against other Socialist parties, and exercises its authority while excluding other Socialist parties from the executive."

The argument of the Russian Bolshevism is, therefore, not based on small personal jealousies; it is the clashing of two fundamentally distinct methods, that of democracy and that of dictatorship.

"For us, therefore, Socialism without democracy is unthinkable."

Kautsky had no difficulty in showing that, in consequence of this fundamental flaw, the practical results of Soviet rule were deplorable. It was obliged to work by means of an unwieldy bureaucracy:—

"The absolute rule of bureaucracy leads to its ossification, to arbitrariness and stultification. The forcible suppression of all opposition is its guiding principle. How can a dictatorship remain a dictatorship against the great mass of the people?"

"In circumstances where the majority of the population mistrust the proletarian party, or stand aloof from it, this attitude would be shared by the bulk of the intellectuals. In that case, a victorious party would not only be in the majority among the rest of the people, but would even be inferior to its opponents in this regard, although its outlook in general social matters might be a much higher one."

The method of Paraguay is therefore no practicable in Europe. There remains to be considered the method adopted by Napoleon the First on Brumaire 18 1799, and his nephew, the third Napoleon, on 20 Nov. 1852. This consists in governing by the aid of the superiority of a centralized organization to the unorganized masses of the people, and the superiority of military power, arising from the fact that the armed force of the Government is opposed to a people who are defenseless or tired of that arm struggle the people."

"Can a Socialist system of production be built up on this foundation? This means the organization of production by society, and requires economic self-government throughout the whole mass of the people. State organization of production by a bureaucracy, or by the dictatorship of a single section of the people, does not mean Socialism. Socialism presupposes that broad masses of the people have been accustomed to organization, that numerous economic and political organizations exist, and can develop in perfect freedom. The Socialist organization of Labour is not an affair of barracks."

No wonder that Lenin and Trotsky were highly incensed by Kautsky's criticism. They excommunicated him as a traitor to the cause, along with other Socialist leaders. But it was significant that they had to adopt the badge of "Communism" in order to mark their precise position in the field of rival doctrines. They had ceased to be Socialists in the accepted sense of the term.

The cause taken by Bolshevik rule in Russia is narrated in the article Russia.

BOMBTHROWERS.—When, contrary to all expectation, and therefore to all ideas that had governed war preparations, the World War, instead of reaching its decision in the open field, came to the deadlock of trench warfare, there arose a demand for short-range engines which could throw bombs to a greater distance than was possible by hand, or, alternatively, could throw heavier bombs to the same distance.

Eventually this need was met by the development of trench mortars and trench guns, many types of which were loosely called bombthrowers, but all of which are differentiated from bombthrowers in the sense here meant by the fact that they used an explosive propellant. These are dealt with under TRENCH ORDNANCE. But in the first phases of trench warfare such ordnance either did not exist at all or existed only in such small numbers and in so imperfect a form, that for the needs of day-by-day trench warfare along the front temporary substitutes were evolved. To these substitutes the name "Bombthrower" is—so far as army usage is concerned—restricted.

They relied for their propulsive effort, like ancient and mediæval engines, on the energy of springs. In some cases the spring was a system of powerful rubber pieces put in tension when the weapon was cocked and suddenly released by the pulling of a
trigger. In one case the source of power was an assemblage of coiled springs. In others, the rubber was replaced by a system of wire, the rubber bent out of shape, stored up the power to reassert itself. In another, perhaps the last evolved during the war and certain one of the most ingenious, centrifugal force was utilized, without previous storage of power.

Under the heading of bombthrowers as above defined should also come the class of pneumatic guns, certain representatives of which figured in the war on both sides, but owing to the general similarity of these to normal (i.e. explosive-propellant) trench ordnance they are treated along with the latter.

In naval usage, on the contrary, the term is applied to explosive-propellant derivatives of trench ordnance which were mounted on trawlers and other craft for the purpose of attacking sub-trenches. The object was to throw for a certain distance very heavy charges of explosive that, equipped with a hydrostatic fuze, would act in the same way as depth charges. These bombthrowers are dealt with under ORDNANCE: Naval Gunnery.

The "West" spring gun, used by the British army in 1915 and to some extent in 1916, was a heavier and more powerful weapon. It derived its energy from a group of strong coiled springs; for a shorter range, no less than 25 of these "spring" types were brought into action. The general principle of action is shown in fig. 2. The weapon having been well bedded in with sandbags for steadiness, the throwing-arm which carries the bomb-cup is forced back-wards and downwards, against the resistance of the springs, by means of a long lever inserted in an appropriate position for leverage. When the "trigger bar" on this arm engages with a member called the trigger hook (visible in the drawing under the bomb-cup and just above the plane of the figure), the gun is cocked. When a trigger is removed, a bomb placed in the bomb-cup, and the gun is then fired by pressing on the horizontal lever which actuates the trigger release. This disengages the trigger hook from the trigger bar, and under the force of the springs the throwing-arm, carrying the bomb, flies up. The range obtained with this weapon using a 2 lb. bomb was about 240 yd., 24 springs only being in action. Variation of range was obtained, as in the catapults, by varying the tension, but also, in this case, by adjustments of the position of the bomb in its cup. The West spring gun was an ingenious design, which probably comes near the limit of efficiency obtainable in applying the force of springs to an act of throwing. But it was heavy, and not very easily managed, and required as large an emplacement as a trench mortar.

The Minuciani bombthrower, though it appeared late in the war—after trench engines of the 1915 type had had their day—was probably the most efficient and ingenious weapon of its class. It was a large metal casing, circular, supported on a pedestal. Inside the casing was a revolving member, formed somewhat after the fashion of a centrifugal pump. Cylinders of a special design (disc percussion) were fed into the "pump" through an opening in the casing, and when the pump was operated by turning a handle, they were expelled by centrifugal force through another opening in the casing. Extraordinarily high rates of discharge were obtained with accuracy, combined with this machine, which could throw the bombs practically as fast as they could be fed in, while, owing to their shape, the grenades themselves ranged well.

Fig. 1.

The first form of catapult to become a regulation weapon in the British army in France was the "Leach," used in 1915-6. This was a strong forked wooden frame (fig. 1) about 7 ft. in length from front to rear, the width at the splayed end or fork being about 1 ft. 10 in. Near the ends of the forked arms or "horns" were attached two sets of powerful rubbers, the rubbers of each set being firmly bound together at the extremities. The inner ends of these sets of rubbers were attached to the pouch or bomb receptacle of the catapult, which, when the rubbers were out of tension (and the pouch therefore in its forward position), was about 1 ft. 9 in. from the front of the fork. When, in order to fire, the rubbers were pulled back to extreme tension the pouch was less than a foot from the tail end of the frame. This pulling back was effected by a wire attached to the rear of the pocket, which passed round a pulley on the tail of a gear-box on the underside of the frame. This gear-box contained a winding-handle, gear, and a retaining-pawl; when the handle was turned, the wire was drawn into the gear-box (the pawl preventing its unwinding) and the rubbers extended. A bomb was then placed in the pouch, and on the word or signal to fire a trigger release broke the connexion between the pouch and the wire, and the rubbers, reasserting themselves violently, propelled the bomb.

With a heavy type of grenade weighing 1 lb. the Leach catapult was capable with new rubbers of a range of 200 yd., and like other bombthrowers it possessed the important advantage, as against trench mortars, of invisibility and silence in action. The main disadvantage, the rapid wear of the rubbers, could be overcome by the frequent issue of replacements, the rubbers being regarded as "consumable" stores. There was, however, a limit to the practical usefulness of this cheap and efficient weapon. Its ranging powers were unnecessarily great for grenade work proper and not great enough for the tasks which came to be assigned to the bombthrower. Accordingly, a lighter and more portable weapon of the same type was designed later by Capt. G. H. Wicks of the British Trench Warfare Department. This was easily portable and manageable by two men, and ranged, with the 1 lb. bomb, to about 100 yds. It was, however, not used in the field, as the line had by that time (1916) been drawn clearly between trench-ordnance projectiles and grenades. The heavy 1½ lb. - 2 lb. grenade having ceased to exist, the necessity for a weapon to propel it ceased also.

The catapult of the French army, known as the "Sauterelle," was smaller and more portable, but correspondingly less powerful, than the Leach. It was a magnified crossbow, acting by the reassertion of springs bent in cocking.
round a pivot situated at the front end of the platform, and clamping it when on the desired line.

The grenade as such is dealt with under Grenade while this article is concerned only with its tail. This is a hollow tube, fitting over the firing-peg, and having at the inner end of the cavity a propellant charge contained in either a service rifle cartridge (with the bullet removed) or else a capsule with a percussion cap. The interior of the firing-peg is formed in somewhat the same way as the interior of a rifle-bolt, that is, it carries a striker, striker-rod and striker-spring which are controlled by a trigger. On the right side is a cocking-lever by which the striker-rod is forced back against its spring till the notch formed on it is engaged by the sear of the trigger. When the

grenade, with its propellant cartridge or capsule, is placed on the peg and the safety pin of its fuze withdrawn, the trigger lanyard is pulled, the sear frees the striker rod, which is impelled forward by its spring and fires the cartridge cap, exactly as in a rifle. Until 1918 this weapon used only simple H.E. bombs. In that year a second type was introduced in which a small propellant charge in the head of the bomb was fired on impact with the ground, causing it to rebound and so to burst in air instead of burying itself. The ordinary (1915 model) grenade weighed 1.85 kgm. (4 lb.) and had a range of about 250 yards. The bouncing bomb was heavier (2.5 kgm. 5.5 lb.) and ranged only to 275 yards.

BOMBTHROWERS, NAVAL: see ORDNANCE.

BOONE, MUIRHEAD (1876-1940), British etcher and painter, was born at Glasgow in 1876. He was educated at Glasgow, afterwards studying in the school of art in that city, and in 1897 and the following years produced some excellent work in black and white for the Scots Pictorial. He established himself in London in 1901, where he quickly made a reputation by his etchings. He was elected to the New English Art Club, and was prominent in founding the Society of Twelve. In 1906 his etching "The Great Gantry, Charing Cross," was bought by the National Art Collections Fund and presented to the British Museum. During the World War his services were enlisted by the British War Office for the production of pictures of the western front, and some of these were subsequently reproduced in volume form.

BONI, GIACOMO (1839-1922), Italian archaeologist, was born at Venice April 25, 1839 and educated in Venice, Pisa and in Austria and Germany largely by making student journeys through the provinces of the ancient Roman Empire. He became successively superintendent of the architectural school of the Royal Academy of Venice, inspector of antiquities under the Ministry of Public Instruction, commissioner for the monuments of Rome, and, in especial, director of the excavations in the Roman Forum and on the Palatine Hill, begun in 1890 (see 23, 250 of seq.). These he has described in numerous reports, and he has also published a report on the campanile of St. Mark's at Venice, which was rebuilt under his direction and completed in 1910. He was given honorary degrees by both Oxford and Cambridge, and is a member of the Superior Council of Antiquities and Fine Arts for the kingdom of Italy. In 1918 he unearthed on the Palatine Hill a Greek marble statue of Victory dating back to the 5th century B.C. Besides his reports on Roman antiquities he published Hibernica, notes on burial places and customs of ancient Ireland (Eng. trans. 1906).

BOOTH, BRAMWELL (1850-1922), British businessman, was born at Nottingham June 2, 1850. He started a retail chemist's business in a small way in that town, but gradually extended it until branches were established, with factories in connexion, in most of the towns in the United Kingdom. He became chairman of Booth's Pure Drug Co., Ltd., and also of Booth's Cash Chemists, Ltd., which later added lending libraries and departments for the sale of fancy goods to the various chemist's shops under their control. In 1920 he sold the whole of his business to the United Drug Co. of America, under whose control a new company was formed with the title Liggett's International, Ltd., for the purpose of taking over other drug concerns in England and Canada. In 1921 he formed Sir Jesse Booth's Social Trust, Ltd., a registered company with nominal capital £50,000 in 10,000 £5 shares, to find out "by investigation the best means of removing or alleviating poverty, distress, and other social evils, and promoting social service." He became its chairman and governing director, his wife and Mr. J. W. Briggs, secretary of the Notts. C.O.S., being the other directors. He received a knighthood in 1909 and a baronetcy in 1916.

BOOTH, WILLIAM (1839-1912), "General" and founder of the Salvation Army (see 4:239). Towards the close of his life he became blind through cataract, losing the sight of one eye in 1909, and of the other, after an operation, three months before his death. But he had continued to direct the operations of the Salvation Army, and learned to write without the aid of sight. As late as 1909 he had undertaken his sixth motor-car campaign. His last public appearance was made at the Albert Hall, London, May 9, 1912, at a meeting to celebrate his 83rd birthday. His intense faith, profound and tireless sympathy, and disinterested devotion, had won for "General" Booth a unique place in the social and religious world. In the early nineties of the 19th century he might have passed away simply as the fanatical hot-gospeller of a new sect of street-corner psalm-singers; it would have been incredible then that he should end his life as one for whom Westminster Abbey was seriously suggested as an appropriate resting-place, one of the autocrats of the religious world, the creator of a world-wide organization of social service.

His son, William Bramwell Booth (b. 1856), was chief-of-staff to the Salvation Army from 1880 to 1912, and succeeded his father as "general" in 1912. His wife, whom he married in 1882, had been commissioner and leader of the women's social work of the Salvation Army in the United Kingdom since 1884. In 1920 she was made J.P. for the County of London, and in 1921 was elected one of the visiting justices for Holloway prison, where women convicts are confined.

BORAH, WILLIAM EDGAR (1856-1931), American politician, was born at Fairfield, Ill., June 29, 1856. He studied at the Enfield, Ill., Academy and entered the university of Kansas with the class of 1889, but did not finish his course. He was
admitted to the bar in 1859, practised at Lyons, Kansas, 1892-1, and thereafter at Boise, Idaho. He was an unsuccessful candidate for the U.S. Senate in 1902, but was elected in 1907 and again in 1913 and 1915. At the time of the split in the Republican party in 1912 he opposed the nomination of President Taft but refused to bolt and follow Roosevelt, although in sympathy with his policies. In 1913 he was a vigorous opponent of Secretary Bryan's proposal to create a U.S. protectorate over Nicaragua. The same year he introduced an unsuccessful bill for raising the income tax exemption to $3,000. He had long favoured a Federal levy on incomes but thought that with the then existing system of indirect taxation the additional burden should fall upon the well-to-do. He favoured woman suffrage and independence of the Philippines, but his chief opponents were those who were opposed on the ground that it tended toward internationalism. He strongly opposed many of the measures of President Wilson's administration, and in particular the League of Nations, against which, as a delegate-at-large from his state, he was an effective speaker at the Republican National Convention of 1920.

**Borden, Sir Frederick William** (1837-1917), Canadian statesman (see 4.245), failed to secure reélection to the Dominion Parliament in 1911 and retired from politics. He had been created K.C.M.G. in 1904 on the occasion of the coronation of Edward VII. He died in 1917.

**Borden, Sir Robert Laird** (1854-), Canadian statesman (see 4.245), became leader of the Conservative Opposition in the Canadian House of Commons in Feb. 1901, on the resignation of Sir Charles Tupper. This position he held until 1911, when the Laurier Administration was defeated on the Taft-Fielding Reciprocity Compact with the United States; he was then called upon to form in Oct. 1911 a new administration and was sworn of the Privy Council Jan. 1, 1912, taking office as president of the King's Privy Council of Canada in the new Cabinet. For the purpose of more effectively carrying on Canada's part in the World War he formed, in Oct. 1917, a Union Government, comprising members of both the Liberal and Conservative parties in which he took office as Secretary of State for External Affairs. The Union Government was returned to power in the general election of Dec. 17, 1917. Borden was a member of the Imperial War Cabinet and Imperial War Conference 1917-8 held in London, England, but owing to ill health resigned the premiership in 1919. He was created G.C.M.G. in 1914.

**Borglum, Solon Hannibal** (1868-), American sculptor, was born in Idaho, March 25, 1868. His father was a physician who emigrated from Denmark in 1864. He was educated at St. Mary's College, Kansas, and studied art at the school of the San Francisco (Cal.) Art Association, and during 1890-3 attended the Académie Julian and the École des Beaux Arts in Paris. He then returned to America for a year, but in 1896 went to London, and during the next five years exhibited much sculpture and painting there and in Paris. In 1902 he moved his studio to New York. In 1904 he received a gold medal for sculpture at the St. Louis Exposition. He was a member of numerous organizations, including the Royal Society of British Artists and the Société Nationale des Beaux Arts, France. He was a disciple of Rodin and a leader of the insurGENCY in America. His theory of representing history by sculpture is thoroughly in accord with that of ancient Greece. The huge scale of many of his conceptions can be compared only with that of ancient Oriental monuments. For example, he proposed a Confederate memorial on Stone Mt. near Atlanta, Ga., to be cut in relief along the face of that granite mountain as a frieze representing an army on the march, conspicuous from a great distance. In 1919 he exhibited a head of Lincoln cut from a block weighing six tons. The same year he was chosen to design a monument for Warsaw, commemorating the rebirth of Poland. Among his colossal figures are the Twelve Apostles for the cathedral of St. John the Divine, in New York, and another head of Lincoln in the rotunda of the Capitol at Washington. Other works include the Sheridan monument in Washington; "Mares of Diomedes" and "Ruskin" in the Metropolitan Museum of Art, New York; statue of Lincoln, Newark, N.J.; statue of Henry Ward Beecher, Brooklyn; the Wyatt Memorial, Raleigh, N.C.; "The Flyer" at the university of Virginia; gargoyles for a Princeton dormitory; "Wondertainment of Motherhood" and "Conception."

**Borglum, Solon Hannibal** (1868- ), American sculptor, brother of the foregoing, completed many important statues after 1910, including "God's Command to Retreat" (1911, Napoleon on horseback in a snow drift, bronze); "Jacob Leisler," first governor of New Amsterdam (1911, heroic figure in bronze at New Rochelle, N.Y.); "Reverie of a Pioneer" (colossal equestrian for the Court of Honour, San Francisco Exposition); "Backin' Em Up" (1919, four dismounted cavalrymen on horseback); "The Dew" (unveiled 1920 in the churchyard of St. Mark's in the Bowery, New York City); "Inspiration" and "Aspiration" (1920, two statues of Indians, in stone, both at St. Mark's in the Bowery). He was Y.M.C.A. secretary with the French army in 1918, won the Croix de Guerre, and later was engaged in educational work with the A.E.F. in France.

**Boris III.** (1894- ), King of Bulgaria, eldest son of King Ferdinand (see 10.269) and of Marie Louise de Bourbon, eldest daughter of Duke Robert of Parma, was born at Sofia, Jan. 30, 1894. Although his parents were Roman Catholics, the prince was, on Feb. 14, 1916, received into the Orthodox church, the Tsar Nicholas II. being his god-father. He was educated entirely in Bulgaria, first by tutors and later at the cadet and officers' schools, serving subsequently as A.D.C. to the King and to various generals. On the abdication of King Ferdinand, immediately after the Armistice which put an end to Bulgaria's disastrous share in the World War, Boris succeeded his father, Oct. 4, 1918.

**Bornet, Jean Baptiste Edouard** (1832-1911), French botanist, was born at Guernicy Sept. 2, 1832. Details of his special work on algae and lichens will be found in 1:593, 16.578 and 16.579. He was a member of the Académie des Sciences in 1886 and received the gold medal of the Linnean Society in 1891. He died in Paris Dec. 17, 1911.

**Boreoevic von Bojna, Svetozar** (1856-1920), Austro-Hungarian field-marshal, was born at Umetic in Croatia. As a young officer of infantry he served through the campaign for the occupation of Bosnia in 1878, and afterwards on the general staff until he reached the rank of general. In the World War he first led the VI. Corps in the victorious battle of Komarow, and as commander of the 3rd Army brought the Russian attacks in the Carpathians until May 1915. He then took over the command of the Isonzo. His name is forever associated with the 11 victorious battles fought in the defence against Italian armies twice as numerous as the Austrians and considerably better equipped. After the collapse of the monarchy the Yugoslav Government refused the "black and yellow" general permission to return to his province.

Boreoevic embodies the type of the Croat general of the past in the more polished mould of the present. By iron industry he had acquired the fullest mastery of the science of war, as a general in the field he was distinguished by his intuitive judgment of the enemy, by his tenacious energy, and by his ingenuity as a tactician.

**Bosanquet, Bernard** (1858- ), English philosopher, was born at Rock, near Alnwick, June 14, 1858. Educated at Harrow and Balliol College, Oxford, he was for ten years a lecturer at University College, Oxford (1871-81). In 1881 he came to London, and until 1897 engaged in lecturing and social work. He married in 1895 Helen Denly, herself the author of books on social problems. During 1903-8 he was professor of moral philosophy at St. Andrew's University. He became a fellow of the British Academy. A Hegelian in philosophy and a disciple of T. H. Green, his logical tenets are described in 16.836, 898 and 917.

Amongst his published works are Knowledge and Reality (1885); Logic, or the Morphology of Knowledge (1888); Essentials of Logic
BOSNIA-HERZEGOVINA (see 4.270).—Until Oct. 1912 Bosnia-Herzegovina remained a territory of the Austro-Hungarian Empire. A proclamation issued on the occasion of its annexation to the Habsburg Monarchy in 1906 promised these lands constitutional institutions, which should secure to their inhabitants full civil rights and a share in the management of their own affairs by means of a local representative assembly. In performance of this promise a constitution was promulgated on Feb. 10 1910. This included a Territorial Statute (Landsstatut) with the setting up of a Territorial Diet, regulations for the election and procedure of the Diet, a law of associations, a law of public meetings, and a law dealing with the district councils (Bezirksräte).

According to this statute Bosnia-Herzegovina formed a single administrative territory under the responsible direction and supervision of the Ministry of Finance of the Dual Monarchy in Vienna. The administration of the country, together with the carrying out of the laws, devolved upon the Territorial Government in Sarajevo, which was subordinate and responsible to the Common Ministry of Finance. The existing judicial and administrative authorities of the Territory retained their previous organization and functions. The statute guaranteed generally the civil rights of the inhabitants of the Territory, namely citizenship, personal liberty, protection by the competent judicial authorities, liberty of creed and conscience, preservation of the national individuality and language, freedom of speech, freedom of learning and education, inviolability of the domicile, secrecy of posts and telegraphs, inviolability of property, the right of petition, and finally the right of holding meetings.

The Diet (Sabor) set up consisted of a single Chamber, elected on the principle of the representation of interests. It numbered 92 members. Of these 20 consisted of representatives of all the religious confessions, the president of the Supreme Court, the president of the Chamber of Advocates, the president of the Chamber of Commerce, and the mayor of Sarajevo. In addition to these were 72 deputies, elected by three curiae or electoral groups. The first curia included the large landowners, the highest taxpayers, and people who had reached a certain status in life. The second curia consisted of people who paid their own way in taxes. To the second curia belonged inhabitants of the towns not qualified to vote in the first; to the third, country dwellers disqualified in the same way. With this curial system was combined the grouping of the mandates and of the electors according to the three dominant creeds (Catholic, Serbian Orthodox, Moslem). To the adherents of other creeds the right was conceded of voting with one or other of the religious electoral bodies within the curia to which they belonged.

All males 24 years of age, and natives and residing in the Territory, possessed the franchise, as also Austrian and Hungarian citizens engaged as officials in the administration and on the railways in Bosnia-Herzegovina. Qualifications for election as deputy were the same as for the franchise, save that the minimum age limit was fixed at 30, and public officials and teachers were excluded. The law on district councils created a district council (Bezirksrat) for every district (Bezirk) to take part in the administration of local public affairs.

The Diet.—On June 25 1910 the first session of the Diet of Bosnia-Herzegovina was opened. Shortly before this the Emperor Francis Joseph had visited the country for the first time, and had met with an enthusiastic reception. The Diet was composed of three great religious parties, the strongest of that of the Serbs (Orthodox), the next that of the Moslems (Mahomedan), and lastly that of the Croats (Catholics). Each of these parties struggled for the hegemony, but since none commanded a majority, efforts at coalition began among the three groups. The opposition between Serbs and Croats, which had come more sharply into evidence after the annexation, had become softened, and all three parties combined in a demand for far-reaching autonomy. The constitution had not contented the political parties, since it did not satisfy the desire in the country for full self-government. The Government had not a strong majority on the opening of the Diet, but under the favourable impression produced by the Emperor's visit, the first budget laid before the Diet was approved even by the opposition groups, and in this the Government saw also a kind of vote of indemnity for their administration in pre-constitutional times. The Diet started a fruitful activity, and the Government was able to secure a majority, consisting of Croats, Moslems and moderate Serbs.

In the spring of 1911, during the discussion of the Road Construction Bill, the language question for the first time led to quarrels in the Diet in connexion with the notices on signposts; throughout the year party wrangles, discontent with the constitution, and the obstructive tactics of the radical Serbs hampered business; and the Government no longer had a certain majority. Early in 1912 the Austro-Hungarian Minister of Finance, Baron Burian—the author of the Bosnian constitution—resigned office, and was succeeded by Ritter Leo von Bilinski. To the new minister the representatives of the various parties in the Diet presented a memorandum asking for a revision of the constitution and of the rules of procedure in the Diet; for an alteration of the electoral law; for a Government responsible to the Diet and at least partly recruited from among its members; for an extension of the sphere of activity of the Territorial Government in political and economic matters; for an independent policy of railway rates, the appointment of an audit office for the financial control of the Government, and the regulation of the language to be used by officials and functionaries. The object for which the parties were striving became more and more evident: the greatest possible autonomy for the Territory of Bosnia-Herzegovina and independence of the central Government of Vienna. With the rejection of the budget of 1912 began an open conflict between the Government and the parties in the Diet, which had as its result a long pause in the activity of the Diet.

After wearisome negotiations and the acceptance by the Government of a series of the demands set forth in the memorandum, a combination of Croats, Moslems and moderate Serbs, in a working majority, was arrived at during the summer of 1912, under which conditions the third session of the Diet was opened on Oct. 7 1912. The new Government succeeded in obtaining the indemnity for the 1912 budget, and passed through the Diet a great number of the laws which it had drafted. New difficulties cropped up in the discussions of the proposed law on the language question. The draft law specified Serbo-Croatian as the future official language in all affairs, both internal and external, connected with the civil administration, with public educational establishments, and State railways so far as their external traffic was concerned. The parties also demanded Serbo-Croatian as the official language of the railways in Bosnia-Herzegovina itself; but this the Government refused to concede; and, since no agreement could be reached, the Diet was prorogued, and the fourth session was not opened until Dec. 20 1913.

For this session the Government had managed to secure a working majority consisting of Croats, Moslems and moderate Serbs. The language law and several other important measures were passed. A resolution was also carried in support of a law drafted by the Government with a view to a solution of the agrarian question which should do equal justice to the interests of the landlords and the Khants (see AGRARIAN QUESTION p. 474). The business of the Diet was suddenly interrupted by the assassination of the Archduke Francis Ferdinand at Sarajevo on June 28 1914. The session was closed on July 9, and on Feb. 5 1915 the Diet was dissolved. Owing to later political developments, ending with the break-up of the Austro-Hungarian Monarchy, there were no new elections. In spite of political obstacles the Diet had done much towards the development of the constitution, and during its four sessions had framed

(1895) *Psychology of the Moral Self* (1897); *Principles of Individuality* (1911); *What Religion Is* (1920) as well as translations of Hegel and Lotze.
numerous laws, many of which were important. Their discussion was generally conducted on a notably high plane and bore witness to a thorough and many-sided examination of the matters requiring consideration.

Administration.—According to the census of 1910 the pop. of Bosnia-Herzegovina was 2,989,195, of whom 52.4% were males and 47.6% females. As compared with the year 1895 the population showed an increase of 21%. The civil pop. of the capital, Sarajevo, had risen from 38,600 to 51,900 persons. According to the census of the population was divided as follows:

<table>
<thead>
<tr>
<th>Year</th>
<th>Sex</th>
<th>Population</th>
</tr>
</thead>
<tbody>
<tr>
<td>1895</td>
<td>Male</td>
<td>1,635,406</td>
</tr>
<tr>
<td>1895</td>
<td>Female</td>
<td>1,353,790</td>
</tr>
</tbody>
</table>

The remainder was composed of other religious creeds. According to occupation the figures were:

<table>
<thead>
<tr>
<th>Occupation</th>
<th>Persons</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agriculture</td>
<td>87%</td>
</tr>
<tr>
<td>Industry</td>
<td>5%</td>
</tr>
<tr>
<td>Trade and Commerce</td>
<td>2%</td>
</tr>
<tr>
<td>and in the public service and liberal professions in round numbers</td>
<td>2%</td>
</tr>
</tbody>
</table>

Of the whole pop. from the age of seven upwards 87.8% were illiterate. The part taken in the public service by the indigenous element was on the increase (in 1908, 31%; in 1910, 44.5% of all public officials).

Pupils of the secondary schools in Bosnia-Herzegovina who passed on to universities or other higher educational institutions of the monarchy, on their return entered the Government service or the liberal professions.

The number of public schools in Bosnia-Herzegovina during the period 1910-1914 and its highest figures were:

1. In 1910 there were 9,658 schools, 4 higher elementary girls' schools, 3 training colleges for male and female teachers, 9 trade schools, 1 commercial academy, 2 technical schools, 1 special technical school, 4 grammar schools (Gymnasium), 1 Realschule, and 1 military lower Realschule, 3 theological colleges.

2. In addition to these there were numerous denominational and private educational institutions, Turkish minorities, and modernizers (lower and upper Moslem schools) and three private grammar schools. In 1911 the Diet unanimously decided upon compulsory school attendance for four years for children over seven years of age. In 1883 the Landesmuonts were founded, and provided with a modern building in 1912. It contains collections of scientific, artistic and historical interest. In 1912 was established the Bosnian and Herzegovinan Institute for research connected with the Balkan Peninsula. Worth attention are the Wissenschaftliche Mitteilungen aus Bosnien and Herzegovina, published by the Museum, of which the 13th and last volume appeared in 1916.

The Press underwent a rapid development. In 1914 there appeared 43 periodicals, six of which were daily papers, three weeklies, and 30 monthlies. Of these 38 were published in the Serbo-Croatian, two in German, and the rest in both languages. There was also a great increase in other societies, which in 1910 numbered 833 with 102,000 members, one-third of them being Serbs.

The Agrarian Question.—Shortly before the opening of the Diet in 1910 a strong agitation had begun among the Kmeti, i.e., peasants holding land, but not under mortgage. In some cases, by personal services in addition (see 4.286). In 1911 the Diet unanimously passed a law for the conversion of these tenancies into freeholds by voluntary agreement between landlords and tenants. For the present the Government was empowered to issue bonds (Kmetenlösungsbürgschaften), and a special office (Kmetenlösungsbürgschaftamt), akin to the Irish Land Commission, was established at Sarajevo to carry out the law. The process of redemption now proceeded rapidly. Whereas during the 33 years (1879-1911) 32,681 Kmet tenancies had been converted into freeholds at a cost of 20 million kronen, 13,571 were converted between June 1911 and the end of 1915. According to the calculations of the Sarajevo office, redemption in this form, which proceeded without friction and had no unfavourable influence on the existing agrarian situation, would have been completed within 20 years.

The year 1913 a new military service law came into force in Bosnia-Herzegovina, by which the liability for military service was put on the same footing as that in Austria-Hungary. The National Oak was not introduced into Bosnia-Herzegovina, but in its place the 2nd and 3rd Reserves were formed. Liability for military service began with the completion of the 19th year of age, and ended in the year in which the man liable for service completed its 60th year. By a law of 1912 the number of military hospitals was modified to make the liability for service for the duration of the war extend from the end of the 18th to the end of the 50th year of age. The military establishment for Bosnia-Herzegovina comprised four military districts, one Feldjägerpflicht and one Feldjägerkompanie.

Public Health.—In the field of public health the Diet decreed in 1914 the extension of the Territorial hospital in Sarajevo, and the erection of hospitals in the towns of Breza, Breza, Banjaluka, Ugljevik, and Maslovci which were provided for an average of 800,000 to 1,600,000 kronen yearly. Of these mines Maslovci was newly opened in 1917.

In the industry the production of iron ore is rich. From 1891 onwards Vareš had already been occupied in the production of ore and its conversion into pig-iron and other foundry products, but the working of the great ore deposits of Ljubija near Pyriješor was only begun during World War I, when the output of thenecessary coal (700,000 tons) undertaken. The works can cope with a daily production and transport of 300 waggonloads of ore. The deposits consist of a Thierry grade ore iron showing a proportion of 50 to 58% iron.

In 1912 a Geological Institute was set up, the most important task undertaken by which was the construction of a new geological map of Bosnia and Herzegovina. The general map planned to consist of 26 maps covering 800,000, and in 1921 the sections Sarajevo and Tuzla had been issued.

In the chemical and other industries existing in 1910-18 were:

1. Alkali factory, one carbohydride and one lime factory, one salt distillery, one cellulose factory, one petroleum refinery, and one alcohol distillery, several breweries, a sugar factory and, finally, four tobacco factories.

2. In 1914 the production of workmen compulsory sickness insurance was introduced in 1910, and preparations were completed for legislation as to compulsory accident insurance for workmen. An industrial inspector had already been appointed before this.
Finance and Trade.—Numerous new credit institutions were at the disposal of the economy of Bosnia and Herzegovina. The Austro-Hungarian Bank set up three branch establishments in the country, and in addition 15 new credit institutions were founded, among them the Serbian and Moslem Central Bank which, together with the Croatian Central Bank, which was founded earlier, represent native capital. In 1910 a Post Office Savings Bank was set up. The chief statistics of foreign trade were published annually by the statistical department. The last publication appeared in 1913:— Imports: 466,000 tons of goods and 40,000 head of cattle (in round figures). Exports: 1,090,000 tons of goods, and 207,000 head of cattle. The total turnover of foreign trade in 1913 amounted to 338 million kronen, 39.2% of which represented imports and 48.8% exports. The export and import of goods in the years 1910-3 amounted to the following:—

<table>
<thead>
<tr>
<th>Year</th>
<th>Tons</th>
<th>Mill. Kr.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1910</td>
<td>393,800</td>
<td>1,445</td>
</tr>
<tr>
<td>1911</td>
<td>352,800</td>
<td>154</td>
</tr>
<tr>
<td>1912</td>
<td>392,000</td>
<td>174</td>
</tr>
<tr>
<td>1913</td>
<td>460,600</td>
<td>200-7</td>
</tr>
</tbody>
</table>

The costs were estimated at 270 million kronen. For payment of the interest and sinking-fund on this loan Austria and Hungary pledged themselves to pay a yearly contribution of 10 million kronen for 60 years. Of these projected lines construction was begun in 1914 on the sections Banja-Luka–Jajce, Samac–Doboj, Bugojno–Arzano, Bugojno–Rama, Brcko–Tuzla–Bjeljina. The war cut short of completion these lines. The construction of the section Niv–Bihać was begun in 1914 and continued during the war.

Manufactures.—The following table shows the value of products and of materials and the amount paid in wages in the years 1909, 1913 and 1918:—

<table>
<thead>
<tr>
<th>Year</th>
<th>Value of Products</th>
<th>Value of Materials used</th>
<th>Wages paid</th>
</tr>
</thead>
<tbody>
<tr>
<td>1909</td>
<td>$51,593,337</td>
<td>$283,345,602</td>
<td>$93,125,349</td>

<tr>
<td>1914</td>
<td>$84,115,582</td>
<td>$333,435,579</td>
<td>107,759,932</td>
</tr>
<tr>
<td>1918</td>
<td>$1,270,895,592</td>
<td>$2,846,000,000</td>
<td>3,105,000,000</td>
</tr>
</tbody>
</table>

First in importance among manufactures is outerwear $216,302,440 (leather boots and shoes $108,515,715, boot and shoe cut stock $70,105,251, and rubber boots and shoes $44,175,483). Next in importance are: slaughtering $85,647,504, machinery and foundry products $91,153,767, printing and publishing $51,191,023, men’s and women’s clothing $1,167,694, confectionery $37,988,668. These are the industries in which growth has been most rapid, but not rapid enough to overcome the slowing down as compared with other industrial centres. The increase in value of produce due to the World War in the years 1914–5 was rapid, but did little more than keep pace with the increase in prices. The total increase in the number of persons thus employed from 1913, before the war, to 1918, the period of highest production under war pressure, was 20,113, following which, however, a large number of employees was laid off. With immigration of foreign workers, the constricted industrial opportunities have caused increasing numbers of native born to move away from Boston. The actual increases in population have been largely in the ranks of the immigrant peoples, 35% of the inhabitants of municipal Boston being in 1918 foreign born (24% of them Irish, 17 Education, 16% public-school system) of German, 35% all other nationalities). Of the municipal pop. in 1915, 72% was wholly or in part of foreign parentage.

Railways.—During the 10 years 1910–20 the railway system was enlarged. The Hylton addition from Arlington to Kenmore street (1911–4) and the extension under the Common over the Charles river basin and underground in Cambridge to Harvard square (1914–5) developed a system 9.1 miles long, at a cost of $36,650,000. The new railways with the elevated system have given central clearance and ease of transfer throughout the district. The cities and towns have permitted several of their interurban lines to be absorbed, and many of their lines to go into disrepair, but the motor transport service by private initiative has been greatly increased. The second transportation requirement—the need for equipment to keep in touch with outside traffic—has not been met by Boston. Boston has failed to provide adequate terminal and storage facilities; and it is connected in its railway service. There are three railway systems that look to Boston for clearance and outlet: the Boston & Maine, the Boston & Albany, and the New York, New Haven & Hartford. But the lack of facilities for transfer from one system to another makes Boston virtually three ports instead of one—competitors with each other instead of with outside ports. The cities to the north (as Lowell, Lawrence, etc., only a few miles from Boston) often find it of advantage to ship via New York. The same is true for freight originating on each of the three systems.

—The public-school system is under state guidance and patronage (see MASSACHUSETTS). The growing interest in higher education is reflected in the table below. It is significant that...
The trend of higher education has been toward increasing opportunity for the masses. This is shown not alone by the increasing number of full-time college students, but also by the rapid growth in the number taking part in “University Extension Classes.” In Harvard, for example, the number taking these courses increased 96% from 1910 to 1920; in Boston University, 185%; under the direction of the State Department of Education the number increased from 1,360 in 1916 to 24,231 in 1920, nearly one-half of these students being registered in metropolitan Boston. The estimated number for 1921 was 30,000.

The Municipal Boston in 1920 had 264 permanent and 173 portable school houses, besides 21 rented quarters for schoolroom use; providing 1,036 school and 66 school halls; and employed 3,411 teachers; 97 assembly halls and 15 drill halls and gymnasium. It had 52 park and 32 schoolyard playgrounds; employed 153 recreation teachers, 46 school physicians, 48 school nurses, and 25 attendance officers. In 1919 it registered 123,452 everyday school pupils; 8,260 in evening schools and 9,051 in continuation schools. The registration in normal, high and Latin schools for the same year was 17,018. Of the pupils 82.6% were in public schools, and 17.4% in private schools.

Buildings, Libraries and Museums.—In 1912 the old Museum of Fine Arts was demolished and on the site was erected the Copley Plaza Hotel, built at a cost of $3,800,000 and opened in 1911. The new building of the Museum of Fine Arts, erected on Huntington Ave., was opened Nov. 15, 1909, and a second section opened Feb. 3, 1915, the total cost at that time being $3,900,000. To the State House east and west wings were added during 1915–9, at a cost approximating $8,000,000. John Sargent’s series of panels in the public library was practically completed in 1916, when he added a third sequence, the “Theme of the Madonna.” In Jan. 1910 the public library contained 1,107,498 volumes (222,348 in Jan. 1908). It is to be the largest free public library in the world with a circulation of 3,200,000–732 for 1919 (1,559,114 for 1907). The New England Conservatory of Music remained the largest in the United States, having in 1919, 3,700 students. The Boston Opera House was erected on Huntington Ave. in 1909.

History and Finance.—Boston, as a metropolitan district, has retained much of the institutional structure of the old towns which have grown together and became consolidated for certain purposes by legislation. Several things have happened in the 10 years 1910–20 indicating a drift toward political unification. What was called the “Boston 1915” movement reflected in better business leadership, in more ample support given to the chamber of commerce and other trade bodies; and legislation looking toward a united harbour place. A new charter adopted in 1909 gave to the city a small council (9 members) elected “at large.” In 1920, under the leadership of Mayor Peters, a first effort was made to consolidate the seven independent cities and towns under a “Greater Boston” charter. In many ways the whole metropolitan district had developed the habit of acting together, as was exemplified in the Liberty Loan and Victory Loan drives, the results of which were as follows: First Liberty Loan $337,700; second Liberty Loan $147,700; Third Liberty Loan $736,500; Fourth Liberty Loan $139,008,150; Victory Loan, $83,852,700; total amount subscribed $58,113,350. Boston’s per capita expenses continued to be the largest of any American city; but in the 10-year period ending in 1918 the net debt was $38,919,117. The net rate of the year ending in 1917 was $32,990,507; excluding payments on funded and floating debts. The running expenses per capita in 1917 were $3,168 (New York, $25,64; Chicago, $22,26).
Brownian movement of the particles (see Baylis, Principles of General Physiology, 1918). On the basis of the colloid theory of protoplasm, the living organism has been defined as a specific complex of dynamic changes occurring in a specific colloid substratum which is itself a product of such changes and which influences their course and character and is altered by them" (Child, Senescence and Regeneration, 1913).

Further investigation of the fundamental process of carbon dioxide assimilation has confirmed the work of F. F. Blackman and his school that the rate of photosynthesis is controlled by temperature, light intensity and concentration of carbon dioxide. Any one of these factors may control the rate of the process and so are "limiting factors". The amount of chlorophyll, since it controls to a large extent the amount of light absorbed, should also be a controlling factor, and Willstätter and Stoll (Untersuchungen über die Assimilation der Kohlensäure, 1918) have shown that this is so. With the help of the methods of extracting and estimating the leaf pigments developed earlier by Willstätter they have been able to relate chlorophyll content with rate of assimilation. Their observations have brought out the interesting fact of the importance of some unknown factor (possibly the "living factor" nature) which has been termed the protoplasmic factor. The existence of this factor is demonstrated by the observation that, relative to the amount of chlorophyll present, the assimilating activity of a yellowing leaf may be maintained at a high level. The existence of such a factor is also demonstrated by the observations of Miss Irving (Annals of Botany, 24, 805, 1910) and Briggs (Proc. Roy. Soc. B, 91, 1916). It is shown that the beginning of the chlorotic leaves chlorophyll appears some time before the process of assimilation begins. Osterhout (Jour. General Physiology, 1919) and Warburg (Biochem. Zeit., 100, 1910) have confirmed the high temperature coefficient of carbon assimilation by plants. The amount of carbon assimilation which was first demonstrated by Matthaei. This high temperature coefficient shows clearly the process of carbon assimilation is not a simple photosynthetic process but is linked with one or more "dark" reactions. Warburg was able to show that light, which was intermitted 16,000 times—the light and dark periods being of equal length—caused as much assimilation as continuous light. This enhanced intensity of light received intermittently by the plant was thus twice as effective as that received by continuous illumination. Reference must also be made to a work of great value, Jürgensen and Stiles' critical review of investigations of carbon assimilation up to the year 1917 (Jürgensen and Stiles Carbon Assimilation, 1917; originally published in the New Phytologist, 1916–7).

An important method of estimating assimilatory activity under natural conditions by following the growth of the leaf of the praying mantis, the whole plant was found to be the work of Gregory (Report Esper. & Res. Sta. Cheshunt, 1918), and subsequently by Briggs, Kidd and West (Annals of Applied Biology VI, 1919). In this work one of the leaves of the living cell is another aspect of plant physiology which has received much attention; but so many observers have studied the rate of entry or exit of substances, it cannot be said that great progress has been made in elucidating the processes of assimilation and transpiration. Measurements of electrical conductivity have been largely used for estimating the rate of passage of electrolytes in or out of the cell; and methods based on the rate of depauperization have also been employed and discussed (Researches of Blaauw, the sporangiospore of Pilobulus and the hypocotyl of Helianthus). By an ingenious arrangement of mirrors the plant was illuminated equally all round with electric light of various intensities. The rate of growth was measured every few minutes, and so it was determined that the "light growth reaction," as Blaauw terms it, is a very complex effect. With continuous light Phymyses shows a rate of growth 3 to 5 times, and then the rate of growth begins to fall. Moreover, the temperature of the light is increased by 5 to 7° C. under these conditions. The increase is followed by a fall and several rises and falls follow, the normal rate of growth being finally reached, except with very high intensities. A similar is the case with the Helianthus, but the main effect is a reduction of growth instead of an increase as in Phymyses. Blaauw explains photosynthetic effects as quite independent of light direction, holding that they are really due to the different intensity of the illumination of the two sides—as was shown by Candolle maintained long ago. The fact that both Phymyses and Helianthus show a positive phototropic reaction while the light growth reactions of the two are opposite in nature, is explained by the lens-like action of the glassy sporangiospore, which causes a higher light intensity on the further side. Bucler confirmed this explanation for he has shown that by placing the sporangiospores in paraffin oil, the lens effect is abolished. His paper brings out the light that the leaf, and that there is no such thing as a real phototropic reaction, but only a light growth reaction.

III. Chemistry of the Sap Pigments of Plants.—Flowers derive their tints from two very different classes of coloured compounds—plastid and sap pigments respectively. The former include chlorophyll, xanthophyll, carotenoid and allied compounds, and are not soluble in water. Chlorophyll enters into flower colourings, but compounds of the carotin and xanthophyll group are responsible for most of the bright yellow and orange flower colours, whilst in the presence of anthocyans they yield browns, bronzes, etc.

The sap pigments are water-soluble glucosides, and may in the main be subdivided into two groups. One group, the flavone and flavone glycosides, contains compounds which, though usually present in the cell sap of flowers, rarely give rise to colour effects as they are
pale yellow or colourless unless in the form of alkali salts. In certain cases a fraction of a % of a carotin colour may cover completely more than 20% of a flavonoid colour. The researches of A. G. Perkins and others have resulted in the isolation of a number of the flavones of this group, whilst the investigations of Kostanecki have led to their synthetic preparation.

Colours of the second group of sap pigments are called anthocyanins, (e.g., P. parasitica being termed anthocyanins; the non-flavonoid anthocyanins). They give rise to the red, purple and blue colours in flowers, and owing to their brilliant effects, have long been the subject of speculation and research. It is only recently, however, that their chemical nature has been disclosed. Willstätter and Everest obtained the pigment of the cornflower in a pure state, and proved that it exists in the flowers as a glucoside. They also showed that by change in the condition of the cell sap, one pigment may change into red, purple or blue colours: red in the presence of an acid cell sap, purple if the sap be neutral and blue if it contain the pigment in the form of an alkali salt. Indeed the same pigment (cyanin) has been isolated from red roses and from the blue cornflower. These observations have been extended by Willstätter and Mallison to show how the change in the pigments of the other groups is allowed for, and all varieties of flower colours can be explained. Shibata, Shibata and Kasigawa have recently put forward alternative suggestions to account for flower colours, but much of their experimental evidence has been shown by Everest to be untrustworthy. Other chemical work by Willstätter and by Everest has elucidated the chemical structure of anthocyanins pigments, has shown that they are products of the reduction of the flavonoids, and has led to their synthesis. The accompanying formulæ show how closely and how intimately related is the law flavonoids and anthocyanins. (I.) represents kaempferol, a flavonoid isolated by A. G. Perkins from a species of larkspur, and (II.) represents pelargonidin, which is the anthocyan pigment present in the flowers of various species of pelargonium.

A considerable number of these pigments has now been isolated in a pure condition. It is interesting to note that the honour of having first prepared crystals of these pigments outside the plants falls to the botanist H. Mölsch. Both in the yellow sap pigments and in the anthocyanins, the individual pigments only differ from other pigments of their own group in the number and position in the molecule of OH, methoxy, or sugar groups.

Beyond the two groups already given flavonoid and anthocyan pigment—have been demonstrated by chemical means, much botanical work had been carried out on this problem, notably by Whedale and others, whose long investigation confirmed views expressed many years previously that there was some definite connection between the yellow sap pigments and the anthocyanins. They also led to the belief that the anthocyan pigments were formed from flavonoids. This belief has been greatly strengthened by the proof of the close chemical relationship that exists between the two groups of pigments, and by the work of Everest, Willstätter and Combes, which proved that flavonoids could readily be converted into anthocyanins. Moreover Everest has shown that in all probability the anthocyan present in the Black Knight violet is accompanied by the flavonoid pigment from which it would be produced by reduction.

A new class of pigments, compounds has been found to exist in plants in the sugar free condition, but thus far only one anthocyan has been definitely proved to exist in the non-glucoside form—occurring in black grapes.

The chemical association related to that whilst many of the yellow sap pigments have long been used as mordant colours for commercial dyeing processes, and are still used to some extent in Europe and more in the East, the beautiful anthocyan pigments also have well marked dyeing properties, and can be converted into dyes of metaldants. In the non-glucoside condition they have affinity for metallic mordants, but owing to their lack of fastness in washing their use to any large extent is commercially impracticable.

(1917-9) in England, have been rapidly adding to our knowledge of this group of parasites.

Among the notable outbreaks of plant diseases which have occurred in recent years, rust, caused by the balsam woolly rust, or Alps wooly rust, has been particularly well known. This disease has been the subject of much study and national legislation, affecting export trade. In 1918 it appeared in the United States in miners' gardens among the coal-fields of Pennsylvania. The county of Lehigh has been surveyed and, when the period of incubation has been passed, a coordinated campaign has been started in America with an organization and vitality unknown in Europe, the results of which later years will reveal. In South Africa, Australia, and America the Citrus Rust (Pseudomonas citri), originally introduced on a plant from Japan, has swept through the citrus plantations with devastating results. In South Africa the canker eradication campaign up to 1919 had cost over £80,000. In the United States, although the rust (Cronartium ribicola) which was introduced from Europe about 1892, continued to make steady progress in the white pine regions of the eastern and central provinces, a few severe losses were reported. The following year a coordinated campaign by the State and agricultural organizations had been in progress, under which "scouts" and "State eradication crews" destroyed wholesale the species of Ribes which constitute the host of the fungus. The provisions of the State law against the introduction of any species of Pinus from Europe and Asia were enacted to prevent the carrying the white pine blister Rust; also, potatoes coming from many European countries were excluded in fear of "Wart disease." In 1910, the importation of all fungous seeds was prohibited and the introduction of plants into the United States except under special permissions. In this last South Africa has followed. In the United States, an Act to prevent fraud in the sale of fungicides and insecticides is now in the form of laborers used in the production of copper sulphate for spraying was legally guaranteed, further legislation to secure the purity of lime sulphur and arsenical washes has been proposed. In Germany, the War Trade Law of 1916, as well as the restrictions and the effect of the great war and the effect of the great war on agriculture, has been interpreter of plant diseases.

The decade ending in 1920 was rich in investigations bearing on the scientific control of plant diseases. Stimulated by the now classic discovery made by Biihen in 1907, that the inheritance of Rust disease is Mendelian, workers in Victoria, California, and many other countries (see Genetics) in many countries, e.g. Nilsson-Ehle, Biihen, Poinc, Evans, Stakman, Parker and Piemel, and Hayes, Parker and Kummell, have been engaged in the breeding of disease-resistant plants of different types. It has been found by Marsden and others that disease-resistant plants can be useful to the farmer, either by the resistance of the new varieties to the attack of many genera of economic plants. Varieties of beans and sugar-cane immune to "Mosaic disease" have been discovered (Reddick and Smith, 1912) and Craddock and others have been able to Colchicum and Tagetes to produce the disease. The disease was found by Barrus (1915) and used in crossing by Burnside (1915) and McRostie (1919); asparagus resistant to Rust (Norton, 1913), resistance to citrus canker (Feltier, 1918), will to fusarium (1911-19), and many other strains of rust disease in England, German, and American varieties, immune to "wart disease" (Maltheau, Snell et al.; Werth, 1919), Marlett (1919); potatoes immune to "blights" (Salman, 1910); cereals immune to fungus (Varley, 1912), Reed; hops immune to Sphaero- theca Humuli (Salmon, 1917-20).

Of great importance, scientifically, has been the chemical treatment of fungicides. The great work of Pickering (1907-19) in elucidating the chemistry of "Bordeaux mixture" profoundly affected the methods of planting, marketing, and curing. This has been accomplished by the researches of S. insect disease, and Metabolism of Hosts (1916) in iron, and Butler (1914-20) in America. Gimingham and Barker (1913) have made the use of fungicides in spraying trees for their biological explanation holds good for the efficacy of copper-containing fungicides on the sprayed plant.
for about an hour; in the other the soil is trenched in the usual way, but at the bottom of the trench is placed a grid made of iron piping perforated with holes through which steam is blown as soon as the soil has been replaced. The grid is then pulled out and placed in the next trench. The cost before the war was not less than £24 per acre, and in 1921 it varied according to the thoroughness of the steaming from about £30 to £300 per acre. In small nurseries or private glasshouses baking the soil is usually effective and is much cheaper, a coke oven being worked at very little cost. There is, however, a limit below which the cost cannot be brought, and in practice 12 tons or more of coke are needed to steam an acre of soil.

Attempts have therefore been made to find some chemical agent that will prove as effective as heat in dealing with undesirable organisms.

The method of investigation is to take each organism and find the toxicity of various chemical groupings. An example is as follows:

<table>
<thead>
<tr>
<th>Amount required to kill Wireworms.</th>

Proceeding in this way it is found that chlororesol and dichlororesol are very effective, and they are being studied on a large scale. Some complications arise from the fact that soil bacteria have remarkable powers of decomposing many poisonous substances such as carbolic acid, cresol, naphthalene, etc., and in some cases the decomposition proceeds so rapidly that the substance disappears before it has had proper time to act. This difficulty is being met by the introduction of a fresh lot of the material in successive years.

VI. Ecology.—In the domain of ecology the most important work since 1910 has been the intensive study of the habitat conditions in a number of limited areas. It is on such data alone that broad generalizations can be safely based, but much more needs to be accomplished in this direction before the significance of the results obtained can be rightly estimated. Of these intensive studies it is possible here to indicate only a few. Of the numerous types of plant communities that have been investigated, forests and woodlands have received a large share of attention and well illustrate the chief lines of progress.

Descriptive or primary survey work has elucidated interesting points respecting the courses of the altitudinal and polar tree limits. The meteorological conditions above and immediately below the timber line have been shown to exhibit an abrupt change associated with the cessation of shelter, but the gradual upward extension of the tree zone is limited by climatic conditions of which the duration of the snow-free period is the most important. In America and Switzerland the rise of the timber line has been noted as occurring at larger mountain masses and, as Brockmann-Jerosch has pointed out, the polar tree limit approaches the poles on the great continental land masses whilst it recedes from them in the oceanic regions of high latitudes. In other words, a continental climate is favourable to tree growth whilst an oceanic climate is unfavourable except at low latitudes. Modifications of the altitudinal timber line by soil and aspect have brought out the different demands and toleration of individual species. As a consequence of such changes the successive timber zones rise to a higher altitude on south exposures on stony soils without aspects not only are the zones lower but they may also be more numerous. In Switzerland, for example, successive zones of chestnut, beech and larch occur on slopes facing southwards whilst on northern slopes zones of silver fir and spruce become intermingled, the lower limit of the latter being apparently determined by the diminishing rainfall. The study of the biology and physiology of the constituent forest species has served to demonstrate the adaptive character of many of their salient features. The periodicity of the herbaceous vegetation is, for example, intimately related to that of the shrubs and trees above, the assimilation of the more specialized alpine herbs being carried on before the canopy of the latter is complete.

Again, it has been shown that the optimum assimilation of such plants is conditioned by the type of soil and the intensity of the root pressure, a factor which varies with the stage of leaf development and is intimately related to the humidity of the environment. This has been observed in the case of many species, even for the different parts of the same individual and in the different stages of development. Investigations of the soil conditions in relation to the plant covering have yielded promising results. Thus, the distribution of natural vegetation seems to be affected by the nature of the mineral as well as the organic components of the soil, the former being influenced by the acidity and deficiency of nitrates.

Another aspect of vegetation is the change to be observed when the environment is altered or the original plant covering removed. The investigation of such successional phenomena has already yielded important economic results in relation to the improvement of pasture. The work of W. G. Smith in Scotland, of Dr. L. Cockayne in New Zealand and Prof. J. W. Begg in South Africa, has drawn attention to the possibilities of artificial control of the natural succession. This principle is capable of wide-spread application wherever natural vegetation has an economic value; but it demands a practical knowledge of the vegetation and the soil conditions as the basis of classification and is exemplified by the system proposed by Gola in 1910 based on his theory of osmotic potential. The system is based on the assumption that the constituents of plant communities and with this are associated the names of Brockmann-Jerosch, Gams, Raunkiaer, Reuber and Warming. The third, associated with the American school, lays emphasis on the dominance of one or two species, and the development of the system is capable of modification as to accommodate the newly discovered facts. The work in this field is at present in the experimental stage, but it is certain that the results will be of great importance. The practical value of the developments in this field is already apparent in the new schools of thought and the new ideas that have been suggested. The theory of osmotic potential has at least one advantage over the older methods, in that it is based on an actual measurement of the potential of the solutions of the salts in the soil. This is a highly important advance in the study of soil nutrition and it is hoped that it will lead to a better understanding of the factors that determine the growth of plants.

The fourth regards floristic composition as of paramount importance and the work of Professor T. A. Rolleston is in this field.

The first two and the last tend to result in systems that are too artificial, whilst that of Clements demands a knowledge that we often do not possess and tends to destroy the phases which, though developing along divergent lines, are, regarded as plant communities, more closely related to one another than to the other phases of the same succession. Ecology is in much the same position as taxonomy in this respect. The days of a purely descriptive system are past, and the inadequacy of the knowledge to establish a natural system. Doubtless in time we shall find that, as with plant groups, different sets of characters must be used for different communities; but, in the meantime, it is to be hoped that the work of the various schools may be used as an inspiration for valuable research which is yielding that knowledge on which the classifications of the future must be based.

VII. Horticultural Exploration.—Botanical exploration in relation to horticulture centred during 1910-20, as in the preceding decade, in S.-E. Asia, particularly in western China. The gradual acquisition of British plantations has proceeded on a steady course, and the novelties from the East so far surpass in number, and in some
ways in interest, those from other regions as to warrant our speaking of this Chinese invasion as the dominant feature of plant introduction since the opening of the 20th century.

Explorers have discovered the richest relic of the Palearctic flora, its richness conditioned by an unique assemblage of deeply riverine, some mountain ranges traversed by three mighty rivers — the Indus, Mekong, and Yangtze — parallel north of the number of species; the number of species is between 1843 and 1921. It is of the fact that the fact that the autotrophic plant flagellate must be regarded as the precursor of all heterotrophic algae, fungi, and bacterial organisms in which the flagellated phase is still dominant or readily regained in reproductive stages implies that it is to the pelagic flagellates that one must look for conceptions of the origin of higher forms of plant life on this earth. As shown by Pascher (1917), the amoeboid habit may be attained secondarily, in connexion with available substratum, in any line of the phylogenetic tree. This seems to be the general rule, not only not that as we know it arose in the sea, but from the material of sea water, as the physico-chemical constitution of protoplasm suggests at the present day. Since no other factors than those of pelagic water and solar radiation are required to determine the physiological and structural response of such living zoids, a phase of continuous deep water over the entire world surface must have been present in the "plankton" organism. The cell unit, of which all higher life is composed, thus represents the same attainment in such an environment, established for all time with nuclear mechanism and faculty for division and fusion, as also all plant and animal organization.

It is to the sea that one must look for the incipient syntheses of early life, and the introduction of land or sea bottom within the sea. For long ages, the zois of the plankton, the attached plant or animal protoplasts, leads to a benthic phase of existence, and in the phylogenetic tree the autotrophic zoids it becomes possible to define the scope of allogogy. The cell soma becomes enlarged and multiple as it successfully solves the problem of nutrition by division, but indicates the tendency to surface older phase to a medium that is constantly renewed so long as the capacity for attachment is unimpaired. As opposed to the successful detachment of predatory animal organism (nektan), the detached autotrophic organism (plankton) seems to be the possible situation for the future. The algal soma thus follows the infinite series of compromises between maximum surface for nutrition and minimum exposure to mechanical stress, from quiet dark levels to illuminated surface-zones of rough water, giving rise to morphological differentiation of branching axes, growing points, lamination extension, and ultimately to massive highly differentiated shoot-systems with ramuli subserving attachment which come within the more popular conception of plant-form. In all such cases, however, exigencies of racial conditions imply a resumption at some period of the older planktonic soma, and in this phase phenomena of sexual fusion may be manifested. The reproduction of the soma gives rise to the wastage of protoplasts in regaining the sessile condition, on a substratum increasingly occupied in a violently agitated medium, may be brought under control. The development of algal form and function implies the possibility of autotrophic activity of the sexual and asexual reproductive mechanism. The latter implies that a cytological alternation may be requisite in the life cycle. Highly specialized or again confused by oscillating changes of the earth's crust over geological epochs, as the net result of foldings of the surface-layers. Older laminar ramuli of algae attain further...
elaboration of mechanism, orientations, and anatomy as "leaves"; attachment-ramuli exaggerate their absorbing function as they penetrate massed decaying material, now for the first time associated with cryptogamic organisms as bacteria, constituting the first soil. Internal and external effects of cells or storing walls in the charade of photosynthesis are utilized as mechanically supporting fibres; others from a water-storing function attain a conductive significance. Isolates are in connection with a transpiration mechanism which now becomes the only means of obtaining food-ions of organic nature. Most remarkably and constantly the axenal spore-tetrad, following mosaics in the pattern of bryophytes (as in Ditysoga and Floridopteris) are utilized as air-borne spores; while the sexual gametes retain their older plankton mechanism of sexual fusion in an aqueous medium, so far as they become mature from such beginnings arise the Bryophyta (Massae, in which fertilization is accomplished by spermatozoids) or more or less complete parasitic decadence of the spore-producing generation, and the Pteridophyta (Forna), in which great perfection of the angiospermy plant is acquired through the introduction of a new protozoa stage with precociously effective sexual organs, correlated with a minimum period in which the necessary water may be available; and so of tetraspores are adapted to a spatial mechanism which will define in this plan.

No plant-lymph which had not previously attainted to a two-phase cycle has made good on the land; since following the attainment of fertilization in sili the sexual spores of the complementary geos has been up to the time involved in such evolutionary progression have been emphasized by data for the decay of radioactive minerals, and affording a clue by means of which geological epochs may be approximately estimated. The datum of 900 million years for the Carboniferous and Devonian, in which forest-trees of coniferous habit have existed, as also the Rhynie group of the Lower Devonian which may express extreme types of Pteridophyta or limiting cases of Bryophyta, appears but of small value in the evolution of such high-grade land organisms as timber-trees from mosses. The general estimate of 2,000 million years for the first stages of transmigration may not appear excessive; and behind this stretches the indefinite range of the evolution of the algal series, to the more remote epochs of the plankton-phase of the evolution of the cell in all its manifold possibilities and controlling functions.

IX. Anatomy and Palaeobotany.—Progress in anatomical, and in palaeontological Botany essentially go hand in hand. The discoveries of well-petrified new forms of fossil plants, which are often difficult of identification, lead to more critical examination of the structure of recent plants, and thus bring to light interesting features in the latter. Yet both the methods pursued and the type of material available for the botanist and palaeobotanist tend to differ. Knowledge of the anatomy of the fossil Angiosperms is, however, by no means restricted owing to the scarcity of material other than of Tertiary age. Much isolated fragments of Tertiary wood have not attracted any particular attention in recent years, largely owing to the difficulty of mastering the overwhelming mass of living species with which they have to be compared. The original and phylogenetic source of the Angiosperm families is thus still wrapped in mystery in spite of various hypothetical conceptions. The only secure fact is that in geologic time corresponding to the Mesozoic era in Great Britain, and approximately to the Neocomian of the world, no reliable material of Angiosperms of any sort has yet been discovered. Claims to have identified Angiosperms in these or earlier rocks are not substantiated, and originated from such errors as incorrect diagnosis of ferns possessing reticulated venation like Dictyophyllum (see exposures by Berry, 1911, and Stopes, 1915).

The earliest authentic Angiosperms are found in the Lower Green-sand of Great Britain, and these are recognized as being markedly distinct from that of the Wealden, which is of the Jurassic type; that of the Lower Greensand, on the contrary, was a rich, mixed flora, including many varieties of coniferous woods, the famous Kripton Honorata of Kidston and Lang, and of the Bennettites, with nontetraploid plants, and, in particular, several Angiosperum woods. The systematic position of these Angiosperms is scarcely determinable, owing to the fact that modern plant anatomists have not yet elucidated the significance of woody structures in the living, and spite of the extensive beginning made by Moll and Jannasch. The petrified features of the ancient genera Cantia, Woburnia, Sabulia, etc., of the woods of Tertiary, Creno, Stopes, Godthi, Thomson, Hollick, Jeffrey, and Joubert, Coyle and Chamberlain, and others. While the English school have in the main added wherever possible new data on the recognized accepted lines of the general grouping, Americans under Jeffrey's leadership have contributed largely to palaeobotany. The Archaeaceae and the Angiospermopsidae are less primitive than the Angiosperms, being derived from ancestral forms characterized by woody stems. While Jeffrey's conclusions have been conclusively accepted, workers of his school have contributed handsomely to the accumulation of data from living forms, and his text-book of anatomy attempts to bring out guiding principles, chief among which is the "Doctrine of Correlation of Plants." The recognition of the systematic position of these plants is an important factor in palaeontological and geological study of the fossiliferous sands of the Wealden series, and the "Doctrine of Reversion." In Britain no comprehensive theoretical work on general anatomy has appeared recently. The anatomy of seedlings has been pursued (H. B. Blakese) and the recent developments in palaeoentomo-logical studies owing to their tenaciousity.

From rocks of Palaeozoic age onwards, well-petritified Gymnosperms have been maintained (see in particular the work of Jeffrey, Groom, Stopes, Godthi, Thomas, Hollick and Jeffrey, Coulter and Chamberlain, and others). While the English school have in the main added wherever possible new data on the classified lines of the general grouping, Americans under Jeffrey's leadership have contributed largely to palaeobotany. The Archaeaceae and the Angiospermopsidae are less primitive than the Angiosperms, being derived from ancestral forms characterized by woody stems. While Jeffrey's conclusions have been conclusively accepted, workers of his school have contributed handsomely to the accumulation of data from living forms, and his text-book of anatomy attempts to bring out guiding principles, chief among which is the "Doctrine of Correlation of Plants." The recognition of the systematic position of these plants is an important factor in palaeoentomo-logical studies owing to their tenaciousity.

The primitive Palaeozoic gymnosperms are gradually becoming very well known from the relative frequency with which their stems, leaves and other parts are found petrified. The most notable recent addition to the group is the exceptional little flora of plants from the very base of the Carboniferous of Kentucky (see Scott and Jeffrey) which bears considerable likeness to the primitive Safford flora described long since by Unger.}

The primitive Palaeozoic angiosperms are gradually becoming very well known from the relative frequency with which their stems, leaves and other parts are found petrified. The most notable recent addition to the group is the exceptional little flora of plants from the very base of the Carboniferous of Kentucky (see Scott and Jeffrey) which bears considerable likeness to the primitive Safford flora described long since by Unger.
more than a specialization on "prophetic" lines by a cohort which became extinct, comparable to another specialization in another family of the same order (Cycadales). The phytology of the Cycads is fascinating, because it is based on the discovery of fossil remains of the Lycophyta which, though truly Lycophyta, developed "seeds." Another branch of the great Mesozoic group, the Williamsonia, may prove to be the most significant fossil. The small form Williamsonia, described by Thomas from the Jurassic, has an interesting and suggestive morphology. The anatomical work on the genus, however, is more detailed and has contributed to a better understanding of the details of the plant, particularly the stems and petioles. Data of interest to anatomists have been chiefly based on Coal Measure species, filling in supplementary details in previously published accounts. The most important contribution in this connection has been the thorough handling of the Osmundaceae, made possible by discoveries of well-petrolized Mesozoic and Tertiary species (see in particular the series of Memoirs by Kidston and Gwynne-Vaughan). From a numerical study of a series of species, the authors were able to present a phylogenetic sequence in the evolution of the family from Palaeozoic times, and held that the group arose from some protozoic stock, which is an admission in opposition to the discovery of a true prototastic Osmundacear form. The Botulopteris, with its intricate system of stellate variations continued to receive detailed consideration (see Bertrand, Scott, Ziemaschko, and Kidston). The discovery of the Embryophyta has been thoroughly known. A few of wide geological distribution and of peculiar anatomical structure was at last made clear by the work of Kidston and Gwynne-Vaughan on Tempsky. Access to the original phytology, which is a comparative anatomical study of different forms of plant, has been made by Stopes, 1915. The work of Schoute on the branching of the Psaronia should be read in connexion with Tempsky which has an extraordianary close resemblance to the Palaeozoic forms. The recent works of Walther and Jeffray have contributed to the anatomical attention which makes it possible to demonstrate the phylogenetic series connected with the higher families of recent ferns, such as Kidston and Gwynne-Vaughan have presented for the Osmundaceae. Yet where anatomical studies have been undertaken on recent genera, as by Lang on the Ophioglossacea, they are largely influenced by the general principles of palaeobotany and the theme (as a sort of let-i-ma) of the solid ancestral stem, runs throughout.

Of the lower Pteridophytes, our knowledge of those impressive members of the Lycopodaceae, the Lycopodendron series, was at present restricted and in the last decade has merely received detailed amplification. In the more primitive groups, however, great advances have recently been made through the active interest taken in the Deciduous group by Thomas, and to a large extent part of the structural details of a number of noteworthy species. This was so followed up by Kidston and Lang, to whom were entrapped the plant materials of the now famous Rhynia chers. The Pteridophyte of Dawson, so long relegated to insignificance, and by many considered to represent merely imperfect fragments, has thus suddenly become of great interest. In the Scottish chers well-petrolized genera which anatomy shows very much the type of structure postulated so long before by Dawson. Some sporoigles and leaves, Rhynia, Hornw, Stereophyllum, Kidston and Lang represent the earliest known land plants, and though varying in details, all show general similarity in the arrangement of their organs and terminal sporoigles. These plants are stimulating discussion on the origin of land plants, the evolution of the Pteridophytes from the lower groups, and the morphology of the various organs and their development. It is now widely agreed that their anatomy is of deep morphological and phylogenetic significance.

Anatomical work on the Bryophyta still has to confine itself to living forms because fossils are almost non-existent. Various fossils of the last-described group of new fossils, however, are highly suggestive for those who consider the phylogeny of the mosses. That isolated family, the Characeae, is well represented in many deposits, and from them south of the Yukon (Canada) is derived. The anatomical features of the Characea, however, are but sketchily outlined with full examination of the anatomy of many beautiful fossil forms.

In palaeontological as in modern anatomy, observation is generally concentrated on the vascular tissues, and particularly on the arrangement of the bundle. There is a universal application of the vascular system to difficulties for the palaeobotanist, who sometimes finds in his specimen other portions of plants which are difficult to diagnose, and the difficulty is increased by the wide use of the comparative study of living organs by recent botanists. For instance, especially since the "clearing method" was popularized by Nathorst, the study of the mummified "cuticle" from fossils of all kinds has brought to prominence the general ignorance concerning the diagnostic value of and main characters of the stomata and epidermal cells among the ferns, and the results are now very marked. The palaeobotanists have been aided to a very large extent in this direction by the study of the groups of living forms to effect his own comparisons. This in small genera of gynnosperms has not been crushingly burdensome, and the study of the sporangia of the genus Glossopteris has led to a knowledge of the details of recent forms (see Berry, Halle, Thomas, and Bunche, and others). But for workers among the more extensive families of recent angiosperms, comparisons have become overwhelmingly burdensome, and after many years of study, the discovery of angiosperms found in Tertiary deposits has become a work of the highest specialization in the hands of Mr. and Mrs. Clement Reid, who have greatly extended our knowledge of recent deposits, by the aid of Hubbe and on the European Continent, so that has hemosified of the Tertiary deposits of the Northern Palaeozoic and the Mesozoic of the Southern Hemisphere. In the above paragraphs the more botanical and phylogenetic aspects of plant anatomy have been considered. But the palaeobotanist can still find a field for work and a field for an anatomical knowledge of fossil species. The value of the anatomical structures of the leaves, stems and so on of fossils of given localities and epochs in determining the nature of the climates of the past has long been recognized, and in the last decade this subject has chiefly been pursued by Berry in America, who has extensively surveyed the Upper Cretaceous and Tertiary climates and distribution of species. In the southern hemisphere, that terra incognita, has been a little illuminated by the observations (see Seward and others) which have brought back by the Scott expeditions. And Gothan has worked on the woods from the Arctic. Recent palaeobotanical work in England and America has been in connexion with a detailed study of coal. Many of the earlier workers (Dawson, Williamson, Huxley and others) were interested in the spores and small structures to be seen in coal and in recent years, there has been a large amount of work devoted to their development and of the number of species, the nature and localization of the spores and spore cases, and so on.

X. CYTOLOGY.—Great advances have been made in the study of cytology, but considerable divergence of opinion still exists with regard to many details of nuclear phenomena (see also the separate article CYTOLOGY). The discrepancies and contradictions present in the accounts of mitosis are due to the fact that no animal or plant has been found in which all of the phases connected with nuclear division can be elucidated. Each form has individual cytological characters, and its nuclei may show some stages with exceeding clearness, whereas others may be disregarded or apparently even eliminated. The true version will only be attained by wider comparative investigations.

I. SOME DIVISIONS (fig. 1) Most cytologists agree that, as a rule, during telophase each somatic chromosome splits into longitudinal halves (threads), and these halves tend to separate, forming more or less of a reticulum, according to the degree of interkinetik rigidity of the chromosomes. These facts can be illustrated by two ways: (a) that the pairing of threads in the prophase is the reassociation of the chromosome halves which separated during the preceding telophase, that these gradually come together to form the chromosome, and (b) that the pairing of threads and the splitting of the invamental chromosomes into daughter halves are purely prohapic phenomena and bear no relation to the splitting of the chromosomes in telophase. (Fraser and Snell 1911, Müller 1921, Grégoire 1912, 1913, Sharp 1915, Digny 1919.)

(2) Metale division. Controversy rages over the mode of
origin of heterotype chromosomes. The differences between the
B two schools of thought ("telosynaptists" and "parasynaptists")
rest on the interpretation of the heterotype prophases (Farmer
1912) (fig. 4). Telosynaptists regard the paired threads of the

Presynaptic and synaptic phases (fig. 2) as the associating
hairs (homologous with the threads of the somatic prophases) of a somatic
chromosome which separated during the preceding telophase, and
maintain that the conjunction of the two entire homologous somatic
chromosomes takes place prior to, and during second contraction
(fig. 3); consequently the associating threads of synopsis only
separate as daughter chromosomes on the homotype (2nd meiotic)
spindle.

Fig. 1.—Diagram of a Somatic Division.

Fig. 2.—Synopsis (Osmunda regalis)
(From La Cellule, vol. XXIV.)

“Parasynaptists” (Grégoire’s school), on the other hand, regard
the paired threads of the presynaptic and synaptic prophases
(fig. 2) as the pairing of the entire homologous somatic chromosomes
which will separate on the heterotype (1st meiotic) spindle. They
attach no significance to the second contraction phase. (Stomps
1911, Davis 1911, Lawson 1912, Grégoire 1912, Fraser 1914, Noth-
nagel 1916, Digby 1919.)

Fig. 3.—Second Contraction (Smilacina)
(From Trans. Roy. Soc. Edin-
burgh, vol. XLVIII.)

Fig. 4.—Diagram of Meiotic Phase.

The doctrine initiated by Boveri concerning the individuality of
chromosomes is now widely supported. It is based on three
main facts: (a) the continuity of chromosomes can sometimes
be traced from telophase into the ensuing prophase, especially
in rapidly dividing tissues; (b) the specific number of chromo-
somes, in any given animal or plant, recurs at each mitosis with
extraordinary regularity.1

Fig. 5.

Fig. 6.—Extrusion of Nuclea.
(From Archiv für Zellfor-
schung, vol. XIV.)

As regards dimensions, the width of chromosomes, both in ani-
mals and plants, is inconstant and more or less variable, and is in
no way correlated with phylogenetic affinity (Farmer and Digby 1914).

"Parasynaptists" (Grégoire’s school), on the other hand, regard
the paired threads of the presynaptic and synaptic prophases
(fig. 2) as the pairing of the entire homologous somatic chromosomes
which will separate on the heterotype (1st meiotic) spindle. They
attach no significance to the second contraction phase. (Stomps
1911, Davis 1911, Lawson 1912, Grégoire 1912, Fraser 1914, Noth-
nagel 1916, Digby 1919.)

1 Tischler (1915) and Ichikawa (1916) have collated the numbers
recorded in plants; (a) chromosomes with striking individual charac-
ters of size and shape, distinguishing them from others in the nucleus,
(b) the specific number of chromosomes, in any given animal or plant, recurs at each mitosis with
extraordinary regularity.

* Winkler (1920) has produced tetraploid forms artificially.

1 The number of chromosomes is inconstant in degenerating tissues
such as endosperm and tapetum; nuclei with a double number may
occur in many animals and plants. These characteristic chromo-
somes invariably reappear at every mitosis.

Recently much attention has been given to the significance of
specific numbers of chromosomes. It has been conclusively shown
that closely allied species of many families have related chromosome
numbers, i.e. multiples of a common factor. This diploid, triploid,
tetraploid, etc., forms are distinguished (Marchal 1912, Gregory
This multiplication of chromosomes may prove to have an import-
ent bearing on mutation, e.g. Primula sinensis 12 (haploid number),
P. sinensis (plant) 24 (haploid number), Crepis vrens 3 (haploid number), Crepis leucopus 4 (haploid number), Crepis rubra 5 (haploid number), Oenothera Lamarckiana 7 (haploid number), O. gigas 14
(haploid number) (fig. 5).

Chromosomes of the megagametophytes of many plants are
haploid, a unique feature which affords an easy means of study.

Botha, Louis (1862–1919). Dutch South African statesman (see 4:252). The intention which Botha declared during his visit to England in 1907–1908 was to work for the welfare of South Africa regardless of racial differences—he subsequently carried this to the full. It became the main object of his life. During the Imperial Conference of 1907 Botha met Dr. (later Sir) Starr Jameson for the first time; at least there is no known record of any earlier meeting between the two men. Their meeting was destined to have momentous results for South Africa. They became close friends. Already in the mind of both there must have been the belief that the true interests of the country demanded union between the four colonies, Cape Colony, the Transvaal, the Orange River Colony (as it had been called since the South African War), and Natal. The belief was gaining ground, and in 1909 it took shape in the calling of a National Convention to form a scheme of closer union. Botha led the Transvaal delegation; Jameson that from the Cape. As the two leading colonies, the Cape and the Transvaal had on the whole the decisive voice in the Convention.

Botha’s personal share in the work of the Convention was important. It confirmed the opinion, already strong in South Africa, that Botha was the natural leader of the South African Dutch, and had qualities of personality and statesmanship which marked him out as the inevitable man to be first Prime Minister of a united country. Botha’s qualities were put to a severe test while the Convention sat. Then, and when the Union Act had been framed and he went with the South African delegation to England to see it through Parliament, Botha gave proofs of steady wisdom, self-control, and a far-sighted patriotism. Thus, when the Union was inaugurated by the first Governor-General, Lord Gladstone, in 1910, it was the unanimous approbation of the great majority of South Africans that Lord Gladstone summoned him as Prime Minister to form the first South African Cabinet.

Suggestions had been made that the first Union Ministry should be formed of both the principal parties in the old colonies. Botha rejected these proposals, though it was believed at the time that they appealed to his personal desires. His Ministry, represented, in the great majority of its members, the Dutch of South Africa and the political parties in the old colonies to which they adhered, though it included a representation of the English-speaking people of Natal. Botha had decided that to form what was known at the time as a “Best Man” Government would be to invite a fatal reaction towards crude racialism among the mass of the South African Dutch. Nevertheless the reaction came, for all his attempts to avoid it, before his Cabinet had been in office even for half of its term of five years. It came in the form of a revolt against his moderation and his attempts to hold the balance even as between English and Dutch. The revolt was led by General Hertzog, and caused a split in the Ministry and the dismissal of Hertzog in Dec. 1912. Two years later Botha resigned, with the inclusion of any members of the Unionist party — representing, with account taken of the influence of the Labour party in the cities, the English-speaking population.

In 1914 came the World War. Botha at once declared himself for Great Britain, prepared an expeditionary force against the neighbouring German colony of South-West Africa, and had landed his first detachments upon its coast when a rebellion of the Dutch flared behind him in the Transvaal and the Orange Free State, whose old name had been restored by the Act of Union. Botha took the field himself, crushed the rebellion by a series of rapid thrusts, went on to make Germany submit to German South-West Africa and completed the conquest of that country; and then organized both a force to assist in the British invasion of German East Africa and an expeditionary unit to fight for the Allies on the western front in Europe. These achievements were made possible by a decisive victory at the polls in 1915 and by the steady cooperation of the Unionist party in Parliament. When Mr. Lloyd George became Prime Minister of Great Britain at the end of 1916 and summoned the Imperial War Cabinet, Botha found his South African preoccupations too great to allow him to attend it; but he sent in General Smuts his alter ego, whose abilities, insight and cool judgment were invaluable to the British Government. Smuts became the single permanent dominion member of the Imperial War Cabinet, but his absence from South Africa threw a vast burden of work on Botha as Prime Minister. Botha found time to come to Europe to represent South Africa at the Paris Peace Conference, where his wisdom and sound judgment increased a European reputation already equal to that of any other dominion Prime Minister. He did not approve of many of the terms of the Peace Treaty, and did not hesitate to say so. But he was in full accord with the developments in British institutions which accorded to the dominion representatives in Paris the status of delegates from self-governing States equal in nationhood to the other Powers, and upon this development he insisted repeatedly after his return to South Africa. He died very soon after his return. His health had been failing for some time. Influenza attacked him, and at midnight Aug. 27–28 1919 he succumbed to heart failure resulting from it.

To his country Botha’s death was an irreparable loss. He had attained an influence there, unprecedented even when the disposition of the Dutch South African to give his heart to trusted leaders had been taken into account. He had been the embodiment of the English-speaking people of the country as no other leader of Dutch birth had been able to win it. The native population
believed in him and trusted him. Simple, modest, without personal ambition, he had yet the greatest gift in a national leader, personality. His kindliness was transparent, his temperament always inclined to compromise, his mind naturally impartial. In small things he inclined too often to give way. But in the big things his discernment of principle was unerring, his resolution adamant. Greatness was his by right of nature, a greatness recognized and acclaimed in his last years by the world no less than by his own countrymen.

BOURASSA, HENRI (1868-1907), French Canadian politician, was born in Montreal Sept. 1, 1868, the son of L. J. Papineau. He became well known at a comparatively early age as an active writer and speaker on the side of the Nationalist movement in Canada, and a leader of the younger school of French Canadians. He was elected to the Dominion House of Commons in 1896, but resigned in protest against Canadian participation in the South African War, 1899; he was re-elected, however, in 1900 and in 1904. He was a member of the Quebec Legislative Assembly in 1908-12. A gradual severance took place between him and his old chief, Sir Wilfrid Laurier, until in later years he became obsessed with the idea that Laurier's policy was fatal to the best interests of Canada and especially to Quebec. A speaker of extraordinary power and fascination, both in Parliament and on the platform, even Laurier himself could not sway the French Canadians as Bourassa could; and in spite of his extreme views he was heard with respect even in the strongholds of his opponents in Toronto.

BOURCHIER, ARTHUR (1861-1934), English actor (see 4.350), produced in 1910 Henry VIII. and Macbeth at the Garrick theatre, London, and in the same year joined Herbert Tree at His Majesty's theatre, where both he and his wife played again in these and other Shakespeare plays. He also played Iago to Mr. Matheson Lang's Othello in 1920. After the dissolution of his earlier marriage with Miss Violet Vanbrugh he married in 1918 Miss Kyle Bellevue, with whom he continued to appear in modern melodrama. He acted Old Bill in Capt. Bainsmith's war play The Belgic Front (1917).

BOURCHIER, JAMES DAVID (1859-1920), British publicist, who came of a good Irish family, was born at Bruff, co. Limerick, Dec. 18, 1859. He was educated at Trinity College, Dublin, and King's College, Cambridge, and afterwards was for some years an assistant master at Eton. Subsequently joining the staff of The Times, in 1888 he went as special correspondent of The Times to Rumania and Bulgaria, and for nearly 30 years he was its principal representative in south-eastern Europe. In this capacity he established a unique authority for information on Balkan affairs, and was in the confidence of the leading statesmen. He played an important part behind the scenes in the formation of the Balkan League (1912-2); and though from time to time his advice to one party or another proved unpleasant, his disinterestedness was always as unquestionable as his accurate knowledge of the political issues involved. In the later years before the World War his preoccupations were somewhat markedly on the side of Bulgaria, and even during the war his sympathies were with Bulgaria as a country. He died at Sofia, Dec. 30, 1920, and was given a public funeral there. Besides his contributions to The Times he was the author of many review articles and general articles, historical and descriptive, on the different Balkan States and Greece in the 11th Edition of this Encyclopedia.

BOUROIS, LÉON VICTOR AUGUSTE (1851-1907), French statesman (see 4.350), became minister without portfolio in the Briand Government during the World War. He took an active interest in the movement for a League of Nations, was appointed to draft its statutes and became president of the French section. He was elected president of the Senate in 1918.

BOURGET, PAUL CHARLES JOSEPH (1852-1921), French novelist and critic (see 4.350), published after 1910 several new novels, including La Vie posta (1910), Le Sens de la Mort (1915), Lazarine (1917), Némésis (1918), and Laurence Alboni (1920), as well as three volumes of short stories and two plays, La Barricade (1910) and Le Tribunal (1912). Two other plays, Un Cas de Conscience (1910) and La Crise (1912), were written by him in collaboration. A volume of critical studies appeared in 1912 and one of travel sketches, Le Démon du Midi, in 1914.

BOURNE, FRANCIS (1861-1923), English Cardinal and Archbishop of Westminster, was born at Clapham on March 23, 1861, and educated at Ushaw, Ware, St. Sulpice (Paris) and the university of Louvain. He was ordained priest in 1884, and in 1889 became rector of the Southwark diocesan seminary which he had founded. In 1895 he was appointed domestic prelate to Pope Leo XIII., and in 1897 Bishop of Southwark. In 1903 he succeeded Cardinal Vaughan as Archbishop of Westminster, and on Nov. 27, 1911, was created cardinal (titular of S. Pudenziana) by Pope Pius X.

BOYNE, HENRY TAYLOR (1852-1912), English engineer, was born in Devon in 1852. He was educated at Queen's College, Cambridge, of which he was afterwards elected fellow. Joining the staff of the Mersey Docks and Harbour Board, he became assistant engineer, but in 1857 was appointed professor of civil engineering and applied mechanics at McGill University, Montreal. In 1900 he was appointed to be the first rector of the Imperial College of Science and Technology in London, but ill-health obliged him to resign the post after a few months. He died at Eastbourne Feb. 2, 1912.

BOWELL, SIR MACKENZIE (1827-1917), Canadian statesman (see 4.350), died at Toronto, Feb. 17, 1917.

BOWLES, THOMAS GIBSON (1841-1917), British journalist and politician, was born in London in 1841, and was educated at King's College, London. In 1860 he entered the Inland Revenue office, remaining there until 1868, and afterwards travelled extensively. He subsequently became connected, either as journalist or proprietor, with various newspapers, notably Vanity Fair, The Lady, and offshoots from the last-named periodical. From 1870 to 1871 he was correspondent for the Morning Post in Paris. He was elected as a Conservative for King's Lynn in 1882, and held the seat till 1906, when he was defeated, largely owing to his advocacy of free trade. He was elected for the same seat as a Liberal in 1910, but was unsuccessful in the second general election of that year. He became well known as an expert in parliamentary procedure and a critic on public finance. In 1910 he was elected for the southern division of Leicestcr. Mr. Gibson Bowles was always prominent as an opponent of any diminution of British sea power, and he published Maritime Warfare (1878); Flotsam and Jetsam (1882); Log of the Neried (1886); The Declaration of Paris of 1856 (1900) and Sea Law and Sea Power (1910).

BOXING: see SPORTS AND GAMES.

BOYD, JOHN J. (1857-1917), American sculptor (see 4.354), died in New York, Feb. 19, 1917. He was made an associate member of the National Academy of Design in 1910, and received a silver medal at the Panama-Pacific Exposition, San Francisco, 1915.

BOYLESVE, RENÉ, the pen-name of RENÉ MARIE AUGUSTE TARDIVEAU (1867-1940), French novelist, who was born at La Haye Descartes, Indre-et-Loire, April 14, 1867. He was educated at Poitiers and Tours, and afterwards adopted literature as a profession. His first work was Le Médecin des Dames de Nêmes (1866), and henceforth he wrote voluminously, publishing not only novels but many short stories. He is a close associate of the provincial society of France. His later works include Sainte Marie des Fleurs (1897); Le Parfum des Îles Borréides (1898); L'Enfant à la Balustrade (1904); Le Bel Avenir (1905); Mon Amour (1908); Tu n'es plus Rien (1917); and Nymphes dansant avec des Satyres, a volume of tales (1920). He was received into the French Academy on March 20, 1910.

BOYNE, LEONARD (1853-1920), Irish actor, was born at Westmeath April 11, 1853 and was educated for the army. He first appeared on the stage in Liverpool in 1870. On May 2, 1874 he played John Fern in Progress at the St. James's theatre, London. He played the principal part in Henry Arthur Jones's The Masqueraders in 1894, and appeared in Pinero's The Benefit of the Doubt in 1895. In 1902 he made a success with Miss Marie Tempest in The Marriage of Kitty
BOY SCOUTS.—A brief reference was made in the article Scout (24,476) to the institution in England in 1908 of the Boy Scout movement. In later years it developed so strongly, both in England and in other countries, being also imitated, hardly less enthusiastically, by that of the Girl Guides on similar lines, that its history requires fuller record.

In 1893-4, when serving with his regiment, the 13th Hussars, Sir Robert (then Lt-Col., and later Lt.-Gen.) Baden-Powell realized that the ordinary peace training of soldiers for service in the field was not sufficiently practical, and he therefore carried out classes of training in his squadron for the men individually in scouting and campaigning. In 1897-8, having been transferred to command the 5th Dragoon Guards, he carried on similar training, but on improved lines, with a view to developing character —i.e., manliness, self-reliance, and reliability—and field efficiency since these were largely lacking in lads coming into the army from the ordinary board school. His lectures and practices were collated and published in a small book, *Aids to Scouting*.

During the South African War, 1899-1900, Maj. Lord Edward Cecil, Baden-Powell’s chief staff officer, organized the boys of Malting as a corps for general utility on scout lines rather than those of cadets, and the experiment was an entire success. The experience showed that, if their training were made to appeal to their boyish souls, they could be taught, not only to take responsibility to a far greater degree than was generally believed, if only they were trusted. The troop was made a small unit, in order that the commander should be able to deal with each individual on personal knowledge of him; the system of patrols was instituted, of six boys under a leader. In carrying out the organization of the South African Constabulary, 1901-3, Baden-Powell employed the same principles on an extended scale. Responsibility was thus given to the junior non-commissioned officers, and emulation between the patrols produced a good spirit and a higher standard of efficiency all round. The human side was appealed to, and the moral training—on their honour to a very large degree in carrying out their duties. Their uniform for field work was the cowboy hat, shirt, green tie, and shorts. Badges were awarded for proficiency in different lines of work.

In 1907 Sir Robert held a trial camp for scout training for boys at Brownsea Island, at which he had boys of every class to experiment upon, and its results exceeded his expectations and prompted him to go on with the idea. The training was based on that which he had employed with soldiers and the constabulary, with a little variation, but with an adoption of the ideas of Epictetus and the methods of the Spartans, and of the ancient British and Irish, for training their boys. He also looked into the Bushido of the Japanese, as well as the more modern method of John Pound for dealing with boys, and John for their physical culture, as well as those in practice by Sir William Smith, Seton-Thompson, Dan Beard and others. In Jan. 1908, he brought out the handbook of the training, entitled *Scouting for Boys*, in six fortnightly parts. A number of troops were started in different parts of the United Kingdom before the series was half completed. Although he had only anticipated that scouting would be taken as an additional attraction for their boys by the Boys' Brigade and Church Lads' Brigade, it became evident that a separate movement was required to deal with the number of boys who were taking it up unconnected with these bodies.

In 1910, the Boy Scout movement had grown to such dimensions (225,630) that Sir Robert felt it incumbent upon him to leave the army in order to take the movement in hand as "Chief Scout." With a view to making the subject appeal to boys, and to make their spirit of adventure, he took the idea of the doles given to woodmen, knights, adventurers and explorers, as the heroes for them to follow. These he grouped generally under the title "Scouts." Through camp life, boat work, pioneering and nature study could be found all the attractions for a boy which at the same time would be the medium of instruction. The instruction took the form of active self-expression on the part of the boy, rather than his passive reception of ideas.

Partly from his own experience and partly from that of others, Sir Robert worked out what is now known as "The Scouting Law." The deficiency lay chiefly in the direction of—(1) Character and general intelligence; (2) skill and handcrafts; (3) physical development and health knowledge; (4) service for others and for the State. To meet these, and provide for the boy's life, therefore, framed as far as possible to develop in (1), (2), and (3) the efficient individual, and then to harness his individuality for the good of the community, i.e., citizenship. The movement was made the high local for the boys. The organized medium by which the movement hinges, was taken from the code of the knights.

King Edward, and later King George V., became the patron of the movement of British Boys and the Boy Scout Association president. Administration was decentralized from the Imperial Headquarters Council (at 25, Buckingham Palace Road, London) through county commissioners, district commissioners, and local associations to the scoutmasters in charge of troops.

For organization the troop was purposely kept small in numbers (40 being regarded as the best maximum), in order that the scout- masters should have personal knowledge of each of his boys, being the only possible way of developing the character of the individual. The patrol system was adopted from that of the South African Constabulary, and for the same reason. An extensive system of inspectorates was instituted, in the Royal Navy and the Constabulary, for excellence in different branches of work.

The Boy Scout movement is non-military, non-political, non-class and interdenominational. Its aim is to make good citizens, and for this reason it was judged necessary to introduce military drill. Scouting is a means through which the veriest hooligan can be brought to higher thought and to the elements of faith in God; and, consequently, in the scout motto—"Be Prepared"—it gives the base of duty to God and to neighbour on which the parent or pastor or priest can build with greater ease the form of belief that is desired. The Scout Promise, to carry out, on his honour, as far as in him lies, the Scout Law, is the final discipline for each boy. The methods and methods of the movement were enshrined into the Boy Scout Law in 1912, and a Royal Charter of Incorporation was granted as an official recognition.

The peak of war in 1914 found thousands of scouts just sallying forth in their little, self-contained units with their tent cards and tents, and the Sea Scouts with their boats and equipment for their camping in the August holidays. By telegraph the object of their outing was changed; the Land Scouts were mobilized all over the country under the chief constables to patrol the railway bridges, waterworks, telegraph and cable lines. At the same time Sea Scouts at once took over the duties of watching the coast or the coastguardsmen, who were booked up for service allot; and there they remained till the end of the war, working under the orders of the Admiralty. Some 23,000 boys took their turn at this service. Over 100,000 of the older scouts and scoutmasters took their turn in service, and they did well. Ten thousand of them gave their lives for their country. Some of the V.C. heroes were Craig, Cates, Dymond (also a Boy Scout) Law, McAlack, Jack Cornwall, Dean, Haine and Hallows, formerly Boy Scouts.

Through scouting the boy has the chance to deck himself in a vesture that spirit of God lies on the part of the individual. He can track and follow signs, he can signal, he can light his fire and build his shack and cook his grub. He can turn his hand to many things in pioneer and carpentry. His unit is a band of six, commanded by their own boy leader. Here may be seen the natural and gang of the boy, whether for good or for mischief; responsibility and self-discipline for the individual; and esprit de corps for the honour of the patrol, as spiritual discipline and ideals of a community. The World’s Scout’s eye the scout’s staves are so many broomsticks, but to the scout they are different. His staff, decorated with his own particular totem and signs, is typical; like his staff, among a mass he is one of the individual have his own great characters, his own potentialities. He may be one of a herd, but he has his own entity. He gets to know the joy of life through the out-doors. Then there is the spiritual side. Through sips of nature lore, imbued in woodland lore, the practice of the disciplines for the forests. The wilderness is par excellence the school for observation and for realizing the wonders of a wondrous universe.

At the World Jamboree, London Science Museum, Aug. 1920, was held perhaps the most significant gathering of boys that has ever been known, when some hundred thousand Boy Scouts from 27 different countries—for the movement has spread over the world—came together to show to the world something of the methods and results of "Scouting for Boys." The fact that these boys, wearing the same uniform and obeying the same Scout Law, had started a remarkable personal inter-comradeship, might well be an important factor toward development that spirit of the good-lie on the part of the peoples themselves that was essential to the hopes founded on the League of Nations.
In 1921 there were 350,000 Boy Scouts in the British Empire, and approximately a million and a half throughout the world. (R. B.—P.)

United States.—Early in 1910 the idea of introducing into the United States the Boy Scout movement, with methods similar to those of the English Boy Scouts, which had been instituted in 1908 and developed under the personal supervision of Lt.-Gen. Sir Robert Baden-Powell, was first proposed by Mr. W. D. Boyce of Chicago. Before this time a number of troops had been started in various parts of the country by men who had been impressed with the possibilities of the scheme through reading Sir Robert's English handbook, "Scouting for Boys." It is significant that Mr. Boyce's interest was aroused by a service rendered him in true scout spirit by a London Boy Scout who, because of his obligation to do a good turn daily and the rule against the acceptance of gratuities, greatly astonished and impressed Mr. Boyce. After a conference with Sir Robert he secured the cooperation of friends in Washington, D.C., and on February 8, 1910 incorporated an organization of the Boy Scouts of America under the laws of the District of Columbia. With the cooperation of other agencies interested in boys, the plans for the organization were developed, and the administration was placed in the hands of a national council working through an executive board and through local councils and scout officials throughout the country. In 1910 a small office was opened in New York and in 1911 headquarters were established at 200 Fifth Ave. in that city. Federal incorporation was granted by Act of Congress in June, 1916.

Boy Scouts are organized in patrols, 8 boys to a patrol, 2 to 4 patrols to a troop. Each troop is under the charge of a scoutmaster, who must be an adult American citizen, and one or more assistant scoutmasters. Troops are organized in connexion with schools, churches and other institutions, or under the auspices of a group of representative citizens. For each troop there is a supervising group of adults known as a troop committee. Where there are two or more troops in a community their activities are directed and supervised by local councils. The national council is made up of representatives from these local councils and other distinguished men from every state in the union. This body meets annually in New York City, where the Council has its administrative and executive headquarters. The president of the Boy Scouts of America in 1921 was Mr. Colin H. Livingston of Washington, D.C.; its honorary president, the President of the United States, and its chief scout executive, James E. West.

The purpose of the Boy Scouts of America as stated in its constitution is "to promote through instruction and cooperation with other agencies, the ability of boys to do things for themselves and others, to train them in scout-craft, and to teach them patriotism, courage, self-reliance and kindred virtues, and at the same time to develop their bodies to such an extent that they are now in common use by Boy Scouts, by placing emphasis upon the Scout Oath and Law for character development, citizenship training and physical fitness. The movement is non-sectarian and non-political in nature and the only purpose of the organization is: 'Be prepared.'"

The membership in Sept., 1921 was 416,676 registered scouts, 119,283 scout officials, 17,738 troops, 607 local councils. (J. E. W.)

Girl Scouts.—In March, 1912 Mrs. Juliette Low organized in Savannah, Ga., a group of Girl Guides, patterned after and bearing the same name as the organization developed in England by Lt.-Gen. Sir Robert Baden-Powell and Lady Baden-Powell. In both cases the purpose was to offer girls activities similar to those open to Boy Scouts. The movement spread rapidly and on June 10, 1913 the organization was incorporated and its name changed to "The Girl Scouts of the United States of America," headquarters being in Washington, D.C., but later removed to New York City. In Oct., 1921 the number of registered Girl Scouts was about 120,000, and applications for membership were being received at the rate of 3,000 per month. The purpose is to instill patriotism, to arouse the spirit of helpfulness, and to develop character, largely through group activity. The motto is "Be prepared"; and the slogan, "Do a good turn daily." Each member promises: "On my honour, I will try to do my duty to God and my country, to help others at all times, to obey the Scout laws." These laws, in number, require a Girl Scout to be trustworthy, loyal, helpful, friendly, courteous, kind to animals, obedient, cheerful, thrifty, and clean in thought, word, and deed. Originally the age limit was fixed from 10 to 18 years, and this central group continued to be the largest; but later a separate division was formed for girls, known as Brownies or Junior Scouts, and another division for mature girls, known as Citizen Scouts. The unit is a patrol of eight girls, who choose from their number a leader. One or more patrols form a troop, whose captain must be at least 21 years old and approved by the national headquarters. A captain may have one or more lieutenants, at least 18 years old and approved by the national headquarters. The official magazine is The American Girl, a monthly publication.

Camp Fire Girls.—Another organization, wholly distinct, representing the scout movement in the United States is the Camp Fire Girls, for girls over twelve. It was founded in 1912 to promote the ideals of the "home, health, and citizenship." The training stimulates love of being out of doors and an interest in simple handicrafts like knitting and weaving. The organization uses its work by recognizing the doing of small tasks well and by awarding "honour-badges" in the seven Camp Fire "crafts" of "home, nature, health, hand, camp, business, and patriotism or citizenship." The slogan is "Give Service," and the watchword "Wohelo" (work, health, love). There were 130,000 members in 1921, living in every state of the United States and in 18 foreign countries. An allied junior organization is the Blue Birds. The official organ is Everygirl's Magazine. The headquarters of the Camp Fire Girls are in New York City.

BRACQUEMOND, FÉLIX (1853-1914), French painter (see 4.369), died in Rennes, July 20, 1914.

BRADbury, SIR JOHN SWANWICK (1872—__), English civil servant, was born at Winsford, Cheshire, Sept. 23, 1872 and educated at the Manchester grammar school and Brasenose College, Oxford. He entered the civil service in 1896. Beginning in the Colonial Office, he was soon transferred to the Treasury. In 1911 he was appointed a member of the National Health Insurance Commission, but in 1913 returned to the Treasury as joint permanent secretary. In that capacity it fell to his lot to sign the currency notes issued by the Government when gold was withdrawn from circulation on the outbreak of the World War. Hence his first popular name of "Bradbury." He was made K.C.B. in 1913, and in 1919 was appointed chief British representative on the Reparations Commission. In 1920 he was given the G.C.B.

BRADDOIv, MARY ELIZABETH [MRS. JOHN MAXWELL] (1837-1915), English novelist (see 4.369), died at Richmond, Surrey, Feb. 4, 1915. Among her latest novels were The Green Curtain (1911) and Miranda (1913).

Her son WILLIAM BABINGTON MAXWELL (1866—__), born June 4, 1866, became known as a novelist and newspaper correspondent. His novels include Vixen (1905); The Guardsman's Flame (1906); Miss Thompson (1911); The Man's Way (1916); The Man and his Lessons (1919) and A Remedy against Sin (1920). He served with the Royal Fusiliers during the World War (1915-7) and attained the rank of captain.

BRAGG, SIR WILLIAM HENRY (1892—__), British physicist, was born at Wighton, Cumb., on July 2, 1892 and was educated at King William's College, Isle of Man. He subsequently entered Trinity College, Cambridge, being elected to a major scholarship in 1912. He was third wrangler in 1884 and in the following year obtained a first class in part III of the mathematical tripos. In 1986 he was appointed professor of mathematics and physics in the university of Adelaide, S. Australia, and in 1888 he carried over his earlier researches upon radioactivity. He took an active interest in the development of scientific enterprise in Australia, was a member of the council of the Adelaide University from 1903 to 1906, of the council of the South Australian School of Mines and Industries from 1905 to 1908 and president of the Australasian Association for the Advancement of Science, Brisbane, 1909. In 1909 he was appointed Cavendish professor at Leeds University, where he remained until his election in 1915 to the Quain professorship of physics in the university of London. He was awarded the Nobel Prize for Physics in 1922 and the Barnard gold medal (Columbia University), both of which distinctions he shared with his son William John Bragg (b. 1890), who in 1919 became...
BRAMLEY—BRAUN

489

Langworthy professor of physics in the university of Manchester. The joint work of father and son has gone far towards elucidating the arrangements of atoms in crystals, an achievement rendered possible by their development of the X-ray spectrometer. During the World War Sir William Bragg's services were placed at the disposal of the British Government in an advisory capacity; he was more especially associated with the problem of submarine detection. His public services of a confidential nature were acknowledged by the bestowal of the C.B.E. in 1917 and by his creation as K.B.E. in 1920. In the same year he was elected an honor. fellow of Trinity College, Cambridge, and served as president of the Physical Society of London.

In addition to many publications, chiefly upon radioactivity, in the Philosophical Magazine and the Proceedings of the Royal Society, he has written The World of Sound (1917), a passage on or a series of lectures given to a juvenile audience at the Royal Institution in 1919 and, in collaboration with W. L. Bragg, X-Rays and Crystal Structure (1915).

BRAMLEY, FRANK (1857-1915), English painter, was born near Boston, Lincoln, May 6 1857. He studied art at Lincoln and later at Antwerp, first exhibiting in the Academy in 1884. Bramley became one of the best-known members of the group of English painters known as the Newlyn school, and in 1888 his picture, "A Hopeless Dawn," was bought under the terms of the Chantrey bequest. He became A.R.A. in 1894, and was elected R.A. in 1911, being also a gold medallist of the French Salon. He died at Chalfield Hill Aug. 10 1915.

BRANDEIS, LOUIS DEMBITZ (1856- ), American lawyer and jurist, was born in Louisville, Ky., Nov. 13 1856. He was educated in the public schools of his native city and at the Ann Realschule, Dresden, Germany. He graduated from the Harvard Law School in 1877, was admitted to the bar in 1878, and practised in Boston from 1879 to 1916. As a member of the Public Franchise League he took an active part in preserving municipal control of the Boston subway. He was instrumental in 1880 in the establishment of the Boston Sliding Scale Gas Act and was a pioneer in the movement for establishing life insurance through savings banks. He opposed the monopoly of transportation by the New Haven railroad in New England. He was much interested in labour legislation, acting as counsel for the people in cases involving the constitutionality of fixing hours of labour and a minimum wage in several states. In 1915 he acted successfully as counsel for the Government in the suit brought by the Riggs National Bank in which the bank charged the Secretary of the Treasury and the Comptroller of the Currency with conspiracies to wreck it. In January 1917 he was appointed by President Wilson to succeed the late Justice Lamar as associate justice of the United States Supreme Court, being the first Jew to attain this position. He was the author of Other People's Money and Business as a Profession, besides numerous articles on public franchise, business efficiency, labour and trusts. He was prominent in Zionism and in 1914 was made chairman of the provisional committee for Zionist affairs.

BRANDEIS, GEORGE MORRIS COHEN (1842- ), Danish critic (see 4.4.27). The complete popular edition of his works was published in 10 volumes in 1880 and 1890, and the German edition appeared in Munich in 8 vols. between 1902 and 1904. His later monographs include Arnaud Carrel (1911); Goethe (1913); Voltaire (1916); Napoleon and Garibaldi (1917) and Caius Julius Caesar (1918). He produced in 1919 a study of the Schleswig-Holstein question, Sønderjylland under præsisk Tryk (South Jutland under Prussian Tyranny), and a drama, Tragediens enden Del, Fredslutningen.

BRANGWYN, FRANK (1867- ), English painter (see 4.4.39). Among his later works are decorations for the Courts of Justice, Cleveland, U.S.A., and the new Parliament building at Winnipeg, Canada. He also decorated the Court of the Seasons at the Panama-Pacific Exposition, San Francisco, and in 1921 was engaged on work for the State Capitol of Missouri at Jefferson City.

BRANTING, Hjalmar (1860- ), Swedish statesman, was born in 1860. As a student he seemed at first destined for a scientific career. He early devoted himself to astronomy and for a period he acted as junior official in the observatory of Stockholm. His keen interest in political and social questions, however, soon drew him into journalism and politics, and he threw in his lot with the then small group of Social Democrats in Sweden. In 1886 he assumed control of the weekly journal Socialdemokraten, their leading organ, which later was converted into a daily. In 1888 he was condemned to a short term of imprisonment on account of his articles. He was elected a member of the Second Chamber of the Riksdag in 1896. An able speaker and tactician, he exercised in Sweden an influence proportionate to the growing numbers of his supporters. He joined the Eden Government in the autumn of 1917 as finance minister. When this ministry fell in 1920 he became prime minister and formed an entirely Social-Democratic administration which, however, resigned office in the autumn of the same year (see SWEDEN). Meanwhile he had played an important role in international labour politics. He acted as representative of Swedish Social Democracy at all the congresses of the First International, and in the summer of 1917 he was chairman of the Dutch-Slavianian delegation which sat in Stockholm and conferred in turn with delegations from the Socialist parties of most of the belligerent countries with a view to devising a platform for joint intervention by them in the interests of peace, the moving power being Camille Huysmans, the secretary to the International. Their efforts were unavailing. In Jan. and Feb. 1919 Branting was chairman of the International Social-Democratic Conference in Berne, at which British, French and Germans met for the first time since the war. He was a member of the executive committee of the Second International, which later sat in London with Mr. Henderson as its chairman. He had taken an active part in most of the Scandinavian workmen's congresses since 1888; and at the ninth congress in Copenhagen in 1920 he introduced the question of "democracy and dictatorship," the debate on which this ministry fell in 1920 was a resolution by a solid majority, representing up to 800,000 organized workmen, against a small Norwegian minority, disapproving of the Bolshevik policy and adhering to the Second International.

Branting took a warm interest in the claim of the inhabitants of the Aland Is. to be allowed to decide the permanent position of the islands by means of a plebiscite, and he represented Sweden in this matter at the first attempt in Paris in 1919 to secure a decision from the Supreme Council, at the consideration of the problem by the Council of the League of Nations in London in July 1920, in Paris in Sept. 1920, and at Geneva in July 1921 (as Sweden's leading delegate). He was Sweden's leading delegate also at the first meeting of the League of Nations at Geneva in Dec. 1920 and chairman of the sixth commission which dealt with the questions of disarmament, of blockade and of mandates. He was elected by the Council a member of the "Commission temporaire pour la réduction des armements," for the carrying-out of which the commission made an appeal.

BRASSEY, THOMAS BRASSEY, 1ST EARL (1836-1918), British politician (see 4.4.33), who was created an earl in 1911, died in London Feb. 23 1918. He was succeeded by his son, THE VISCOUNT BRASSEY (b. 1869), who died in London Nov. 12 1919. The 2nd earl left no children, and the title became extinct.

BRAUN, HEINRICH (1854- ), German Social Democrat and writer on social questions, was born Nov. 23 1854 at Leipzig, and studied at Vienna, Göttingen, Berlin and Halle. He successively edited the important Socialist publications, Die neue Zeit; the Archiv für soziale Gesetzgebung und Verwaltung; Die neue Gesellschaft; and Annalen für Sozialpolitik und Gesetzgebung. After the revolution and the election of a Prussian Constituent Assembly, Braun was Minister for Agriculture in the Prussian Social Democratic Ministry formed under the presidency of Hirsch on March 24 1919.

LILLY BRAUN (1865-1916), wife of the aboven, was one of the most remarkable women Socialists and writers of modern Ger-
many. She was the daughter of Gen. von Kretschmann, of an old Prussian Junker stock, and was born at Halberstadt on July 2 1865. Her grandmother was the issue of one of the amours of Prince Jerome Bonaparte, King of Westphalia. Her whole life early was passed in a Junker and militarist atmosphere, and she was thus steeped in the traditions of the Old Prussian estate of her grandfather, or in the various garrisons where her father held command. She had a deeply introspective nature and read widely. The romantic as well as the social and ethical ideas which she developed contributed to alienate her from her class and her family and to draw her into the Socialist movement. Her first marriage (against the wishes of her family) was with an invalid socialist professor, von Gizycki. After his early death she was attracted by the Socialist author and politician Heinrich Braun and married him in 1895. She visited England and was on terms of friendship with leading members of Fabian Society. She was the author of many books and pamphlets on social questions, particularly on the place of woman in politics and industry, e.g. Frauenfrage und Sozialdemokratie (1901); Frauenarbeit und Handwirtschaft (1901); Die Politik und die Frauen (1904). But her most remarkable work was the story of her own life, told, like Goethe’s autobiography, with some embellishments of fancy and, indeed, professedly in the form of a novel. The two volumes are entitled Memoiren einer Sozialistin (1) Lehrjahre (2) Kampfjahre (1900 and 1911). They give an elaborate picture, coloured no doubt by the intense self-consciousness of the writer, of the growth of the German Social Democratic movement in the nineties, with the sketches of the leading figures, such as Bebel, Liebknecht, Rosa Luxemburg, and her own husband, Heinrich Braun. No German book brings out more clearly the nature of the cleft between the German and Prussian governing and military classes on the one side and the industrial masses and their leaders on the other. The contrast between German life in the country and in the cities is also vividly portrayed, as is the social life of a regiment and a garrison. Other books of hers are Im Schatten der Titanen (memos of her grandmother, who lived for a time in Goethe’s circle); Liederschreiben einer Marquise; a play, Mutter Maria, and a novel, Lebewohl von den Schatten (1906).

Brazil

(see 4.438).—No general census of Brazil had been taken since 1900 and 1920, but the total pop., estimated in 1908 at 26,515,000, was officially stated in 1917 to be 27,473,570. This figure, which is probably somewhat exaggerated, would give an average density of 8.3 per sq. mile. Estimates of municipal pop. in 1913 (probably not very accurate) were: Rio de Janeiro, 976,000; São Paulo, 400,000; Bahia (São Salvador), 348,000; Pará (Belém), 275,000; Pernambuco (Recife), 216,500; Porto Alegre, 130,000. The problem of immigration for so scantily peopled a country is a vital one. Its great fertile plains yield all the products of the tropics and subtropics, and it is not likely that its resources, yet far from exhausted, its enormous mineral deposits scarcely tapped, while grazing and agriculture are still far behind their possible development.

Vast regions in the interior are still unsettled, and some even unexplored. The most notable geographical achievement of the decade 1910-20 was the expedition made in 1914 by Theodore Roosevelt, in conjunction with Col. Rondon and other Brazilian officers, down the Rio Duvida (River of Doubt), of which by far the greater part had never been visited. The personnel of the expedition included, besides Theodore Roosevelt, his son, Kermit Roosevelt, two biologists, an engineer and a surgeon. The journey, interrupted by many portages, involved a distance of 470 m., and lasted two months, from Feb. 27 to April 26. After four days’ progress down stream, cataracts were met with, and the next 60 m. took 42 days to accomplish. The river proved to be a tributary of the Madeira, some 640 m. in length, and joined the main stream in lat. 5° 20’ S. The general course, though very tortuous, is due N. running through rugged, densely wooded country almost devoid of animal life. It is now officially known as the Rio Roosevelt. In Through the Brazilian Wilderness, Roosevelt gave the credit for the discovery to Col. C. M. da Silva Rondon and to those associated with him on the Telegraph Commission during their six years’ work before his own journey.

The number of immigrants registered during the years 1908-19 was as follows:—

A constant effort is made to maintain the price, by imposing an additional tax on exports over a certain amount, by encouraging consumption through propaganda abroad, and in São Paulo by offering further extended credit facilities. Under the Convention or Valorization Scheme of 1907 (see 6.647) was resorted to again in 1917. In 1907, when the planters of Brazil faced ruin owing to over-production, the state of São Paulo, supported by the Federal Government, undertook to buy the rice, beans, coffee,bacon, pork, and other staples. Italian bankers, bought up 8,000,000 sacks and stored them for disposal in a more favourable market. When the World War broke out, coffee to the amount of 3,000,000 sacks still in the hands of the growers was taken over by the belligerent Governments. In 1917 the state of São Paulo, to stabilize the price which was threatened by a large crop and restricted markets, purchased 3,000,000 bags, and constructed enormous warehouses for their storage on the docks at Santos. The destruction by frost of a large part of the 1918 crop saved the Government from an anxious situation.

The areas of cultivation of mandioca, corn, cotton, sugar and cacao have all increased in recent years. Rice, once imported, is so extensively grown that imports of it have virtually ceased. Of cacao Brazil supplies the major part of the world’s demand, most of which is eventually taken over by the belligerent Governments. In 1917 the state of São Paulo, to stabilize the price which was threatened by a large crop and restricted markets, purchased 3,000,000 bags, and constructed enormous warehouses for their storage on the docks at Santos. The destruction by frost of a large part of the 1918 crop saved the Government from an anxious situation.

The destruction by frost of a large part of the 1918 crop saved the Government from an anxious situation.
Cotton is native to Brazil, and may be grown in all parts of the republic. The best cotton lands are in the centre and along the S.E. coast to the mouths of the Amazon, where the climate is suitable. In the northern part of the state, the raw cotton is produced on a large scale. The highest yielding varieties are those grown in the interior of the state of Minas Geraes, where the climate is mild and the soil is fertile. The cotton is ginned and marketed within the state, and a very small quantity is exported. The total production of cotton in 1919 was about 10,384,000 lbs., valued at $2,466,692.

Rubber is also an important product of the state, and is grown in the northeastern part of the state, especially in the region between the states of Para and Amazon. The rubber production in 1919 was about 2,417,095 lbs., valued at $2,160,000.

Minerals.—Brazil has a large number of minerals, including gold, silver, copper, iron, and manganese. The most important of these minerals are gold and manganese. The production of gold in 1919 was about 116,000 lbs., valued at $3,357,600. The production of manganese in 1919 was about 21,000 tons, valued at $950,000.

Cattle and sheep are the chief livestock of the country. In 1919, the number of cattle was about 14,144,400, valued at $19,427,000, and the number of sheep was about 2,100,000, valued at $2,466,692.

The exports of Brazil in 1919 were about $10,000,000, and the imports were about $11,000,000. The trade balance was therefore about $1,000,000 in favor of Brazil.

The commercial relations of Brazil with other countries are very extensive. The principal exports are coffee, sugar, and cotton, while the principal imports are machinery, manufactures, and raw materials.

Approximate figures for the year 1915 provide means of comparison with conditions before the outbreak of the War World.

Communications.—The railways of Brazil, aggregating 13,271 m. of track in 1910, had increased in 1917 to 17,159 m., with 2,223 m. under construction and 4,907 m. protected. The state of São Paulo, the largest railway mileage were São Paulo, Minas Gerais, Rio de Janeiro, Rio Grande do Sul and Bahia which together contain over 70% of the mileage of the Republic. Of the various systems is the Central of Brazil, a Government-owned and operated property, connecting the federalized district with the states of Rio de Janeiro, São Paulo and Minas Gerais. The total length of the line was 1,466 miles, and in that year carried 2,525,000 passengers, 2,388,000 tons of freight, and 350,000 head of live stock.

Owing to the widespread separation of the principal centres of population along the coast, Brazilian railways have developed as a series of independent systems. Thus Pernambuco became the focus of one system, Bahia, Rio de Janeiro, Santos, and Rio Grande do Sul of others. For some time the need was recognized of connecting the various systems by interior lines running N. and S., to afford communication independently of the sea, and to stimulate internal settlement and trade. Such plans have been carried out N. and S. of Pernambuco (from Natal to Macéio), and from Rio de Janeiro N. to Victoria and S. of the Uruguay frontier, where construction was made in 1913 with Uruguay Central. It is therefore possible to travel by rail from Rio direct to Montevideo, a distance of 1,967 miles.

Among the leading imports of Brazil are iron and steel manufactures, machinery, railway supplies, coal, kerosene, cement, cotton goods, foodstuffs, and raw materials and articles for use in the arts and industries.

The principal ports of entry are Rio de Janeiro and Santos, but Pará, Pernambuco, Bahia, Porto Alegre and Rio Grande have a large and increasing foreign trade.

Shipping.—The Brazilian merchant marine increased but slowly in 1910-20, except for the German steamers seized during the war. Brazilian shipping in 1911 consisted of 238 steamers of 130,828 tons net, and 290 sailing vessels with a net tonnage of 60,788. At the end of 1917 there were 405 steamers of 236,515 tons net, and 54 sailing ships representing 17,920 tons net. Brazil in that year took over all the German ships interred in her ports at the outbreak of war in 1914, a total of 45 vessels with a net tonnage of 149,253. Thirty were leased to France, the rest turned over to the Lloyd Brasileiro, which considerably expanded its foreign service, especially to the United States.
BRAZIL

In 1910 there were 36,199 m. of telegraph in Brazil which had increased to 41,798 m. in 1917, of which 24,640 m. belonged to the Government. In the latter year 860 telegraph offices were reported, and 35 radio stations. The station at Pará (Belém), which has a railway connection, is thus capable of direct communications with the United States. The station at Cape Santa Marta, with the same range, connects with Cape Town in South Africa. In 1911 a new trans-Atlantic cable was completed between Monrovia (Liberia) and the submarine cable was remotely controlled, and in 1919 an undersea cable was established with the United States, via Argentina and the W. coast. Brazil has now three cable lines connecting with Europe, two with North America, and two with the River Plate. The number of post offices in 1918 was 4,000, and in Jan. 1914 adopted standard time and the longitude of Greenwich.

Finance.—The following official figures are reported for 1919:—

Army and Navy.—The army is organized on the basis of compulsory military service between the ages of 21 and 44, under the terms of the Constitution of 1918. The navy is composed of battleships and destroyers, armed with the seven, seven in the second line, and eight in the national guard. By a decree of Dec. 1917 the national guard is incorporated with the second line. The total strength of the army (in December 1908) was 42,699, but in 1919 it would yield about 120,000. There is also a gendarmerie of 26,000.

The Brazilian navy in 1920 comprised two Dreadnoughts, two coast defence ships, three protected cruisers, two river monitors, four river gunboats, four small cruisers, four torpedo boats, ten destroyers, a mine ship, three submarines and a submarine salvage vessel. Five destroyers and three large submarines were under construction. The personnel comprised about 13,000 men.

Education.—The latest figures available in April 1921 gave the number of primary schools in the republic at about 13,000, with an enrolment of over 700,000. Of these schools about half are supported by the state Governments, one-fourth an acto municipal, and the rest by private institutions. Secondary and normal instruction is cared for by various institutions and private establishments, of which there are between three and four hundred attended by some 49,000 pupils.

The republic also possesses 28 industrial schools, 11 agricultural and 9 commercial schools. To further industrial education the Federal Government may aid the state Governments, or municipal and private schools which meet its requirements. It also maintains, in each state, at least one technical and professional school and a girls' school.

Political History.—Marshall Hermes da Fonseca, leader of the Conservative party and former Minister of War, was elected President of the republic in March 1910, over Snr. Ruy Barbosa. The latter part of the year was marked by serious disturbances in Rio de Janeiro and in the north. At Mandos, capital of the state of Amazonas, the governor was forcibly removed by the Opposition, aided by Federal troops and by the flotilla on the river, but was reinstated by order of the President of the republic. At Rio de Janeiro on the night of Nov. 22 the crew of two new Dreadnoughts, the "Minas Geraes" and the "São Paulo," mutinied in the harbour, killed several officers, and, training their guns on the city, sent a demand to the President for the abolition of corporal punishment, increased pay and shorter hours of labour. Four other ships joined the movement so that it included most of the Brazilian navy. As no response was received the city was bombarded next day, whereupon Congress granted a four per cent bonus on its capital and the mutineers meanwhile had put out to sea, but returned Nov. 27 and gave up the ships to the Government. On the night of Dec. 9, the marine corps stationed on Cabra Island in the harbour also mutinied. Their position was bombarded next day, the mutineers replying with shrapnel. After an action lasting ten hours, the rebels surrendered, having lost over 200 killed and wounded. The revolt was followed by reforms in naval administration, and by the dismissal of about 1,000 men. The Government had difficulty in maintaining tranquillity, owing to disorders occurring in the state of Bahia in Jan. which required the calling out of Federal troops, and in the autumn disorders threatened in the states of Paraná in the south and Pará in the north.

The death in 1912 of Baron Rio Branco, Brazil's most distinguished Foreign Minister for Foreign Affairs, withdrew an influential figure from South American politics. Through his efforts boundary disputes with several of Brazil's neighbours had been amicably adjusted and the territories of the republic considerably increased. He was succeeded as Foreign Minister by Dr. Luaro Marques, who was able to follow a policy of re-establishing relations with Portugal, making a special mission to the commission to survey the frontier in accordance with the Treaty of Demarcation of Sept. 8, 1909. On May 9 1913 the plenipotentiaries of Brazil and Uruguay agreed to a convention establishing a new frontier line between the two republics on the river San Miguel, and recognizing Brazil's navigation rights on that stream. A perennial difficulty was that of national finance. In spite of annual messages of the President to Congress urging economy and the re-establishment of a financial equilibrium, public expenditures increased in alarming proportion to receipts, resulting in heavy deficits occurring in the state of Bahia in Jan. which required the calling out of Federal troops, and in the autumn disorders threatened in the states of Paraná in the south and Pará in the north.

Before the end of 1915 adjustments had been made to new conditions and the economic situation became more normal. New customers were found, especially in the United States, and the high prices prevailing throughout the world encouraged exportation. National expenditure was much reduced, the national revenue increased by over $6,000,000, and a small surplus appeared in the budget, a most unusual state of affairs for Brazil.

In the course of that year there were important developments in the relations of Brazil, Argentina and Chile, the three countries constituting what was already known as the A.B.C. Entente. Dr. Cuauñ Müller at the end of April paid official visits to the other two republics as well as to Uruguay, to bring about closer
diplomatic, industrial and commercial relations. On May 23 a treaty was announced in which the countries of the A.B.C. undertook to submit to an international committee any differences that might arise among them, and not to open hostilities until the committee had concluded its labours. The treaty was ratified by the Brazilian Chamber of Deputies in Oct. 1916. The A.B.C. in the spring of 1914 had offered its mediation in the dispute between the Government of the United States and Victoriano Huerta, provisional President of Mexico. In Aug. 1915 President Wilson invited the A. B. C. Powers, together with Uruguay, Bolivia and Guatemala, to enter into a conference on Mexican affairs, the result of which was the unanimous recognition of Venustiano Carranza as "chief of the executive of the de facto Government of Mexico." Brazil also took a prominent part in the Pan-American Financial Conference held in Washington in May 1915, in an attempt to better existing financial conditions in North and South America.

The administration of President Braz, which ended in Nov. 1918, was from a financial point of view very successful. He succeeded in reducing public expenditures, restored special payment for internal debts, promoted the development of natural resources, and improved the economic relations between Brazil and her neighbours. Prices were high, but industry and commerce prospered and the exportation of Brazilian products so increased that the country was left with the largest trade balance it had ever known. In the national elections of 1918 there was no contest, the sole candidate for the presidency being Srs. Rodrigues Alves, a native of São Paulo and senator from that state, who had been President of the republic in 1902-6. The president-elect, however, was too ill to be inaugurated in Nov., and died on Jan. 12 1919, without assuming office. Another election was held in April to fill the unexpired term, and Dr. Epitacio da Silva Pessoa was chosen. Dr. Pessoa was then in Paris as chief of the Brazilian delegation to the Peace Conference. On his return journey in 1919 he paid official visits to England, Portugal and the United States.

From the outbreak of the World War in 1914, popular sympathies in Brazil had been almost wholly on the side of the Entente Powers, in spite of some annoyance caused by the British "black lists." The German policy of unrestricted submarine warfare announced early in 1917 forced the nation to assume an active share in the conflict. On Feb. 8 the Brazilian Cabinet dispatched a strongly worded protest to Berlin, declaring that the proposed "blockade" was contrary to international law and that Brazil would hold the German naval and economic consequences that might ensue to Brazilian shipping. A similar note was sent to Austria. On April 4 the steamer "Paraná" was sunk by a German submarine off the coast of France and several of the crew drowned. On April 10, after an inquiry into the incident, the German minister at Rio de Janeiro was handed his passports. In the crisis Dr. Lauro Müller, minister for foreign affairs, resigned his portfolio, apparently feeling that his German name and antecedents might embarrass the Government. Srs. Niló Peçanha, a former president of the republic, was appointed in his place. Rupture with Germany did not involve an immediate departure from neutrality, but with the sinking of another steamer, the "Tijuca," the drift toward war became more rapid. Late in May President Braz sent a message to Congress advising that neutrality be revoked, on the score that unity of action with the United States, now a belligerent, was a tradition of Brazilian foreign policy. On May 29 the Chamber of Deputies unanimously passed a bill authorizing revocation whenever the executive deemed the occasion appropriate. Congress also authorized the seizure of the German ships interned in Brazilian waters, aggregating nearly 150,000 tons. After the sinking of another vessel, the "Máximo," a state of war was formally declared Oct. 26 1917. Many anti-German demonstrations took place during the year, especially in Rio de Janeiro, São Paulo and Rio Grande do Sul.

Brazil, considering her immediate resources, gave valuable aid to the Allied Powers. Although the larger units of the navy had not been entirely renovated by the time of the Armistice, destroyers and other small vessels saw active service on both sides of the Atlantic. Many physicians and a few aviators went abroad to be attached to the Allied armies. The Federal Government in Dec. 1917 also promulgated a new military law, by which all citizens of the republic between the ages of 21 and 30 were subject to selective draft. But up to the cessation of hostilities comparatively few had been called out, because the Government lacked the means for adequate instruction and equipment.

As a signatory of the Treaty of Versailles, Brazil was one of the original members of the League of Nations, and became one of the nine Powers represented on the League Council.

BRÉAL, MICHEL JULES ALFRED (1832-1915), French philologist (see 4.981), resigned his chair at the Collège de France in 1905. He died in Paris Nov. 25 1915.

BREMEN, Germany (see 4.943). Pop. 311,266 according to the census of 1910; in 1918 it was 399,526. The economic life of the city state of Bremen in Germany was, in the period from 1908-14, in a state of high prosperity. The North German Lloyd attained its highest figures of emigrant traffic (107,122) in the first half of the year 1900. The number of emigrants carried was beginning to diminish about the year 1912. In the course of the years 1912 and 1913 the competition of the port of Emden, the Kiel canal and the Ostend road had been completed by the Prussian State, began to make itself felt. Bremen gradually passed from being a purely commercial city to a development as an industrial city, the result of which was to impose a heavy burden upon the finances of the city state.

Towards the middle of 1913, conflicts of interest arose between the North German Lloyd and the Hamburg-Amerika line; the North German Lloyd chose the path of more unobtrusive development of its business. The prospects of shipping, and therewith the prospects of the business expansion of Bremen, had begun to deteriorate as far back as the beginning of the year 1914.

The effect of the war was to paralyze almost completely the trade of the city seaport. Bremen was the first of the German states to introduce a tax upon war profits (May 1915). Attempts to consolidate the maritime traffic led, in the year 1916, to the establishment of the Bremen association for the import trade. On Aug. 25 1916 Bremen celebrated the return of the mercantile submarine "Deutschland" from its successful voyage to New York. Conflicts on the subject of the constitution began in April 1917. Bremen was the first town which, after Kiel, entered upon a revolutionary movement (Nov. 6 1918). The Workmen's and Soldiers' Council seized political power on Nov. 14. On Dec. 28 it decided to proclaim the political independence of the city state and to form a Socialistic Republic of Bremen with a council of commissioners of the people. On Jan. 28 1919 the Government of the Reich sent troops to deliver Bremen from the domination of the council. This force entered the city on Feb. 4 after protracted negotiations. Elections were held for the Bremen State Assembly on March 9, and a coalition government of the Socialist and Social-Democratic parties was formed. The new government was passed on May 11 1920. It conferred upon the Senate (as in Hamburg) political and administrative powers. Side by side with the democratic Parliament the following representative bodies were likewise established: A chamber of the working classes, a chamber of salaried employees, a chamber of agriculture, a chamber representing the retail trade, and a chamber representing the large commercial and wholesale interests. The constitution of Bremen contains a special declaration that the Church is separated from the State.

BRENTANO, LUDWIG JOSEPH [called Lujo] (1844-1908), German economist (see 4.496), was one of the German delegates sent over to London in Nov. 1919 to attend the economic conference convened by the "Fight the Famine" Council. At the first session of the conference, held at the Caxton Hall Nov. 4, he urged the organization and encouragement of German industry to enable Germany to fulfill her treaty obligations. His more recent publications include a pamphlet on the proposed League of Nations, and two short works, Ist das System Brentano zusammengebrochen? and Russland, der kranke Mann (both 1918).

BREST LITOVSK, BATTLES ROUND, 1915.—The operations round Brest Litovsk, from July 15 to Aug. 26 1915, formed an important part of Mackensen's campaign in Poland.
in the north-eastern offensive of the Central Powers that year (see Eastern Front Campaigns).

On the completion of the regrouping of Mackensen's group of armies, which now consisted of the Austro-Hungarian IV. Army, the German XI. Army, the German Army of the Bug and the Austro-Hungarian I. Army, the Central Powers had resumed the offensive along the whole front from the Bug to the Pilica. Mackensen, with three of the armies, was to direct the attack between the Vistula and the Bug. The main body of the I. Army was to cooperate in this attack on the eastern flank by delivering an assault in the direction of Vladimir Volinski, while the remainder of the army was to provide cover along the Bug up to the N. wing of the II. Army. The II. Army and the Southeastern Army were to cover this attack by landing their troops on the Vistula and the Zlota Lipa, and were themselves to attack only if this became necessary for the protection of the neighbouring armies or if the Russians showed signs of any dislocation of their forces. Woysch was to fall in with the IV. Army's offensive between the Vistula and the Pilica and, if occasion arose, to attack across the Vistula. Forcing the Dniester, the VII. Army was to push forward E. of the Stryja towards Czortkw and Buzzacze, and to force its cavalry attack in force E. of the Serech.

**Battles of Sokol, July 15-24, and Krasnostaw, July 16-9.** On July 15 at 11 A.M. Mackensen's attack began. On the very first day Puhallo's army made its approach all along the Bug, which, in spite of the high water-level, was forced on the 16th by a division of the I. Corps N. of Sokol. By that time the Army of the Bug had obtained possession of the positions between Terelin and Grabowiec, and Arz's Corps, on the right wing of the XI. Army, had stormed the very obstinately defended positions at Skierbielszow. The Guard Corps and the XXII. Res. Corps won the heights to the S.W. of Krasnostaw. The IV. Army was working steadily up to the Russians' strong main position. In spite of the dogged resistance of the Russians the fighting on the 16th was a victory for the Army. By the next few days, in and pushing on to the heights N. of the Zolkiewca. The I. Army meanwhile had taken Sokol, which was stormed by its I. Corps, and had constructed a bridge-head on the E. bank of the Bug. Farther N., Szumray's group gained the right bank of the Bug at Zdzary, and, on the S. wing, portions of the II. Corps the E. bank at Krystynopol.

Mackensen's right flank now appeared to be adequately protected, but for the present theattack on Vladimir Volinski was impracticable, on account of the Russian counter-attacks which soon developed and the limited strength of the I. Army. West of the Vistula, Woysch and the army group of Koenigs, which had been placed under him, had on the 16th begun an attack which led on the following day to the battle of Sienno of which the object was to break through the Russian lines.

On the 18th this attack ended in a complete victory. The Russian IV. Army evacuated its positions along Woysch's whole front, and retired to new defensive positions behind the Jizanka and S.W. of Radom. But here again the Russians were unable to stand against the powerful forward push, and were thrown back on to Zvolen by the right wing after heavy fighting. While Koenigs on the 17th was occupying Radom and advancing victoriously along the E. bank of the Pilica, the front N. of Zvolen was successfully pierced over a stretch of 2 km., and the Russians were driven back to the Vistula and to a kind of bridge-head position S.W. of Ivangorod. But on the same evening Woysch broke through these positions also, E. of Zalasy and at Czarnolas, and took possession of the heights at Janowice. All attacks launched by the Russians from the fortress zone at Ivangorod proved fruitless. Farther N. the Russian II. Army, being pursued by the German IX. Army, fell back on Grotjce and Blonie and the defences of Novo Georgievsk.

The successful battles of the XI. Army, the obstinate attacks by the IV. Army, and, not least, Woysch's menacing attack on the left bank of the Vistula, induced the Russians, although they had obtained all the reinforcements available, to retreat on the 19th. Pursued by the Army of the Bug, the IV. and the XI. Armies, they once more took a firm footing in new and well-prepared positions on the heights N. of Grubieszow, Rozana, Gardziecice, and N. of the Chodel, thus covering the railway line IVangorod–Lublin–Chelm. In the days that followed they made all possible efforts, reinforced by the XIII. Rifle Div., to drive the Austro-Hungarian forces at Sokol back across the Bug, but all their attacks, vigorous as they were, failed. All their assaults against the fronts of the XI. Army and the Army of the Bug—whose right wing had gained ground beyond Grubieszow towards the N.—were also unsuccessful, and they were driven back from the heights N. of the Chodel by the IV. Army along a front of about 40 kilometres.

The general effect of these successes on the Allied attack was to change the situation, for the moment, in the fighting. The Russians had established themselves in strong positions, and brought up fresh forces. It seemed equally urgent to overhaul the Allied forces, and fresh preparations were also necessary before the renewal of the attack. While the pause lasted the allies strengthened their positions against new Russian counter-attacks.

Within the next few days the right wing of the Army of the Bug pushed forward up to the carriage road running from Horodlo to Woj选址ome. The Russians renewed their embittered attacks on the bridge-head at Sokol, but without any success whatever. Certain portions of the I. Army proceeded in taking the obstinately defended height of Gora Sokol. The II. Army was able to establish its 32nd Infantry Div. to the E. of Kami-onka Strumilowa on the right bank of the Bug.

Meanwhile Woysch's army was making due preparations for the crossing of the Vistula. Kovoss's group, the XII. Corps and the 7th and 9th Cavalry Divs. remained beside the Vistula from Janowice to the Pilica estuary, while the Landwehr Corps with the Bredow Div. moved behind the left wing of the army. Aided by the self-sacrificing efforts of the Austro-Hungarian and German pioneers, who suffered many losses through the entanglements, the Landwehr Corps and the Bredow Div. crossed the river on the 28th in five places between Kołylnica and Tarnów, fighting fiercely, and established themselves at Maciejowice on the opposite bank.

**Battles of Chełm (Kholm) and Lutynia: Capture of Transtorped and Warsaw (July 29-Aug. 4).** On the 29th the offensive was resumed on Mackensen's whole front. The main blow on Biskupice was to be delivered by the XI. Army, on whose right the Army of the Bug was to continue the attack on Chełm.

The IV. Army was to cooperate with the attacking group of the XI. Army by pushing up its strong right wing through to Lublin. At the same time, led by Gen. von Emmich, broke through the Russian front in the battle of Biskupice (July 29–30), and an advance was made to beyond Olseniki, where the right bank of the Wieprz and the bridge of the railway leading to Chełm were taken. North of Krasnostaw the Guard Corps joined in the battle, but without winning any immediate success. The IV. Army was for the time being able to come only as far as the Russian wire entanglements.

In consequence of the reviving offensive, and also probably of the ever-increasing pressure of the German armies on the Bohemian front, the Russians once more evacuated their positions E. of the Vistula early on the 30th, their only weakness was the attempt made on Grubieszow. The XVII. Corps of the IV. Army, after overcoming the seven-fold wire entanglements, made five successive assaults on the Russians during the night of the 30th. In the afternoon the cavalry of the XVII. and IX. Corps rode into Lublin unopposed. The XIV. Corps advanced to the heights N. and E. of the town, and the IX., X. and VIII. Corps captured the heights S. of Snopok and approached the road running through Markusów Konkowola and Nowo Aleksandrya. On the following day these successes were everywhere extended by violent fighting. In the IV. Army the German 47th Res. Div. at Kurov flung itself across the road named above, and the left army wing moved towards Nowo Aleksandrya.

On Aug. 1 the Russians continued their retreat step by step, losing heavily. They also left the Bug below Krylów. In the
pursuit Puhalle’s whole left wing pushed forward over the Bug below Zdzary, and up to the hollow S. of Ustilug. The Army of the Bug established itself along the Bug from this point to Dubienko, while the Beiskiden Corps, fighting on its left wing, pursued the Russians beyond Czelm. The XI. Army came upon fresh opposition in the line Kulik–Leczna, and in front of the IV. Army the Russians were able to maintain the positions to which they had retired after the abandonment of Lublin. 

West of the Vistula great events were in preparation at this time. Kövess’s Transylvanian troops captured, by a vigorous attack on Aug. 2, eight concrete entrenchments on the front of Varnograd, and the four were later taken by the IV. Army. The Landwehr Corps, too, penetrated into the enemy’s positions at Domaszew. The successes of this group assumed for the Russians an even more threatening aspect. On the one hand the railway between Warsaw and Ivangorod would be in serious danger if the Landwehr Corps pushed their advance any farther; on the other the enveloping of Ivangorod’s N. front would admit of considerable pressure being brought to bear on its defenders.

In the next few days Mackensen’s group of armies by their tenacious attacks ousted the Russians from one position after the other. The Russian First Army, which had been left being hemmed in more and more closely, tried in vain by counter-attacking to obtain breathing space and relieve the pressure. While Mackensen continued his irresistible advance between the Bug and the Vistula, and Prince Leopold of Bavaria and Woyrsch were on the point of taking Warsaw and Ivangorod, there were signs in the N. also that the fortresses on the Bobr–Narew front were doomed. Pulinsk and Rozan had been taken by Gallwitz’s Army, and Ostrolenka was seriously threatened. Farther N. the VIII. Army (Scholz’s) was equipping itself to attack Lomza and Osowiec, while the X. Army (Eichhorn’s) and Below’s Army of the Niemen were advancing on Kovno and Riga. The Russians were, no doubt, considering the abandonment of their front on the Vistula; and they had begun to send off their war material and the enormous food supplies needed to support the armies during a retreat which was to be only gradual. But in spite of all the strength they displayed they were being constantly forced backward. On the 3rd, Leczna was captured by the left wing group of the XI. Army. The cavalry of the I. Army entered Vladimir Volinski, and Szczawi was nearing the Luga. Aug. 4 crowned all previous successes. The forces of the Russian III. and XV. Armies of Bavaria threw the Russians out of both the outer and inner ring of Warsaw’s forts, and, after the Russians had evacuated the town and withdrawn to Praga on the right bank of the Vistula, made their entry into the town. Simultaneously the western quarter of Ivangorod on the left bank of the Vistula was taken by the XVI. Infantry Div. of Kövess’s group, while the garrison retired to the right bank and blew up the Vistula bridge.

The IV., XI., and Bug Armies, continuing the pursuit, forced back the Russians, in spite of violent resistance, behind the line Sawin–Baranów–Osius. The left wing of the IV. Army advanced to the heights N. of Konkowola. The Battle at Lubartow, Aug. 5-8,-When the Russians began their retreat from the Vistula position between Warsaw and Ivangorod it fell upon Mackensen to deliver his blow on the left flank of the retreating army. His desire was to push forward with all possible speed beyond Parczew to the railway line running from Warsaw to Brest Litovsk. The I. Army and the Bug Army were to cover the attack by holding the bridge-heads constructed on the E. bank of the Bug. The Bug Army removed its right wing to Dubienko and was to advance with its left on Wlodawa and across the Włocławka. The IV. and XI. Armies, whose attacks were to be continued, were to reach the Tysmenica and Wieprz section as quickly as possible. As a guiding line for the inner wings of both armies Mackensen selected the river bed of the Wieprz.

The shifting of the XI. Army, which now became necessary, was made possible by the transference of the Beskiden Corps from the Bug Army to the rear of the XI. Army’s right wing. The troops occupying the stretch of the Bug below Ustilug could now gradually loosen their hold, for here the Russians, under pressure of what had occurred, were retiring by successive stages on Kovel. They were being pursued for the moment only by the I. Army cavalry.

On the IV. Army devolved the task of attacking the strong positions at Lubartow within the next few days. By the 6th it was able to take the Russian trenches S. of that place, and at Brzostowka and Krasny German troops penetrated into the Russian positions. On the 7th the decisive blow was given by the attacking group on the army’s right wing, composed of several divisions of XVII. and XVIII. Corps, commanded by Lt.-Field-Marshall Roth. The enemy was driven out of several lines, lying one behind the other, during the morning, and in the afternoon and evening this group, with the XLI. Honved Infantry Div. and the XI. and III. Infantry Divs., pushed their way to beyond Firley, driving a wedge into the Russian front. The Russians fell back in complete disorder across the Wieprz. Meanwhile the X. Infantry and XLV. Light Infantry Divs. had crossed the Wieprz to the N.E., at and N. of Baranówka, in order to join in the battle of the XI. Army, which was also being assisted by heavy artillery fire in the direction of Brest Litovsk. The advance of the Rudno–Kamionka road the XVII. and IX. Corps also joined in. Here the Russian XXV. Corps had advanced from the area S. of Michów to a counter-attack on the Austro-Hungarian X. Corps, which after a hard struggle succeeded in forcing the enemy back to the Lower Wieprz and snatching from him some of his points d’appui. The immediate effect of these battles was the evacuation by the Russians of the Vistula bank N.W. of Ivangorod also. Thereupon Kövess and Woyrsch took up the pursuit on both sides of the Sololow–Zalechow road. On the 8th and 9th the pursuit of the hurriedly retreating enemy was vigorously carried on. The IV. Army crossed the Wieprz close to its estuary and also at Leszkowicz. On the 9th, too, the Bug Army and the XI. Army penetrated the enemy’s lines at several points after extremely heavy fighting, but on the 10th they again encountered the greatest resistance.

Woyrsch and Kövess crossed the Warsaw–Lublin road and went in pursuit of the Russian IV. Army, which was falling back on Łuków and Radzyn. The Archduke Josef Ferdinand’s Army now advanced also on the N. bank of the Wieprz, and, on the 10th, reached the region N.W. of the Lower Tysmenica and the area in the bend of the Tysmenica; the Ermisch group, fighting to the west of the XI. Army, approached the Upper Tysmenica in its pursuit of the Russian IV. Army’s left wing. On Woyrsch’s left were the German IX. and XII. Armies, the latter of which, coming from Gallwitz’s Army, had penetrated to the Bug and the area of Sadlo, Kaluszyn, and Ceglów. Up to Ossowiec all the fortresses of the Bobr–Narew line had fallen. Novo Georgievsk alone still held out, but around it Gen. von Bessel was drawing his siege-ring ever closer.

The Brest Litovsk Offensive.—The IV. Army’s flank attack on the Russians retreating eastwards had in the last few days changed into a frontal pursuit in a north-easterly direction, carried out in conjunction with Prince Leopold of Bavaria’s group of armies. For the XI. and Bug Armies, however, Mackensen still held to the proposed flank attack, to be delivered in a northerly direction.

The S. wing of Hildenburg’s group of armies (the German VIII. and XII. Armies) and the two groups of Prince Leopold of Bavaria and Mackensen were forcing back the Russian main force ever farther towards the Biłastyńko–Brest Litovsk railway line. This main force was composed of the XII., I., II., IV., and III. Armies, and counted roughly 60 infantry and 7 cavalry divisions. Mackensen’s part in the great scheme of operations was to attack the southern portion of this section of the railway, which had the support of the powerful Brest Litovsk fortress. Within the area which it sheltered, down the Bug as far as Janów, the Russian III. Army, with about 141 infantry and 2 cavalry divisions, made its retreat, while the Russian IV. Army took the direction of Janów and approached the Bug from the north-west. On the 22nd the III. Army, between the Bug and
the Tysmenica, gave up the resistance and fell back step by step through Macoszyń, Hola and Parczew, followed by the XI. Army and the left wing and centre of the Bug Army. The right wing of the IV. Army remained in the bend of the Tysmenica, the centre and left wing crossed the Bystrzyca and came towards the Białka section and Kadzyn. Kövess and Woyrsch advanced by way of Łuków and Siedlce.

As the offensive progressed the allies' front had become considerably shorter. For whereas the length of front in the middle of July, at the beginning of the offensive, had been about 720 km, long from the German VIII. Army's left wing at Ossowiec to Mackensen's right wing, it had by the middle of August been cut to the extent of 480 km. The armists drew closer together, and it thus became possible to relieve the fighting troops more frequently and also to withdraw whole corps and throw them into the battle at another point.

On the 13th the vigorous pursuit of S. W. and W. of Brest Litovsk gained considerable ground. The IV. Army advanced in the general direction of Biala, the XI. steered straight for Brest Litovsk and sought its way to the region round Opole, and the Bug Army pushed forward its left wing as far N. as Hanna on the Bug. On the following day the Russians offered renewed resistance, but fell back again still farther early on the 15th, after the Guard Corps, reinforced by the XIX. Infantry Div. and the X. Reserve Corps, had penetrated their lines S.E. of Razwiedowka and at Gorodyseaże respectively on the 14th, and the IV. Army had also successfully attacked their positions. The advance by way of Lubień in front of the ever-lengthening front of the Bug Army and, taking up its position on the army's right wing, undertook the protection of the Bug in conjunction with the I. Army at Dubienka.

On the 15th the XL and IV. Armies reached to Tuczna and the area S. of Biala in their pursuit. The left wing corps of the Bug Army gained the cross-roads N.W. of Sławatycze. Early on the 16th portions of the IV. Army crossed the Krzna hollow and established themselves N. of the road leading westward from Biala. To the N. of the IV. Army Prince Leopold of Bavaria's group of armies, with Woyrsch's Army and the Kövess group, reached the Bug N. of Konstantynow, and the IX. Army crossed over in the direction of Lenietyce.

On the 17th the XI. Army had come up so near to the outlying positions of Brest Litovsk that the Guard and the Austro-Hungarian VI. Corps, who were to invest it, could now move into the blockade position S.W. of the fortress on the line Okezyn–Dobrynka–Łachowa. The X. Reserve Corps established itself E. of Janów on the Bug, and the XXII. Reserve Corps pushed in between that corps' right wing and Łachowa on the front facing east. At Włodawa the Bug Army built out a bridgehead. The main body of the IV. Army was assembled N.W. of Janów and crossed across the Bug at the N. bank of the Bug. The left wing was opposite Niemirow, where the VIII. Corps was fighting its way across the Bug. Adjoining was Kövess, who had taken the N. bank of the Bug between Niemirow and Mielenik, and was continuing the advance in conjunction with Woyrsch and with Prince Leopold of Bavaria's group of armies, which had reached Zerdyczce.

The Bug Army, to which Arz's Corps had been added, and which now stretched as far as Krzna with its left wing, took the offensive across the Bug in a N.E. direction starting from the Włodawa area. In the battle of Włodawa the German I. Infantry Div. broke through the Russian positions on the 19th and pushed forward, followed by the XXII. Infantry Div. to Piszcz. The XXIV. Reserve Corps attacked Dubok and Czersk—for the time being without success. At Sławatycze on the E. bank of the Bug the Russians put up a very strong resistance. They were concerned at this point to delay the advance as long as possible.

The Russian XXIX., XXXIII., and II. Caucasian Corps were to take advantage of the protection of the lakes E. of Włodawa to bar the approach to Brest Litovsk. But the retreating movement of their train columns, and the withdrawal of troops in the general direction of Kovel, Kobryn and Pruzany, pointed to a flight to gain time, which would have to be cut short by the I. Army and the Bug Army in a vigorous attack. On the N. wing of the Bug Army no change took place that day as regards the Russian positions at Brest Litovsk, but the XI. Army gained ground N. of the Krzna in the direction of Kołczyn. The Russians, attempted, by repeated counter-attacks, to delay the pressing pursuit of the allies until they should have had time to cross the Bug. The IV. Army succeeded in advancing as far as the Pulwa.

In face of the right wing attacks of the Bug Army the Russians had established themselves on the 20th along the Kapajowka. Arz's Corps, before Brest Litovsk, forced the Russians back on both sides of the road leading from Biala to the fortress, to beyond the area N. of Dobrynka. In the zone of the XI. Army the angle of the Bug at Krzna was almost completely cleared by the XXII. Corps. The X. Reserve Corps pushed across the Bug at Ogrodzniki without meeting with any great opposition. The Archduke Josef Ferdinand's Army and the Kövess group encountered renewed violent resistance on the line Wolczyn–Wola–Tymianko. After hard fighting the Russians were driven farther back. The investing troops of Brest Litovsk also gained some ground.

On the 22nd the XI. Reserve Corps of the Bug Army, after making their way through the lake defiles, reached the region E. of Oriechowo, and on the 24th, together with the XXIV. Reserve Corps, advanced to the line Złumin–Mielnik after fierce fighting. The Beskiden Corps and Arz's Corps meanwhile were advancing by step by step to the particularly powerful positions and forts of Brest Litovsk. The XXII. Reserve Corps and the X. Reserve Corps of the XI. Army were also fighting hard to repulse the Russian counter-attacks. On the 24th Arz's Corps and the Beskiden Corps succeeded in penetrating the Russian lines in several places and in forcing back the Russian garrison (III. and V. Corps) behind the permanent ring of forts. In the meantime the XI. Army, fighting furiously, advanced over the Bug to the line Nalep–Minkowice, and threatened the fortress from the north. Meanwhile the XII. Corps of the Kövess group had broken through the Russian front, driven the Germans back, at Krzna, and had wrested from it the Pulwa position. A vehement fighting pursuit was carried out by the IV. Army and Leopold of Bavaria's Army group as far as Minkowice–Backinka. The S. wing of the German XII. Army pushed forward with the IX. Army to the swampland of the Orlanka.

Capture of Brest Litovsk (Aug. 25–9).—On the 25th the XXXIX. Honved Infantry Div. of Arz's Corps broke through the outer ring of forts at Kobylany, S.E. of the railway leading from Biala, and took the fort from the rear. The positions on both sides of the road coming in from Biala were also stormed. The XII. Infantry Div. of this corps captured a fort S. of Koroszczyń, and the XXII. Reserve Corps took the place itself and several forts on the N. front of the fortress, after which the Germans advanced to the railway bridge and drove the Russians back into the citadel.

Farther N. the Guard Corps and the X. Reserve Corps pushed the Russians back to the Lesna, which river was crossed by the Guard Corps on the 25th to the N. of Brest Litovsk. The IV. Army and Prince Leopold's group beat the Russians back to Kamieniec Litowsk and the Lesnaja marshes. After the hard battles fought on the 25th around the fortresses, which culminated in the capture of the redoubt by the XXII. Reserve Corps and Arz's Corps, the Russians, on the 26th, abandoned the fortress and withdrew to the Ryta and the Muchawiec section, closely pursued by the Bug Army and the XI. Army. In the Bug Army the XI. Reserve Corps and XXII. Infantry Div. pushed forward on both sides of the road from Włodawa to Kobryn, to beyond the road leading E. from Brest Litovsk. Gerok's Corps gained the Ryta section, and the Beskiden Corps, advancing along both sides of the road from Brest Litovsk to Kobryn, reached the Szebrzyn region. The VI. Corps remained in the fortress and was once more put under the XI. Army command. The XI. Army advanced in the area.
N. of Brest Litovsk as far as the line Sakil-Polischze, and by hard fighting drove out the Russian rearguard. In the IV. Army, portions of the XXXVII. and XLI. Honved Infantry Divs. had occupied a sort of bridge-head position E. of Kamieniec Litowsk on the Lesna. The main body of the army (the VIII. and XVII. Corps) concentrated at Monaczki and Zadowrany in readiness to withdraw bodily from the front as soon as its troops stationed E. of the Lesna should be relieved.

The fall of the Brest Litovsk fortress and the simultaneous capture of Białystok by the German VIII. Army compelled the main force of the Russian N.W. front to retreat.

The Austro-Hungarian I. Army’s Offensive at Kovel (Kovel).—The Austro-Hungarian forces transferred from the IV. Army (the IX., X., and XIV. Corps) to the I. Army gave the signal for a renewed offensive advance by the I. Army. If an advance in the direction of Kovel were made, and the Russians were driven E. and W., the result would be to divide the Russian N.W. from the S.W. front. The impassability of the Poliesie, lying between the two fronts, was an appreciable aid to this separation. The offensive was opened on the 10th against the Russian XXXI. and IV. Cavalry Corps by Heydebreck’s Cavalry Corps, of which the Austro-Hungarian IV. Cavalry Div. reached the Dubrauca area and the XI. Honved Cavalry Div. the locality of Luboml. On the 18th, in a further advance, the German V. Cavalry Div. reached Boby, and the Austro-Hungarian IV. and XI. Olesk and Ruda, while infantry detachments of the IX., X., and XIV. Corps followed, moving concentrically up to Mokrec and Luboml.

On the following day the Russian XXXI. Corps took up a position to meet them on the line Turysk—Nowosolka—Ruda, whereupon the whole II. Infantry Div. was brought forward to Solovitsze. On the 22nd, together with the Cavalry Corps, it engaged in fierce fighting at Macejowa and Turysk, and drove back the XXXI. Corps on Kovel. The main body of the Russian XXXI. Corps attempted to join the Russian III. Army to the N. by way of the Priput. The Russian IV. Cavalry Corps was aiming at a similar junction through Kamien Kaszyszyi. In their retreat the Russians had undertaken a regrouping of the N.W. front’s S. wing in the area N. and S. of Poliesie. The XIII. Army, which had been fighting on the S. wing, was disbanded. The army command with three of the corps were transferred to other fronts, and the remaining four corps incorporated with the III. Army defending Brest Litovsk.

On the 24th the German V. Cavalry Div. and the Hungarian XI. Honved Cavalry Div. took up the pursuit of the N. the IV. Cavalry Div. to the east. The separation of the N.W. from the S.W. front had been accomplished. Up to the end of Aug., Mackenzen, who after the fall of the fortress had again been placed under the Supreme Army Command, carried the pursuit up to Kobryn and Pruzany; Prince Leopold of Bavaria’s and Hindenburg’s S. wing (the XII. and VIII. Armies) advanced along the roads to Wolkowica and Grodino on to the line Pruzany–Jalówka–Nowinka Nowydwor and Sopockline, and the Austro-Hungarian armies attacked the S.W. front together with the German S. Army.
